

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

HONEST TOM; A PRIZE SHIRE STALLION.

THE PROPERTY OF MR. WILLIAM WELCHER, OF MOUSE HALL, WEST TOFTS, BRANDON, NORFOLK.

Honest Tom, a bay horse, bred by Mr. Welcher, in 1865, is by Tibbett's Thumper, out of Beauty by Hammond's Emperor, a well known prize horse, by Duck's Matchless. Beauty herself at the last Watton and Wayland show won the silver cup as the best cart mare on the ground.

Tibbett's Thumper, a frequent prize taker in his day at Huntingdon and Peterborough, was by Eagle Thumper, a son of Steward's Major, and so back to Purrant's Honest Tom and Goodman's Honest Tom.

The following prizes have been awarded to Honest Tom:

ROYAL PRIZES.

First prize at Royal Society Meeting at Bury St. Edmund's, July, 1867, against 13 competitors	£	s.	d.
First prize at Royal Society Meeting at Leicester, July, 1868, against 9 competitors	20	0	0
First prize at Royal Society Meeting at Manchester, July, 1869, against 11 competitors	25	0	0
First prize at Royal Society Meeting at Oxford, July, 1870, against 20 competitors.	25	0	0

COUNTRY SHOWS.

First prize at Cambridgeshire and Isle of Ely, at Wisbech, Sept. 28, 1867	6	0	0
And Special Prize, Silver Cup, value	20	0	0
First prize at Huntingdonshire Meeting, at Huntingdon, March 27, 1868	15	0	0
First prize and Silver Medal at the Norfolk Meeting, at Downham, June 18, 1868	10	10	0
First prize at Cambridgeshire and Isle of Ely, at Newmarket, July 1, 1868	10	0	0
And Special Prize, Silver Cup, value	20	0	0

First prize at South Lincolnshire Meeting at Grantham, July 24, 1868.	£15	0	0
First prize at the Town of Long Sutton, Lincolnshire, October 28, 1868	3	3	0
First prize at Lincolnshire Meeting, at Lincoln, July, 1869	20	0	0
Second prize at Yorkshire Meeting, at Beverley, July, 1869	7	0	0
First prize at Birmingham Horse Show, August, 1869	30	0	0
Second prize at Norfolk Meeting, at Harleston, June, 1870	7	0	0
First prize at Cambridgeshire Meeting, at Royston, July, 1870	10	0	0
First prize at Lincolnshire Meeting, at Sleaford, July, 1870	20	0	0
First prize at Watton and Wayland Meeting, at Watton, Silver Cup, September, 1870, value	10	10	0
	£299	3	0

In his report on the Royal Meeting at Manchester, Mr. Wells, M.P., the senior steward says: "Honest Tom was conspicuously the best animal, and deserved his honours even more than he did at Leicester. He has greatly improved since then, and grown into a fine specimen of a Shire cart-horse stallion;" and Mr. Manfred Biddell, one of the judges at Oxford, thinks him "a remarkably good animal." We once, however, on the confines of Mr. Biddell's own county of Suffolk, saw Honest Tom sent away in an all-England class with nothing more than a mere commendation, though this could never have happened had there not been a majority of Suffolk judges on the bench.

PLATE II.

A "ROYAL" COTSWOLD.

THE PROPERTY OF MR. THOMAS BROWN, OF MARHAM, NORFOLK.

Lord Lyon 2nd, a shearling Cotswold ram, is by Lord Lyon, bought of Mr. Robert Garne in 1866 for 120 gs., dam by Sir James, bred by Mr. Jas. Walker, and a winner of 1st prize at Canterbury R.A.S. 1860, grandam from Mr. Robert Lane's flock.

As a lamb Lord Lyon 2nd, in 1869, with his partner, won 1st prize at the Attleboro' meeting of the Norfolk Agricultural Association.

In 1870, at the Harleston meeting of the same Society he won 1st prize in his class, and the extra prize as best Longwoolled sheep in the yard. At the Oxford meeting of the Royal Agricultural Society of England he won the first prize.

Mr. Brown has favoured us with the following neatly-told history of his Cotswold flock :

Having from the time of my first turning my attention to business been a lover of the sheep I, about 1850, began to cherish the idea of breeding a few Longwoolled rams for my own use. I was then keeping a flock of Down ewes bred by Mr. H. E. Blyth. In 1853 a neighbour, who was giving up his Longwoolled flock, kindly allowed me to select therefrom ; and, accordingly, I started with 88 ewes. A very few years' experience proved to me the impolicy of keeping two flocks. I hesitated which to dispose of. My most intimate friends advised me to sell the Downs and to become a ram-breeder, urging amongst other reasons the breaking-up and decline of two or three old-established flocks of Longwoolled sheep in the county. Their counsel coinciding with my inclination, in 1856 I sold my Down ewes to my father-in-law, largely increased my Longwoolled flock, and became an exhibitor at the meetings of the Norfolk Agricultural Association. For several years my sheep were unnoticed by the judges ; I therefore determined to try a Cotswold Ram ; and in 1860 I bought the shearling ram to which was awarded (I being one of the judges) the first prize at the Canterbury meeting of the Royal Agricultural Society. With his produce I found the road to success ; for in 1862, at Dereham, I gained the three prizes for shearling rams and the first for shearling ewes ; and in 1863, at Great Yarmouth, *all* the prizes save one (a third) ; while since that time I have obtained the great majority of the prizes for Longwoolled sheep offered by the Norfolk Society. I was soon urged, notably by the late Mr. A. Hamond, to become an exhibitor at the Royal shows ; but my constant attendance at its meetings had plainly shown me that my Leicester-Lincoln-Cotswold sheep, however successful in Norfolk,

would stand no chance with the pure breeds. I desired to maintain my position in Norfolk, and to exhibit at the Royal ; therefore, I determined to have a pure breed of Longwoolled sheep. My choice laid between Lincolns and Cotswolds : the Lincolns were reputed to cut the most wool, whereas the Cotswolds were superior in form and came earlier to maturity. I decided for the Cotswold ; having come to the conclusion that with care and attention a Cotswold flock on my upland farm would cut as much wool and of as good quality as a Lincoln. Seven years experience has strengthened that opinion.

In 1863 Mr. Robert Lane, of the Cotage Farm, reduced his flock : one of the oldest, most noted, and successful on the Cotswold Hills. I became a purchaser, giving ten guineas each for some of his ewes ; and in about five years time I find I bought 480 Cotswold ewes ; a few from Mr. Robert Garne and others, but the greater part from Mr. Robert Lane.

I began to exhibit at the Royal meetings in 1867, and the following is a list of prizes gained thereat :

1867, Bury St. Edmunds.—First and second for shearling rams, first and second for old rams, and first for shearling ewes.

1868, Leicester.—First for shearling rams, third for old rams, and second for shearling ewes.

1869, Manchester.—Third for shearling rams, first and second for old rams.

1870, Oxford.—First and third for shearling rams.

I have not shown shearling ewes since 1868 and probably shall not again show any. During the last decade I have used rams from Messrs. Robert Garne, Robert Lane, William Hewer, and William Lane. Twice I have given 120 guineas, twice 101 guineas for a sheep.

I began ram-breeding, as I have stated, in 1853 with 88 ewes. As my flock increased so did my customers, till I now annually let and sell, for breeding purposes, about 350 rams and ram lambs.

In our own report of the Royal Oxford meeting we spoke to "the Marham shearling as a very handsome sample of his kind, with a good fleece, a true frame, and a capital countenance ;" while one of the judges writes of him "as a particularly good sheep." The flock was in immense force here, as Mr. Brown took not only the first and third prizes, but the reserve number and another high commendation ; his old tutor Mr. Robert Lane separating the Norfolk-bred sheep for second place.

THE SMITHFIELD CLUB SHOW IN THE AGRICULTURAL HALL.

THE OPENING MORNING.

Immediately on the conclusion of last meeting we called attention to "the unsatisfactory, not to say disgraceful condition" into which the conduct of the Smithfield Club Show was gradually drifting. We pointed out the unwholesome fact that exhibitors, their relatives, agents, or herdsmen, got into the Hall before they had any right to be there; that the reporter of one daily Paper appeared to have the run of the place long previous to his fellows, and that he gratefully availed himself of the opportunity to write up the wares of some of the Agricultural Hall people. It further appeared that persons were in the habit of passing themselves off as implement makers' assistants, when they were nothing of the kind; while so far as the Press went we stood very much alone in advancing these charges. It was "only fault-finding for the sake of fault-finding," and so on.

Nevertheless the Council of the Club has thought fit to attempt a very radical reform. Some of our daily contemporaries have, as usual, supplied some of the earliest intelligence, evidently gathered up about the gateways, and, as it would seem, under the greatest possible difficulties. *The Telegraph* calls the Club "A Conservative Institution"; and *The Times* tells us how "So determined have been the Club authorities to prevent any information being obtained that it was stated detectives in plain clothes had been employed to prevent the intrusion of any stranger whatever into the area where the live stock is located until the judges made their awards on Monday. Even exhibitors are not allowed beyond the threshold after depositing their stock, and the implement exhibitors are barricaded in the galleries, and are compelled to find ingress and egress by a special door in the Liverpool Road." Nothing of course could come better than this, and so we proceed to read of such "prodigious" pieces of news as that the Queen and the Prince of Wales have made entries—that a number of the animals exhibited at Birmingham will be brought on to Islington—that the arrangements are under the direction of Mr. Brandreth Gibbs, and that the show, as usual, is the largest and finest that ever was known!

With the exception of the pigs, where the competition in most of the classes is small, and amongst which there has been some unusual mortality, the Show certainly looks to be larger than of late, although the quality is as indisputably but moderate. There is not an animal, at least in the cattle classes, of any extraordinary merit, and many of the best beasts at Birmingham are again the best at Islington. Not that the law as laid down last week is followed so continually here, as, indeed, there are some rather emphatic corrections to the first reading. For instance, Mr. Smith's steer, the first of his class, the best of all the Devons, and in the opinion of Mr. George Turner the best beast in Bingley Hall, takes no prize whatever in the Agricultural Hall. We stated in our report from Birmingham that this was a big, meaty, well-covered steer, with capital flesh, but by no means so smart nor so bloodlike as a North Devon should be; and again, "if ever it comes to a Champion from this lot of Devons in London we certainly do not expect to see Mr. Smith's steer again at their head." Mr. Senior's beautiful heifer, on the contrary, was again the first of her class, with Mr. Burton and her Majesty reversing their several places, as they previously had done

at breeding shows. The youngest class of steers of any sort never makes much mark, as the picked beasts are commonly kept for another year, nor is there any exception to this in the present show; but the two classes of older Devon oxen are both commendable, as better than they were at Birmingham, the winners in the Midlands never getting so forward here, and Mr. McNiven showing some fresh beasts, and another cow. Before the final award, the two best appeared to be Mr. Taylor's ox and Mr. Senior's heifer.

The Herefords were altogether in more force than at Birmingham, and the class of oxen contained some very good beasts, set off by a few but moderate; while it is noticeable that beyond Mr. Price's steer, which was third again in his class, none of the prize Hereford oxen or steers of last week were successful here. The first, second, and third heifers on the contrary were precisely in the same places here; and two of the Hereford cows were again winners, although Mr. Hill now separated them on the list. Our Birmingham report will of course speak to all this business.

The Shorthorns were a very tolerable collection, and nothing more. Amongst the juveniles, Lord Aylesford's steer was once more first, but the competition was small and bad; Mr. Searson's white reaching deservedly to a better place than at Birmingham, even in better company. With the crack ox well out of the way, amongst the extra stock, Mr. Joseph Stratton's was now deservedly the best of his class, with the Scotch ox again second, and Mr. Stratton's "big brother" third. Amongst the Shorthorn heifers, however, the Burderop Herd entered one of the plums of the Exhibition in Peeress, previously well-known at our great breeding shows, and but for having been thrown back from foot-and-mouth disease, that would surely have been the best of all the cows or heifers. Curiously enough, Mr. Reid's capital heifer, the best of her class, and that, *but* for the Shorthorn judge, would have been the best of all the females at Birmingham, was now only third, so that this fact alone gives Peeress a character; while the two Scotch heifers reversed their places, Mr. Hunter still being second. There was also the same sort of alteration amongst the cows, but we prefer the previous decision, although no doubt it would be always, a near thing between them. Mr. Torr's 200 ga. cow, Guiding Light, took no prize.

Mr. Montefiore showed a very good ox, but the Sussex scarcely ran up to their form of late, and Mr. Lee Steers has lost his lead. The two best Highlanders in the Midlands were now without places, and the class of oxen was altogether superior; while Mr. Harris' capital specimen, one of the best seen for some time, was of course still the best of the Scotch Polls; but Mr. M'Combie's high bred heifer, certainly rather flat-sided, lost her place, and of course with it the chances for further honours; the best ox and the best cow at Birmingham being both here amongst the extra stock; but the Devon cow, almost as glaring a mistake or piece of prejudice as the best Devon steer, had now of course no chance. The crosses included some capital beasts, of which the best ox showed a deal better out than in; and the award in his favour was not much fancied.

Lord Berners is still invincible for Leicesters; there were but few Cotswolds, with Mr. Hall still showing the best; and an admirable class of Lincolns that was generally commended. Lord Wal-

ingham maintains his supremacy with the Southdowns, although the judges took a deal of time to settle the light weights; perhaps the best test of a real Southdown at a fat show. The Shropshires were not very numerous, and our prize-list must tell so far as may be of the merits of the other sheep.

Messrs. Duckering's best pig at Birmingham was now no higher than the reserve number, Lord Aylesford winning the Cup, with what the judges considered a wonderfully good one of what is called "the Packington improved sort." The best of the pens, Mr. Benjafield's Dorsets, were also highly spoken of; but in one class there was no competition from the pens being imperfect, in another the White Windsors, also from a death, were but badly matched. Mr. Duckering's pen of whites were still very hard to meet or beat; and Mr. John Coote's pen would have won the cup as the best with the other Dorsets out of the way.

Of the two best animals of all we wrote thus in our report of the Birmingham Show:—"The three prize Devon heifers were all good, the first and second especially so, although at breeding shows Daisy has beaten the Royal Adelaide before now. Still the pick of the three was unquestionably Perfection, who, but for her falling away a little in her quarters, went far to realize her title. She has lots of style, a sweet head, a long, straight, well-covered frame, with a good touch, and heavy accordingly is the wagering that she will be first, and first both in Birmingham and in London. But still she was not the best of all the Devons, nor even of the Devon cows and heifers, and perhaps Lady 2nd might fairly compete with her. Again, "At the Oakham show in 1869, Mr. Pulver, a yeoman of Broughton, near Kettering, showed a Shorthorn steer, by Biddenham, a bull from Mr. Charles Howard's Spencer tribe, but bred by Sir W. de Brooke, that took a second prize in an All-England class to Mr. Roland Wood's Little Wonder, the best beast in the show. Young Biddenham then came on to the Smithfield Club Meeting, where in the certainly 'crack' class he was only highly commended. Lord Aylesford's steer, the best animal of his year, being first, Mr. Wood's Little Wonder second, and a steer of Lord Penrhyn's third. Still one of the judges said, 'if kept on for another year, this very stylish steer will be sure to command a foremost place.' Mr. Pulver thence travelled his beast on to Leeds, where he won in his class, but never was in it when the judges came to find the best animal in the yard. During the past summer and autumn he took invariably first prizes for fat stock at Peterborough, Royston, Hinckley, and Wellingborough; as at Oakham in the early part of last week he was not only the first of his class, but the best beast in the show. He had thus 'run through' many of the animals he met in his own class at Birmingham. It will be so gathered that if there were any great merit in Mr. Pulver's ox, he could have no difficulty in his path so far. And he has indisputably great merit in many ways. He is a smart rich roan in colour; he is a compact square rather than an overwhelming animal; he has fed so well that his flesh does not seem to enumber him as it does many a fat beast, but he has a cheerful look and gay carriage, as it is not until you see him out that he moves after a somewhat awkward ungainly fashion. He has an especially good forchard, is well ribbed up, and straight and square in his outline, but bad in his pnrse, having suffered terribly from castration, and standing rather weak from behind. Of course he was not only at a glance the best of his class, being ordered in very early, but as easily the best of his breed; and although Mr. George Turner held out afterwards, the other judges and the lookers on only smiled, as the pretensions of Mr. Smith's Devon when put in comparison with the Shire Shorthorn made it something like a horse to a hen. How-

ever, Mr. Turner did his duty to his county as he did when it came to the best of all, and, as everybody else had seen long previously, the Shorthorn eventually took every prize there was to be taken.

DURING THE WEEK.

There are this year in the classes proper thirty-three entries of Devons, forty-four entries of Herefords, forty-five entries of Shorthorns, twenty-four entries of Sussex, twenty-seven entries of Scotch cattle, and twenty-one entries of Cross-bred stock. The other breeds, such as the Eastern County Polls, the Longhorns, the Irish and Welsh beasts offer, each and all, so poor a front that they are either individually or collectively entitled to little consideration on the appointments of the judges, who are selected in this wise:—To act over the Devons, Herefords, Sussex, red Polls, and Longhorns, the Council constitute a Bench to include one judge known to be a Devon fancier, another a white-faced man, and the third altogether of Sussex proclivities, and this arrangement no doubt is right and fair enough. Whereas to estimate the merits of the Shorthorns, the Scotch Polls, the Highlanders, the Irish, the Welsh, and the Crosses the three judges are elected on the understanding that they must be all Shorthorn breeders. But why should this be so? And the answer no doubt would be that it always has been so, although that of course is no answer, or at any rate no reason whatever. At Islington the numerical strength of the Shorthorns only exceeds that of another breed by a single entry, whereas in point of actual merit or quality, it is far below some of the other kinds of cattle. Nevertheless three Shorthorn worthies still take their places, while the claims of two or three of the very best kinds of fat beasts ever seen at a Christmas show are coolly ignored. These are of course the black Polls, the Highlanders, and the Crosses, as it must be further borne in mind that the most successful cross for the butcher and the best paying one for the feeder is that with a herd of Aberdeenshires. The entries of Shorthorns reached in all to forty-five, and of Scotch cattle and Crosses to forty-eight. It thus becomes sufficiently manifest that if the Sussex, for instance, have now a title to a judge of their own a great injustice is done to such exhibitors as pay us the compliment and add so much "mark" to the meeting by sending their stock from over the Border. Let the Shorthorns still have a majority if it so please the Council, but let us by another year have some one at least whose taste has been educated amongst the Scots to act with them. We say thus much because, either at Birmingham or Islington, as it struck us, the Scotch beasts had scarcely due weight accorded to their merits. Enthusiastic Mr. Turner, or more careful Mr. Pope, would be either very ready champions of the Devons, as men like Mr. Aylmer or Mr. Topham would know how to make the most of a Shorthorn, whenever they happened to get a good one before them. Then the Herefords can always reckon on an able advocate, and Mr. Cane is by no manner of means a gentleman inclined to give way should he find one of his smart Sussex steers favour the hand and fill the eye. When, however, Mr. Heath Harris' beautiful black polled ox was led out to do battle against the world who was there to take up his cause? The three Shorthorn men would naturally rely on what they found in the extra stock when there was nothing extraordinary in their rank and file. Mr. Pope had two or three really superior Devons at his command, and Mr. Cane with nothing particular from his own county would naturally soon come to this way of thinking. Last year, no doubt, the best beast either in the Midlands or the Metropolis was a Scotch Cross, but he was put out for a Shorthorn; and

this season it is still by no means so clear but that the best ox was the Scotch Poll. Although not the heaviest, and not so over-fed as to be unsightly, this beast has plenty of meat and weight, with famous quality, and a certain high-bred style that was really quite charming to a connoisseur. Of course he has been winning again and again all over his own country; and when, what with his gay carriage, they came once more to put him into comparison with the now somewhat "seedy" steer from the Shires it seemed to be anything but a certainty that the Birmingham best would be confirmed at Islington. But bless you! the Shorthorn judges were looking at the Shorthorns, the Devon judges were looking at the Devons, and so the Scotchman had to be content with beating his own breed. To still further prove the necessity for placing a North Briton on the Bench let us look at the decision over the polled cows, where Mr. McCombie's sweet heifer was put second to a plainer, coarser, and even less weighty animal! At Birmingham the award was the other way, and it is next to impossible to understand how its reversal could have been arrived at.

At the dinner of the Hurstpierpoint Show on Thursday last, Mr. Cane said "he had been a breeder of Sussex stock for thirty years, and he still remained firm to the opinion he had formed a long time ago, that the Sussex was superior in many respects to most other breeds. He had been a judge in London this year, and what he had seen there tended to confirm his previous opinion that stock might be classed—Devons first, Sussex second, Herefords third, and Shorthorns fourth. He believed that each of the first three breeds were constantly improving, but Shorthorns were decidedly going back. The way they got to the top of the tree was this, noblemen and gentlemen—who were perhaps better judges of good meat than poor simple people—at one time fancied Shorthorns; but as an humble individual he knew what good things were, and could tell them that Shorthorns as compared with Devons and Sussex, showed as much inferiority as a Kent sheep would against a beautiful Southdown. He very much regretted that the £100 prize at Smithfield had been awarded to a Shorthorn. The judges, who had just awarded two £40 cups, met to consider whether the great prize should be given to a Shorthorn or a Devon. Three of the judges were strongly in favour of the Shorthorn, but he was equally strong in favour of the Devon. The three stuck to it that the Shorthorn should have the prize, and unfortunately one of his (Mr. Cane's) party gave way, and they knew the result. He could only say that he was disgusted, because the Devon was the most handsome beast he had ever seen, worth 1s. a stone more than some of the others. There was also some splendid Sussex stock at Smithfield, and it was his firm opinion that if the gentlemen of the county of Sussex, and many others, would continue to breed Sussex animals as they did now, and to improve them, they would knock all Shorthorns out of the field." Precisely so; and this speech, as we take it, proves our case. A Shorthorn was pronounced to be the best beast in the Show, because there were *three* Shorthorn judges; the Devons stood next, because there were *two* Devon judges, or, at least, one Devon man and his first cousin from Sussex. The one Hereford judge, no doubt, was the first to give way in favour of the Shorthorn, and, as we must maintain, about the very best beast of the year was drafted out, simply because there was no Scotch breeder in office. Under any circumstances, the retention of three Shorthorn judges is, on the face of it, a monstrous injustice to the other established breeds.

But of all the eccentricities in the way of judging stock there has certainly of late been nothing to compare with the awards over the Devons at Birmingham. It is only

charitable to assume that his two colleagues permitted Mr. George Turner to have it very much his own way with this breed, as of course the outside world would hold the Devon man mainly responsible for the Devon awards. When they had the four winners of the classes out to select the best of all the Devons, and when they did select Mr. Smith's steer our comment to the steward who gave us the result was "why, it was a hundred to one on the heifer." As our readers are aware we said as much in our report; nevertheless, *The Times* called him "a superb steer," said that the best Devon cow was "a model," but could not find a word of special compliment for Mr. Senior's heifer. And here in London the superb steer and the model cow took no prizes whatever; while Perfection, who as we had said went far to realise her title, now closed up in place of the steer, with Mr. Pulver's ox as the best of all. There was a vast deal of idle talk, moreover, about the whole class of Devon oxen at Birmingham, which was totally eclipsed by the entry in London. In fact, the first prizes of the oxen and steer classes are all fresh animals, and the best of them a wonderfully good beast in a wonderfully good class. This is Mr. William Taylor's four years and a half old ox, which eventually proved to be the second best beast in the yard. Although fed in Sussex, he is a pure North Devon, having been bred by Mr. Stranger in the Molton country; and he is indeed all quality, famously ribbed, long and deep on a short leg, thoroughly furnished, and set off by a good but not delicate red coat. Mr. McNiven's second here, another fresh beast, was very plain by comparison, and Mr. Aldworth's third took no prize whatever at Birmingham. And after that the deluge! or in other words unnoticed beyond the general compliment of the class, came "the superb steer" that some people went into ecstasies about at Birmingham. Of the Devon heifers we have already written fully, and the Devon Cows, now headed by Mr. Ford, with one of Mr. Mogridge's blood, were still of not much mark; Mr. M'Niven, putting another in place of the Birmingham cow, here in Extra Stock, and the two others taking the same comparative rank of each other as in the previous week. The two-year old Devon steers made up the best class of young beasts in the show, where the Stowey herd managed to make some mark; but luck has lately been against Mr. Farthing, for, as we reported from Birmingham, he had just lost a fat cow, and since then his ox. But the best cow or heifer, Perfection, is of his blood—by young Sir Peregrine out of a cow in the late Mr. Gibbs' herd at Tatham, and so all over "one of those Somerset Devons."

Although the Herefords this season made no stand for the highest honours there is no doubt but that the best filled class in the Hall was that of the Hereford oxen or steers over three years and three months—a really grand entry of great, weighty, noble beasts, just set off by one or two not *quite* equal to his company, or the class must have received a still higher commendation. The best, again like the best Devon fed in Sussex, was bred by Mr. Myddleton in Shropshire, as a credit to the county; for he is a magnificent specimen of the breed, deep, massive, and bloodlike, but positively disfigured by the frightful condition into which his feet have been suffered to grow. It looked, in fact, like cruelty to order him out, as it is a case which might repay going into, say by Lord Powis, or Miss Burdett Coutts. To show the general strength of this class, Mr. Philip Turner's smart steer, the best of the old class at Birmingham, took nothing more than a high commendation, being fairly beaten on his merits; while Mr. Bettridge's third prize in the Midlands was now unnoticed. On the opening day in Bingley Hall the third prize was placarded over the head of Her Majesty's parti-coloured beast, but this was an error of the stewards and not of

the judges. Neither of the classes of younger Hereford steers at Islington would rank with the oxen, particularly if we took, as we assume we must, Lord Darnley's beast as the best of them, for this is a cowy-headed, delicate looking animal, awkward out, and by no means so true, when you come to examine him in his stall; but the award in his favour seemed to be a mistake. The Hereford cows and heifers were mainly the Birmingham entries over again, and of these we have said sufficient already.

With one very noticeable exception all the top-prize Shorthorns at Birmingham were also at the head of their classes in London, and a very moderate lot, as we have already intimated, they were. To certain transpositions which the Smithfield prize-list shows, we have already spoken, and as it is but tedious work re-writing our impressions we may take the gist of our previous reports. With Mr. Pulver's ox now well out of the way, Mr. Joseph Stratton's "clever, deep, and square steer, unquestionably the next best," now succeeded to the first place; Mr. Richard Stratton's third-prize here, and a winner at Chippenham, having been entered but not sent to Birmingham; while Messrs. Martin's high-quality ox still kept his place as next to the Wiltshire white. Amongst the middle-aged steers Mr. Searson's very good white, first at Oakham and second at Birmingham was once more first in a very so-so company; Lord Aylesford's short podgy steer, with his unpardonable forehead, winning again amongst the youngsters, as he could, should, or would not have done, with anything like creditable competition. The London judges reversed the Birmingham, awards over the first and second Shorthorn cows, and perhaps it was always "a toss-up for choice" between the two; but we cannot understand how Mr. Hunter's terribly plain heifer now came to be preferred to the other Scotch lassie, "so straight, deep, and handsome," which, had the Shorthorn man only held to his own line as he should have done, would, with the Devon heifer put early out of it, have been the best of all the cows and heifers at Birmingham. Still they were both fairly beaten by Mr. Richard Stratton's Peeress, first at Taunton and third prize at the Royal Oxford last summer, and a really grand lengthy heifer, but always exhibited in very high condition. As a consequence she has not bred, although thought to be in calf until lately, while she has also been down with the foot-and-mouth disease, so that she was not so ripe nor so blooming as she might have been, or she must have run the Devon very closely as the best of her sex. Peeress, however, is not destined for the shambles, as she goes back further west into Cornwall, where Sir Frederick Williams has purchased her at butcher's price by way of an experiment. Mr. Senior also keeps on Perfection for another year, not with the hope of breeding from her, but with an eye to another trial for the Champion Plate—a very hopeless business as it looks. We write without the records before us, but did a cow or heifer ever take the crowning honours as the best beast of all at Birmingham? If our memory serve us, something from the Towneley stalls did *once* achieve this feat.

Mr. Cane notwithstanding, the Sussex oxen were certainly not so good as we have seen them; but some of the ladies, like Mr. Lee Steere's heifer were as handsome and bloodlike as Devons, although on a larger scale. There were in all three Norfolk and Suffolk red Polls entered, of which was a *roan*, and the sort should merge again one into the other breeds. There were two Longhorns in two classes, and these again have no longer a right to any rank of their own; there were two Irish, one of which had no merit, and three Welsh beasts, where in one class any prize was also withheld, and as none of these breeds ever do come in any numbers it is a simple absurdity keeping skeleton classes open on their behalf. Let them try conclusions against each other as Other Breeds. The

same course might be at once adopted with the new class of other Scotch-horns, of which there were three entries in one class and none in the other; while two of these were wretched things, and the best of them, so far as anybody could understand, of "no breed in particular." It was, in fact, a farce to put such animals in a line with the capital lot of true West Highlanders, over the dozen of which the judges duly distributed the two premiums and five commendations; but then as they carefully took no notice whatever of Lord Southesk's handsome ox, the second, as he should have been the first at Birmingham, it is doubtful whether they knew even as much of the Highlanders as their fellows at Birmingham, and that was no vast deal. To the merits and placing of the black Polled we have already spoken, and still the conclusion we come to is that by another year there must be at least one Scotch judge in office. What particular recommendation can three Shorthorn breeders, or a Devon-Hereford-and-Sussex trio have for such a duty?

Again, the nine prizes for cross or mixed-bred beasts were all won by Scotchmen, as the good class of oxen was thought to be but badly judged. Of course these were all by a Shorthorn bull on to an Aberdeen cow, proverbially the best cross out, but then the people who breed them must necessarily know the most about them, and should, directly or indirectly, have some voice in determining their merits. Messrs. Martin's best cross-bred ox at Birmingham, a beast we never quite fancied, was now only fourth; but there could be no mistake about the placing of Lord Dunmore's capital heifer, which in some years or under some circumstances might have fairly aspired to something more. There were other crosses of the Shorthorn-and-Hereford, the Devon-and-Sussex, the Devon-and-Shorthorn, and the Hereford-and-Poll, but none of these can compare with the long-famous Shorthorn-and-black Poll—a veritable "nick." The Broughton steer was the hero of the extra stock; where a cross-bred heifer beat the best of all the cows at Birmingham, and her Majesty's best cow in extra stock at Birmingham, who here ran a dead heat for second. This plan of changing the judges looks to be a very wholesome proceeding, or the "superb steer" and the "perfect cow" might have taken the same imposing places in London as they did in the Midlands. With a reported outbreak of foot-and-mouth disease in the show on the last day, Mr. Pulver's ox cannot go on to Leeds, and this is to be regretted, as there would have been some chance of the Yorkshiremen closing with him.

At the general meeting of the members of the Smithfield Club, on Tuesday, Mr. Sewell Read said: "He thought it undesirable that a great national Club like this should encourage a weight that was not required. The light weight of a Southdown he could understand; but the light weight of a Cross-bred, if it were of good quality, was something that he could not understand. Even with the Southdowns, when he saw that Lord Walsingham could bring them out at one year almost as heavy as if they were two years old, it seemed to him that the days of light weight for Southdowns were nearly at an end. But with regard to Cross-bred sheep, which he looked on as the sheep for the million, he contended that the bigger and better they were the more advantageous would it be alike for the farmer and the consumer. He hoped then that the prizes for Cross-bred sheep would not be reduced, but rather let them add to the number of prizes for yearling sheep. It was the most important class in the yard; and if it were possible to subdivide it by allowing the Cross-bred Mountain sheep to appear in another class he should not object, but he urged on the Council the desirability of striking out such an unnecessary class as that to which he had called attention." This, however,

is now quite an old story. In the Club report of last year one of the Shortwool judges writes thus: "Of this light weight class, I may say I have often wondered whether it was a necessary one. I think it has never happened that the gold medal or silver cup has been taken by it; and a grand pen of sheep of Sir William Throckmorton's was struck out, because one of the best sheep was 2 lbs. above weight. Are either the exhibitors or the public benefited by this class?" And another of the judges over the same class says that the light weight condition has failed to effect its object; while he adds that some years ago "Mr. Henry Upton carried off the Gold Medal with a pen of light-weight sheep." Nothing of course is easier than to obtain mere size and weight at a sacrifice of breed, and so let cross-bred sheep, honestly entered as such, be made as heavy as the feeder pleases. But for many years past, long before the supremacy of the Merton flock was established, there had been something more than a suspicion that the purity of the Southdown had been tampered with in order to reach great growth. A bit of Hampshire or black-faced Sussex has occasionally been introduced, and the sheep were, in fact, no longer thorough-bred. At this very show the only whole class of sheep which was highly commended was that of the light-weight Southdowns, and deservedly enough too, for there was more bloodlike true character here than in any other section. The pens also took a deal more judging, and Lord Walsingham was at length as nearly as possible beaten; many, indeed, still preferring Sir William Throckmorton's pen. Whereas in the other class of young wethers, without conditions as to weight, the Merton sheep, pronounced to be the best pen in the Show, are actually heavier than the prize Shropshires of precisely the same age! They are grand sheep certainly for the butcher, but if they go on increasing in bulk as of late, it is hard to realize what a Southdown will eventually come to. The Duke of Richmond's old sheep are particularly stylish, as a long way ahead of their small and moderate class; while Lord Walsingham's seven-year-old ewes have worn wonderfully well after so much good service in the flock. Lord Sondes, as he generally does, showed some remarkably neat clever Downs; but Mr. Rigden was not up to his usual form, the Hove pens looking light and leggy, however good in their tops.

The older hands at this business did not quite like it when Lord Chesham beat them all for Shropshires at Manchester, nor will they now take very kindly to the proof, as afforded by the scales. Still, as we said at Birmingham, the Latimer flock is reaching fast to the standard of an "Improved Shropshire," and with fresh sheep and fresh judges his Lordship was first in the three classes, as Mr. Horley must know what a Shropshire should be. Mrs. Beach's sheep, of something the same type, are also very good to show, as they always have been of late; but some of the other exhibitors in these classes have certainly sent up better samples from their flocks. Mr. Morrison's and Messrs. Russell's West Country Downs are more comely to look on than the good old-fashioned sour-headed sort, but some how or other we never now meet with such smart, high-quality Hampshires or Wiltshires as that stalwart steward, who has just passed along-side, was wont to exhibit. There was no class in the show which more honestly won its commendation than the capital entry of Oxfords, where Sir Henry Dashwood for the first time at a great meeting took the top place with the heaviest pen in the class; and really grand commanding sheep they are, of good looks, with famous backs, and perhaps at all points the best lot of fat sheep of this kind ever brought out. But then what are

the points, or who will be kind enough to draw up a scale of points for judging an Oxfordshire Down? There are only two pens of fat ewes exhibited, both very excellent, but as different from each other as it is possible to imagine any sheep to be that are entered as of the same breed. Mr. Treadwell's are big, useful, roughish looking ewes, and Mr. Charles Howard's very neat, full of quality, and with sweet blood-like heads; two of the three, in fact, being at nearly five years old from the Bury Royal prize pen; while Mr. Alfred Rogers secures his now recognised annuity from the same flock. There was a mixed class of Cheviots, Ryelands, and Somersets, where the Cheviots were but poorly represented; while the Duke of Roxburgh's black-faced Highlanders were really good, as their quality of mutton will compare well with the West Highlander's beef, that is amongst the primeest a butcher can buy or sell. As at Birmingham, the crosses did not look to contain anything of remarkable excellence, but nevertheless Mr. John Overman took the Cup for the best of the other breeds or cross-breeds, though the superiority of the short-and-long-wool pen to Sir Henry Dashwood's Oxfords was not so apparent. They were fairly beaten for weight, which Mr. Sewell Read would have us take as the best test of a cross-bred. "The Royalists" laughed outright when they saw the Romney Marsh sheep at Canterbury, but there was really a very creditable entry this year at Islington, and the improvement since they left the Ark seems at length to have been set about in earnest. In the small show of Lincolns the Birmingham award was very properly corrected in favour of Mr. Lister, who beat Mr. Harris alike for weight, style, and quality, Mr. Pears retaining his third place with one of the heaviest pens at their age in the Hall. There were four entries of Cotswolds and four prizes awarded, the most that can be said for them, as if the breeders do not care to make a show they should undoubtedly merge into the other breeds. Indifference should be met with indifference, as retaining classes that do not fill must have a bad effect. Still, it is only fair to say that the new class of three fat ewes was in every direction a failure, for no where did the competition exceed three entries, as more frequently there was but one pen exhibited for the prize. Lord Berners' Leicesters are as usual very carefully fed and very finely bred. It is said that they never sell nor let a ram from Keythorpe, but keep some of their best lambs for wethers, so that a lead in this way must be maintained alike at some cost to the flock and the public; as on such conditions a farmer has of course no chance of engaging in successful rivalry.

A successful breeder and acknowledged judge of pigs has favoured us with some notes, of which we avail ourselves in preference to dwelling on our own experiences of that dreadful black hole, a very concatenation of abominable effluvia. A less interesting show of pigs has not been seen at Smithfield for years; few in number, and nothing great in size or quality. This section of the show seems quite at a standstill, if not actually drifting back. Many old names are missed from the list of exhibitors, and new ones are not forthcoming. There are thirty-seven entries for nine classes, and the best filled class not good enough to merit a second prize, although containing Mr. Baily's first prize Birmingham Berkshires, made up of very good pigs if not quite up to the mark for a fat show. But they certainly should not have been passed over. Capt. Warren's prize pen of whites took our fancy much; but in the succeeding class of the same colour, no prize was awarded, some of the pigs having died in the Hall. In the class of older white pigs Sir A. Rothschild showed a wretched pen, the Duckering's being a long way first; while Capt. Warren's lot were wonderfully fat, but had lost form, or they would have put Mr. Lynn out of it.

Amongst the black pigs the Dorsets had it all to themselves, Mr. Coate and Mr. Benjafield the two firsts, with Mr. Robertson and Mr. McNiven to follow. Some fancied Mr. McNiven's entry for second in each class, but there was really not a £20 cup pen in the yard. In the three remaining classes the Berkshire took all the prizes; Mr. Biggs being first and second, with some excellent pigs, Mr. Samuel Druce and the Marquis of Ailesbury the other firsts, and Mr. King, with a pen of coarse animals, second in his class. The single extra stock pigs aided the show wonderfully, and in a really good competition the Earl of Aylesford took the cup, beating the best pig at Birmingham, for which Messrs. Duckering have at length found a breeder's name in Mr. Cornish. The subjoined suggestions may be worth the attention of the Council. Have only two classes, under and over six months old, in each breed: large whites, small whites, small blacks, and Berkshires. Let the *under six months* be shown in pens of *five* and for *breeding* purposes; over six months, as *fat* stock. Give two £10 cups, one to the best pen for breeding purposes, and one for the best fat pigs, instead of as now, one £20 cup. The object of breeders in showing is to *sell* their stock. They do not care to compete in the fat classes. This is proved by the fact of there being only twenty-five exhibitors for the eighteen prizes in the nine classes for *breeds*. Do not put the pigs in the cellar with such narrow passages between the rows of pens, and do not use so much carbolic acid as to make the place stink worse than any *respectable pig sty*. Give up one side of the main Hall, under the gallery, and let some of the implements go into the cellar; or hold the root show there. Further, why should not the weight of a pig be given as well as that of a sheep or an ox? There could surely be little trouble in arriving at this information with a lot of over-fed or over-dosed animals.

Fat Wethers, 1 year old (under 28 months).

First prize of £20, Lord Berners, Keythorpe Hall, Leicester—6 cwt. 3 qrs. 21 lbs.

Second of £15, W. Brown, Holme-on-Spalding, York—6 cwt. 1 qr. 21 lbs.

Third of £5, J. Newman, Harrowden, Bedford—6 cwt. 3 qrs. 23 lbs.

Commended.—Colonel Lowther, M.P., Barleythorpe—5 cwt. 8 qrs. 35 lbs.

Fat Wethers, 1 year old (under 28 months).

Each Sheep not to exceed 220 lbs. live weight.

First prize of £20, Lord Berners, Keythorpe Hall, Leicester—5 cwt. 2 qrs. 11 lbs.

Second of £15, W. Brown, Holme-on-Spalding, York—5 cwt. 2 qrs. 11 lbs.

Third of £5, F. J. S. Foljambe, M.P., Worksop, Nottingham—5 cwt. 2 qrs. 15 lbs.

Fat Ewes, above 3 years old (that must have had a Lamb).

The prize of £10, Colonel Lowther, M.P.—5 cwt. 3 qrs. 7 lbs.

COTSWOLDS.

Fat Wethers, 1 year old (under 28 months).

First prize of £20, R. Hall, Great Barford, Oxford—8 cwt. 25 lbs.

Second of £15, J. Wheeler, Long Compton, Warwick—7 cwt. 1 qr. 3 lbs.

Third of £5, J. Baldwin, Luddington, Warwick—7 cwt. 6 lbs.

Fat Ewes, above 3 years old (that must have had a Lamb).

The prize of £10, J. Baldwin, Luddington, Warwick—6 cwt. 1 qr. 26 lbs.

LINCOLNS.

Fat Wethers, 1 year old (under 28 months).

First prize of £20, C. Lister, Coleby Lodge, Lincoln—7 cwt. 2 qrs. 11 lbs.

Second of £15, J. B. Swallow, Barton-on-Humber—7 cwt. 2 qrs. 25 lbs.

Third of £5, J. Pears, Mere Branston, Lincoln—8 cwt. 9 lbs.

Highly commended.—T. W. D. Harris, Wootton, Northampton—6 cwt. 3 qrs. 12 lbs.

Commended.—J. Byron, Sleaford—7 cwt. 3 qrs. 16 lbs.; and T. Gunnell, Milton, Cambridge—7 cwt. 3 qrs. 21 lbs.

Fat Ewes, above 3 years old (that must have had a Lamb).

The prize of £10, F. Sardeson, Cranwell, Sleaford—9 cwt. 2 qrs. 5 lbs.

Highly commended.—J. Pears, Mere Branston, Lincoln—8 cwt. 1 qr. 26 lbs.

KENTISH OR ROMNEY MARSH.

Fat Wethers, 1 year old (under 28 months).

First prize of £15, J. Newport, Ashford, Kent—6 cwt. 3 qrs. 4 lbs.

Second of £10, F. Murton, Smeeth, Kent—6 cwt. 3 qrs. 4 lbs.

CROSS-BRED LONG-WOOLLED.

Fat Wethers, 1 year old (under 28 months).

First prize of £15, T. W. D. Harris, Wootton, Northampton—7 cwt. 3 qrs. 6 lbs.

Second of £10, Sir W. DeCapell Brooke, Bart., Kettering, Northampton—6 cwt. 3 qrs. 16 lbs.

Highly Commended.—J. Newman, Harrowden, Bedford—6 cwt. 3 qrs. 22 lbs.

SOUTHDOWNS.

Fat Wethers, 1 year old (under 28 months).

First prize of £20, Lord Walsingham, Thetford—6 cwt. 2 qrs.

Second of £10, F. J. S. Foljambe, M.P., Worksop—6 cwt. 5 lbs.

Third of £5, Duke of Richmond, Goodwood—5 cwt. 2 qrs. 21 lbs.

Highly commended.—H. Humphrey, Ashington, Sussex—6 cwt. 1 qr. 24 lbs.

Fat Wethers, 1 year old (under 28 months).

Each Sheep not to exceed 200 lbs. live weight.

First prize of £15, Lord Walsingham, Merton Hall, Thetford—5 cwt. 23 lbs.

Second of £10, Sir W. Throckmorton, Bart., Buckland, Berks—5 cwt. 12 lbs.

Third of £5, Lord Sondes, Elmham Hall, Thetford—5 cwt. 9 lbs.

Highly commended.—The Duke of Richmond, Goodwood, Sussex—5 cwt. 12 lbs.; and the class generally.

Fat Wethers, 2 years old (above 23 and under 35 months).

First prize of £15, Duke of Richmond, Goodwood—6 cwt. 2 qrs. 9 lbs.

Second of £10, J. Overman, Burnham Sutton—6 cwt. 3 qrs. 24 lbs.

Commended.—W. Taylor, Glynley—6 cwt. 8 lbs.

Fat Ewes, 8 years old (that must have had a Lamb).

The prize of £10, Lord Walsingham, Merton Hall, Thetford—5 cwt. 2 qrs. 2 lbs.

Highly commended.—Lord Dacre, Kimpton, Herts—6 cwt. 22 lbs.

HAMPSHIRE OR WILTSHIRE-DOWNS.

Fat Wethers, 1 year old (under 23 months).

First prize of £20, A. Morrison, Tisbury, Wilts—7 cwt. 1 qr. 2 lbs.

Second of £15, J. Russell, Sutton-at-Hone, Kent—7 cwt. 17 lbs.

Third of £5, R. and J. Russell, Horton Kirby, Kent—7 cwt. 2 qrs. 8 lbs.

Highly commended.—J. and M. Arnold, Westmeon, Hants—6 cwt. 3 qrs. 26 lbs.

Commended.—W. G. Duncan, Bradwell, Bucks—7 cwt. 1 qr. 10 lbs.

Fat Ewes, above 3 years old (that must have had a Lamb)

The prize of £10, J. D. Allen, Tisbury, Wilts—6 cwt. 4 lbs.

SHROPSHIRE.

Fat Wethers, 1 year old (under 23 months).

First prize of £20, Lord Chesham, Latimer, Bucks—6 cwt. 14 lbs.

Second of £10, T. Nock, Sutton Maddock—6 cwt. 1 qr. 11 lbs.

Third of £5, Lord Wenlock, Eacrick Park, York—6 cwt. 1 qr. 20 lbs.

Highly commended.—S. C. Pilgrim, Burbage, Hinckley—7 cwt. 10 lbs.

Fat Wethers, 2 years old (above 23 and under 35 months),

First prize of £15, Lord Chesham, Latimer, Bucks—7 cwt. 2 qrs. 22 lbs.

Second of £5, Sarah Beach, Brewood, Penkridge, Stafford—8 cwt. 26 lbs.

Highly commended.—J. Coxon, Lichfield, Stafford—7 cwt. 2 qrs. 22 lbs.

Fat Ewes above three years old (that must have had a Lamb).

The prize of £10, Lord Chesham, Latimer, Bucks—7 cwt. 10 lbs.

Very highly commended.—T. Nock, Sutton Maddock Shiffnal—6 cwt. 3 qrs. 20 lbs.

OXFORDSHIRES.

Fat Wethers, 1 year old (under 23 months).

First prize of £20, Sir H. W. Dashwood, Bart., Kertington Park, Oxford—7 cwt. 3 qrs. 27 lbs.

Second of £15, the Duke of Marlborough, Blenheim, Woodstock—7 cwt. 1 qr. 18 lbs.

Third, of £5, N. Stilgoe, Adderbury, Oxford—7 cwt. 2 qrs. 24 lbs.

Highly commended.—Lieut.-Col. Loyd Lindsay, V.C., M.P., Wantage, Berks—7 cwt. 2 qrs.

The class generally commended.

Fat Wethers, 2 years old (above 23 and under 35 months).

The prize of £10, A. Rogers, Bromham Bedford—8 cwt. 7 lb.

Fat Ewes, above 3 years old (that must have had a Lamb).

The prize of £10, J. Treadwell, Upper Winchendon, Bucks—8 cwt. 1 qr. 26 lb.

Highly commended.—C. Howard, Biddenham, Bedford—7 cwt. 3 qrs. 15 lbs.

RYELANDS, CHEVIOTS, AND DORSETS.

Fat Wethers.

First prize of £15, H. Farthing, Nether Stowey, Somerset—6 cwt. 3 qrs. 14 lbs.

Second of £10, J. B. Downing, Holme Lacey, Hereford—6 cwt. 2 qrs. 5 lbs.

Third of £5, Sir W. Gordon Cumming, Bart., Altyre Forres, Moray—6 cwt. 1 qr. 14 lbs.

Highly commended.—R. Jardine, M.P., Castlemilk, Lockerbie, Dumfries—4 cwt. 3 qrs. 17 lbs.

MOUNTAIN-BREEDS.

Fat Wethers, of any White-faced Mountain breed, of any age.

First prize of £15, J. Tapp, Twitchen, Devon—5 cwt. 1 qr. 10 lbs.

Second of £10, W. Smith, Hoopern, Exeter—4 cwt. 2 qrs. 14 lbs.

Highly commended.—C. McNiven, Perrysfield, Surrey—4 cwt. 8 lbs.

Fat Wethers, of any Black-faced or Speckled-faced Mountain breed, of any age.

First prize of £15, The Duke of Roxburghe, Floors Castle, Kelso—5 cwt. 3 qrs. 23 lbs.

Second of £10, The Earl of Strathmore, Glamis Castle, Forfar, N.B.—5 cwt. 3 qrs. 20 lbs.

Highly commended.—J. McGill, Rotchell, Dumfries—5 cwt. 1 qr. 1 lb.

CROSS-BRED LONG AND SHORT-WOOLLED.

Fat Wethers, 1 year old (under 23 months).

First prize of £20, J. Overman, Burnham Sutton, Suffolk—6 cwt. 3 qrs. 23 lbs.

Second of £15, H. Purser, Willington Manor, Bedford—7 cwt. 2 qrs. 26 lbs.

Third of £5, J. Newman, Harrowden, Bedford—7 cwt. 3 qrs. 8 lbs.

Highly commended.—T. Rush, Babraham, Cambridge—7 cwt. 3 qrs. 17 lbs.

Commended.—Z. W. Stigloe, Adderbury, Oxford—7 cwt. 1 qr. 25 lbs.; and J. Mason, Eynaham, Witney, Oxfordshire—7 cwt. 2 qrs. 18 lbs.

Fat Wethers, 1 year old (under 23 months).

Each Sheep not to exceed 220 lbs. live weight.

First prize of £10, J. Overman, Burnham Sutton, Suffolk—5 cwt. 2 qrs. 14 lbs.

Second of £5.—No other entry.

PIGS.

WHITE.

Not exceeding 9 months old.

First prize of £10, Capt. R. P. Warren, Basingstoke.

Second of £5, Her Majesty the Queen, Windsor.

Above 9 and not exceeding 12 months old.

Insufficient merit.

Above 12 and not exceeding 18 months old.

First prize of £10, R. E. Duckering and Son, Northorpe, Kirton Lindsey.

Second of £5, J. Lynn, Stroxtan, Grantham.

Highly commended.—Captain R. P. Warren.

BLACK;

Not exceeding 9 months old.

First prize of £10, J. Roberson, Bayfordbury, Herts.

Second of £5, J. Coate, Hammoon, Blandford, Dorset.

Above 9 and not exceeding 12 months old.

First prize of £10, A. Benjafield, Stalbridge, Blandford.

Second of £5, C. McNiven, Perrysfield, Surrey.

Above 12 and not exceeding 18 months old.

First prize of £10, J. Coate, Hammoon, Blandford.

Second of £5, Captain R. P. Warren, Basingstoke.

Commended.—C. McNiven, Perrysfield, Surrey.

OTHER BREEDS.

Not exceeding 9 months old.

First prize of £10, J. Biggs, Cublington, Leighton Buzzard.

Second of £5, Withheld.

Above 9 and not exceeding 12 months old.

First prize of £10, S. Druce, Eynsham, Oxford.

Second of £5, J. Biggs, Cublington, Leighton Buzzard.

Above 12 and not exceeding 18 months old.

First prize of £10, The Marquis of Ailesbury, Savernake Forest, Wilts.

Second of £5, J. P. King, North Stoke, Berks.

EXTRA STOCK.

Oxen or Steer, £10 and silver medal.—Thomas Pulver, of Broughton, Kettering—20 cwt. 3 qrs. 14 lbs.

Very highly Commended.—William Heath, of Ludham Hall, Norwich—17 cwt. 2 qrs. 20 lbs.

Highly Commended.—Robert Jardine, M.P., Castle-milk, Lockerbie, N.B.—17 cwt. 2 qrs. 20 lbs.

Commended.—Robert Barcham, Thurgarton, Ilanworth, Norfolk—17 cwt. 3 qrs. 26 lbs.

Heifers or Cows, £10 and silver medal.—E. Walter, Tangley Farm, Wothingham—17 cwt. 2 qrs.

Highly Commended.—C. McNeven, of Perry'sfield Oxsted, Godstone—14 cwt. 17 lb.; The Queen—16 cwt. 8 qrs. 6 lbs.

Commended.—Joseph Perkins, of Laughton, Rugby—16 cwt. 2 qrs. 5 lbs.

Long-wool wether Sheep, silver cup value £5.—John Byron, Kirkby Green, Sleaford—8 cwt. 2 qrs. 20 lb.

Short-wool wether Sheep, silver cup, value £5.—Lord Walsingham—2 cwt. 2 lbs.

Highly Commended.—Duke of Richmond—1 cwt. 3 qrs. 9 lbs.; F. J. S. Foljambe—1 cwt. 3 qrs. 9 lbs.

Commended.—R. and J. Russell, of Horton, Kirby, Dartford, Kent—2 cwt. 3 qrs. 16 lbs.; John Russell, Sutton-at-Home, Dartford—2 cwt. 1 qr. 9 lbs.; H. H. Penfold, Selsey, Chichester—1 cwt. 3 qrs. 6 lbs.; A. Morrison, Fonthill House, Tisbury, Wilts—2 cwt. 2 qrs. 6 lbs.; Sir W. Throckmorton—1 cwt. 3 qrs. 10 lbs.; Lord Braybrooke—1 cwt. 3 qrs. 16 lbs.

Shropshire, Oxfordshire cross-bred or any other breed of wether Sheep, silver cup, value £5.—Joseph Newman, of Harrowden, Bedford—2 cwt. 2 qrs. 16 lbs.

Single Pig.—Silver Cup, value £5, Earl of Aylesford, Packington Hall, Coventry.

Specially commended.—R. E. Duckering and Son, Northorpe, Lincoln.

Highly commended.—J. Lynn, Stroxton, Lincoln.

Commended.—J. Coate, Hammoon, Dorset, and J. and F. Howard, Bedford.

SILVER CUPS.

Best Steer or Ox in any of the Classes.—Silver Cup, value £40, W. Taylor, Glynley, West Ham, Sussex, for Devon Ox—4 years 6 months.

Best Heifer or Cow in any of the Classes.—Silver Cup, value £40, T. L. Senior, Aylesbury, Bucks, for Devon Heifer (Perfection).

Best pen of Leicesters, Cotswolds, Lincolns, Kentish, or other Long-wool Sheep.—Silver Cup, value £20, Lord Berners, for Leicesters.

Best pen of one-year-old Southdowns, Hampshire, or Wiltshire Downs.—Silver Cup, value £20, Lord Walsingham, for Southdowns.

Best pen of one-year-old Shropshire, Oxfordshire, Cross-bred, or any other breed of Sheep.—Silver Cup, value £20, John Overman, for Cross-bred.

Best pen of Pigs in any of the Classes.—Silver Cup, value £20, A. Benjafield, Stalbridge, Blandford, for Dorsets.

CHAMPION PLATE.

The best Beast in the Show (Extra Stock included).—A Piece of Plate, value £100, to T. Pulver, Broughton, Kettering, Northampton, for Shorthorn steer.

The best pen of Sheep in the Show.—A Piece of Plate, value £50, Lord Walsingham, for Southdowns.

THE IMPLEMENTS.

Taken as a whole, the show of engines and implements was an excellent one, affording convincing evidence of the increasing attention now given to every economical and effective means of cultivation by improved machinery. Every agricultural engineer and maker is on the look-out for any innovation or novel application of power to the preparation of the soil, and the culture and harvesting of crops. Notwithstanding the high prices charged for space, there was quite a rush for exhibiting and the only wonder in looking at the catalogue is how the immense number of bulky implements and engines ever got compressed and located in the limited exhibiting space at disposal after the great guns of the show—the live-stock had been accommodated. The wall area of the lower department of the Hall was closely packed with the bulky engines and implements of the leading makers, and to these we shall first direct attention. It may be stated that there were above and below stairs, about 200 stands in all; independent of the usual heterogeneous series of exhibitors in the avenue and concert-hall bazaar, few of whose exhibits had any direct connection with agriculture, however useful the objects might be in a domestic point of view. Thomson's road steamer, which attracted so much attention at the Oxford meeting, has evidently taken firm hold of the public mind, for, besides John Fowler and Co., we have Ransomes' Ipswich firm, and Robey and Co., of Lincoln, going in for their manufacture. Thomson's road steamer and Aveling and Porter's road locomotive are making some noise just now on the other side of the Atlantic, where their special advantages and demerits, as applicable to use in America, are being energetically discussed. Robey and Sons, Limited, of Lincoln, showed one of these steam traction engines, a class of engine adapted for so many practical purposes, being fitted with vertical boilers and wheels covered with Thomson's india-rubber flanges, and which several of the principal engine-makers are now manufacturing under licence. Those who have seen this new system of covering the wheels, are aware that the india-rubber tyres are guarded by an outside band of steel plates 18 inches broad and five inches deep, with intervals of $1\frac{1}{2}$ inches between them. At almost all times there are four of these plates bearing firmly on the ground through the elasticity of the rubber, so that the surface adhering to the roadway is generally $24\frac{1}{2}$ inches by 18 inches, or about $2\frac{1}{2}$ square feet superficial. An engine of the kind, just completed for the war department by this firm, shows a new development in their application to modern military operations. They also exhibited at the show an 8-horse power portable steam engine with patent direct acting governor expansion valve for economising fuel, a 3-horse power vertical engine, and one of their improved angle iron-framed thrashing machines with self-acting feeding apparatus which is light, and easy of transport, strong, and perfectly true and rigid under all circumstances. Wallis and Stevens, of Basingstoke, had some of their horse-power thrashing machines, fitted with patent spherical bearings, which are much in demand in Europe and the Colonies, from their portability. They are also fitted with a riddling apparatus. On their stand were also some winnowing machines, blowers, and corn screens. Richard Garrett and Sons, of Leiston Works, Suffolk, showed a selection of their portable engines, suited to purposes where economical consumption of fuel and water are essential; also a compact fixed steam-engine with horizontal cylinder, samples of boilers, and some of their improved corn and seed and general purpose drills. Richard Hornsby and Sons, of Grantham, had a good collection of turnip-cutters, drills, their "governor"

and "progress" reaping-machines, and other of the well-known implements of their make. They also exhibited new and improved single and double-furrow ploughs. The mechanical arrangements of the double-furrow are of easy adjustment to regulate the depth of furrow, to plough from 7 to 11 inches. By improvements in the manufacture of the parts of wheels, a new boss and a new axle, both cast-chilled, may be had to fit for 16d., thus rendering the farmer independent of accidents, by being able to replace readily essential parts. By doing away with the blades or alipes and the introduction of a frictional-wheel, the plough can be made to act both on the deep furrows as well as on the top of the ridge—a great advantage in strong land. In the single plough the bottom of the wheel is set at right angles with the share and coulter. Barrows and Stewart, of Banbury, brought forward some of their portable steam-engines, thrashing machines, and wrought-iron cattle cribs. Tuxford and Sons, of Boston, had some of their prize portable engines, and thrashing machinery, for which their firm is so well known. J. and F. Howard, of Bedford, exhibited their steam cultivator—a new and simple reaping machine, with wrought-iron wheels, of simple construction, which can be packed or put together easily, to which they have given the name of the International Reaper. They had also some of their new double-furrow ploughs, suited to different lands and various depths of cultivation. These are strong, simple, efficient, and light of draught. The new patent steering has an evident advantage, inasmuch as both the land wheel and furrow wheel are steered by one simple lever. The plough is thereby much more easily guided than when only one wheel is steered, and the turning at land's end is also greatly facilitated: the depth of the land which can be instantly adjusted, and the whole standard being upright and held firmly in a quadrant, little or no strain or vibration takes place; the same lever which effects this, also serves for lifting the plough out of ground at land's end. The patent expanding beam, for altering the width of furrow, has the advantage of being held at both ends by the fixed beam, thereby securing rigidity and durability. John Fowler and Co., of Leeds, had some of their steam cultivating and traction engines. They have also introduced a novelty on the wheels of the steam road-engine, in applying segments of india-rubber unprotected on the exterior of the steel plates, in addition to that which covers the wheel. Whether this will be found to wear well in use remains to be seen. Aveling and Porter, of Rochester, had one of their agricultural locomotives, of which it is said that more than 500 are now in use in Europe. Their utility and manageableness no one will call in question who had the opportunity, as at the Oxford Meeting, of seeing them moving about the Show-yard in all directions, lifting and dropping ponderous loads, under the sole guidance of a lad; they also showed a twenty horse power nominal steam-ploughing engine, a twenty ton steam-road roller, and one of Thomson's india-rubber tyre engine wheels, fitted with Sterne's segments and Aveling and Greig's patented improvements. Murray and Co., of Banff, had some of their double-furrow ploughs, to which we drew attention at the Oxford meeting, and combined convertible super and subsoil ploughs. Underhill, of Newport, also had light, strong, and cheap double-furrow ploughs, and a double-thrashing machine, fitted with elevator and grain cleaner. Mellard's Trent Foundry showed an American revolving mould-board plough, a good pulverizer and useful subsoil plough, some new patent grist mills, and chaff-cutters, and pulpers. Renbon Hunt had a variety of useful implements—such as seed drills, dressing machines, pulpers, and cake-breakers. Lewis and Hook, of Shrews-

bury, exhibited prize ploughs, turnip-cutters, slicers, and pulpers. Priest, Woolnough, and Anchell, of Kingston, had drills, horse hoes, and manure distributors. The Beverley Iron and Waggon Company, Limited, had on their stand some model carts, with harvest shelvings, patent wheels and axles, and liquid manure or water carts, which have always held a high place at the Royal Society's shows, also one of the double self-adjusting or reversible swathe delivery reaping machines, clod crushers, and corn mills. E. R. and F. Turner, of Ipswich, showed one of their four-horse portable steam engines adapted for use on the farm or for any general purpose, with a self-acting cut-off single and double blast thrashing and winnowing machines, rollers and crushing mills, which gained so many honours at Oxford. Holmes and Sons, of Norwich, also had a portable engine, manure-distributors and corn and seed drills. Ransomes, Sims, and Head exhibited some of their well-known portable engines, an eight-horse power single cylinder expansion steam engine, one of Thomson's patent traction engines; many of the various descriptions of ploughs for which this firm has been so long celebrated, especially the Newcastle prize-plough, and one of their new patent double furrow ploughs of light draught, fitted with a new lifting apparatus which throws the plough out of work instantly, whilst a hind friction wheel in the centre enables the plough to be turned in its own length, and turnip chaff-cutters and cake breakers, complete their exhibits. Ashby, Jeffery and Luke, of Stamford, showed portable and vertical engines, chaff cutters, cake mills, root pulpers, haymakers, horse rakes, and horsegear work. Woods, Cocksedge and Warner, of Stowmarket, were well represented in their prize horsegear, carts, farmers' mills, a large assortment of cattle food machines, and by some combined steam engines and boilers. Ruston, Proctor and Co., of Lincoln, confined themselves to steam engines, of which they had examples of single and double cylinder portables with patent variable expansion, eccentric and other improvements, fixed horizontal and vertical engines. The Reading Ironworks, Limited, had examples of their horizontal and portable engines, which were so successful at Oxford, thrashing machines, mowers, and safety horsegear for horse power. Marshall, Sons and Co., Limited, of Gainsborough, had some excellent examples of their prize portable steam engines, thrashing machines, grinding mills and other machinery. Brown and May, of Devizes, also had in the Hall prize portable steam engines with patent feed-water heaters and other improvements. Wm. Foster and Co., of Lincoln, exhibited an eight-horse power portable steam engine; and W. Crosskill and Sons, of Beverley, several strong-made carts. C. Powis and Co., of Millwall, were represented by a ten-horse power horizontal steam engine, with steam-jacketted cylinder and expansion gears, and a plain circular sawbench suited for agriculturists and others.

Ascending the galleries, we come next upon the less bulky machines and implements. Wm. Smith, of Louthorpe, exhibited one of his patent slide racks, which keeps the food dry, and was commended at Oxford. Joseph Apsey and Co., of Reading, produced their Eclipse chaff cutter, which professes to do a great deal. Southwell and Co., of Rugeley, brought prominently forward their chaff cutter and oil-cake breaker, with new registered, fluted tooth roller; disc root pulpers, strippers, and slicers; and their registered economical sheep rack. They had also on their stand one of their ridging ploughs, with apparatus for instantaneous expansion or contraction; and their Oxford prize cheese press, exceedingly strong, simple and cheap, and easily regulated from $\frac{1}{2}$ cwt. to 4 tons. Thomas and Taylor, of Salford, showed, among other domestic articles, one of their eccentric churns, which received the Royal Society's prize at Manchester. Thomas Lloyd and Sons,

of Old-street Road, had varieties for inspection of their flour mills, adapted to hand or power. Robert Boby, of Bury St. Edmunds, had one of his corn screening and dressing machines, which finishes corn from a single blast thrashing machine fit for market in one operation; also a hay-maker, which took the silver medal at the North Lancashire Agricultural Society. Carson and Toone, of Warminster, exhibited a great many chaff-cutting engines of different prices, cheese presses, horse gear, and turnip cutters, also Meikle's automatic lamb-creep for fold hurdles. The Vulcan Iron Works Company, of Ipswich had a self-acting counter balanced rake with improved teeth and driving seat, and a patent adjustment for raking the furrows, also sheep racks and useful style of carts. Wm. Rainforth and Son, screen makers, of Lincoln, showed their patent adjustable rotary corn screen for finishing grain. Metcalfe and Co, of Manchester, had a variety of useful machines for sharpening the knives of mowing machines. James Phene, of Braintree, some root graters and pulpers. John Davey, of Croft-hole, near Devonport, introduced his Excelsior Champion plough. Philip Johnston, of Oxford-street, showed some of his butter churns in operation, which had been rewarded at the last two shows of the Royal Agricultural Society, and other dairy utensils. Amies, Barford and Co., of Peterborough, a firm which carried off many high honours at Oxford, had on inspection their prize steaming apparatus, metal corn-grinding mill and flour-dressing machine, and oilcake mills, and Perkins's improvements in reaping and mowing machines, consisting of in-and-out motion and patent folding shafts for travelling. R. P. Taylor and Co., of Swan-lane, had a miscellaneous collection of chaff cutters, Indian corn crushers, corn and flour bins and grindstones. Robert and John Reeves, of Westbury, showed their broadcast artificial manure distributor, which gained the prize at the Manchester Show, sundry manure and seed drills, Richmond's patent water cart, which took the prize at the Gloucester Agricultural Society's meeting at Stroud, and Chandler's patent liquid manure drill made by Reeves. T. Sheen, of Aylesbury, exhibited a dozen varieties of chaff cutters. Robert Maynard, of Cambridge, had one of his patent portable power chaff engines, which gained a silver medal at Oxford, and which will cut straw into short chaff as fast as it can be supplied by a straw thrashing machine. James Coultas, of Grantham, exhibited some of his general purpose and other drills, which have gained prizes at the Paris Exhibition and so many of the local shows. W. Waide, of Leeds, showed some good barrel churns. Albert Watson, of Andover, some bone mills. W. Gilbert, of Shippon, Abingdon, a seed drill. George Ball, of Rugby, had one of his improved carts, which have gained several first prizes at local shows this year. Murton and Turner, of Kenninghall, Norfolk, had on their stand some single and double-row hand drills, and one twelve row drill for small occupations, a corn-dressing machine, and other implements. E. H. Bentall, of Maldon, had a large collection of his celebrated cattle food preparing machines, in oil-cake mills, corn crushers, disc pulpers, chaff cutters, and Gardner's turnip cutters, which do not choke. Smith and Grace, of Thrapton, also exhibited chaff cutters. J. Baker, of Wisbeach, had some of his efficient blowing, winnowing, and screening machines, which having been well spoken of, and gained several prizes, surely did not want the fictitious aid of a very mean attempt at deception in the misrepresentation of the medals gained, which are tripled on their show-card into bronze, silver, and gold, a clever, but not an honourable or business-like mode of multiplying awards. Coleman and Morton, of Chelmsford, exhibited some of their well-known cultivators, which have carried off in competition more than 80 prizes. Hunt and Pickering,

of Leicester, exhibited some of their two-horse mowing machines, and compound reaper and mower; their new patent knife-bar is suitable for any mower or reaper; the reaper has only one spur-wheel, with pinion enclosed within the outer or carriage wheel. The one-horse reaper will cut a breadth of five feet clear. Each pin has its own lubricator. Their turnip-cutter that took the prize at the Oxford meeting, and oil-cake breakers were also shown. Thomas Corbett, Shrewsbury, produced some of his champion double and single ploughs, winnowing and corn-dressing machines, metal grinding mills, turnip drill, and turnip hoe and grubber. H. and G. Kearsley, of Ripon, had one of their prize combined reaping and mowing machines. W. N. Nicholson, of Newark, exhibited small vertical steam engines, and also improved horizontal engines, combining compactness, strength, and extreme simplicity, on an entirely new design: the governor being made in 6 parts instead of 16 or 20, is very sensitive and very simple. The steam pipe being within the boiler condensation is avoided. These engines are very compact for shipment. They also showed some haymaking machines with forward and reverse motions, and horse rakes. Geo. Stacey and Sons, of Uxbridge, make chiefly chaff machines, horse gear, and small portable drills. C. Denning and Co., of Chard, exhibited their chain corn drills, for which they claim advantages over the cup drills. Richmond and Chandler, Salford, exhibited chiefly cheap chaff cutters, corn crushers, and horse gear work. Pickaley, Sims and Co. (Limited), made a good display of their prize chaff cutters and pulpers, oat and bean mills, horse gear standard mowing and reaping machines, and combined mowers and reapers, all of which have been so successful during the past year in competition with machines of the leading makers. Riches and Watts, of Norwich, had a large selection of their American grist mills. Hayes and Son, of Stamford, had many specimens of their prize carts, waggons, and drays. Thos. Perkins, Hitchin, some excellent drag harrows, shafts for reaping and mowing machines, and double-furrow ploughs with patent arrangements for steering and lifting clear of the ground at the land's end. The American implement makers were represented by Burgess and Key, J. G. Rollins, and W. A. Wood. Burgess and Key, of Brentwood, had McCormick's reaper with sheaf-delivery, a one-horse hand delivery machine, and their mowing machine adapted to cut corn; also a new and improved self-raker reaping machine, like those of Samuelson and Hornsby, the rakes being driven by one wheel and pinion, the size of which can be varied to regulate the size of sheaves. J. G. Rollins, of London, had a large collection of American hay and manure forks and rakes, spades and shovels, grindstones and sharpening stones, American axes, churns, pumps, &c. Walter A. Wood, of Thames-street, had reaping and mowing machines and Nova Scotia grindstones; but the wood frame mowers formerly relied upon seem giving place to iron frame mowers. One or two of the principal Sheffield tool houses were represented in the firms of Spears and Jackson, and Vickers, Sons and Co. The seedsmen were in strong force, and seldom has there been a finer collection of samples of roots. All the well-known houses were represented, including Messrs. Thomas Gibbs and Co., of Half-Moon-street; George Gibbs and Co., of Down-street; Sutton and Sons, of Reading; James Carter, of Holborn; Harrison and Co., of Leicester; Raynbird, Caldecott, and Co., of Basingstoke; Jno. K. King, of Coggeshall; J. C. Wheeler and Sons, of Gloucester; W. Hope, of Barking; and Alfred Hall, of Westbury. Suttons exhibited some of their prize yellow globe mangolds, which yielded 62 tons to the acre, and sugar-beet 44 tons to the acre, on the Barking Sewage

Farm. But even heavier crops than this have been produced—for Messrs. Sutton cite a yield of 85 tons per acre of the yellow globe, an enormous produce. One long red mangold shown weighed 46 lbs. Mr. W. A. Gibbs, of Gillwall Park, exhibited a model of a hot-blast and sheaf-house for drying hay, flax, and other grasses, and of a machine for drying seeds, or spent hops for litter,

The following is a complete list of the Exhibitors of Implements:

DOWN-STAIRS DEPARTMENT.

Gwynne, Engineers, 89, Cannon-street, E.C., and Hammer-smith Iron Works.
 Powis and Co., 60, Gracechurch-street, E.C., and Cyclope Works, Millwall Pier, London, E.
 Robey and Co. (Limited), Lincoln.
 Wallis and Stevens, North Hants Iron Works, Basingstoke.
 Garrett and Sons, Leiston Works, Suffolk.
 Hornsby and Sons, Spittlegate, Grantham, Lincolnshire.
 Harrows and Stewart, Banbury.
 Tasker and Sons, Engineers, Waterloo Iron Works, Andover, Hampshire.
 Tuxford and Sons, Boston, Lincolnshire.
 Fowler and Co., 71, Cornhill, E.C., and Steam Plough Works, Leeds, Yorkshire.
 Clayton and Shuttleworth, Lincoln, and 78, Lombard-street, London.
 Nalder and Nalder (Limited), Challow Iron Works, Wantage, Berkshire.
 Burrell, St. Nicholas Works, Thetford, Norfolk.
 Underhill, Newport, Salop, Agricultural Engineer.
 Humphries, Pershore, Worcestershire.
 James and Frederick Howard, Britannia Iron Works, Bedford.
 Aveling and Porter, Rochester, Kent.
 Holmes and Sons, Prospect-place Works, Norwich, Norfolk.
 The Beverley Iron and Waggon Company (Limited), Beverley Yorkshire.
 E. R. and F. Turner, St. Peter's Iron Works, Ipswich.
 Eddington and Co., Chelmsford, Essex.
 Ransomes, Sims, and Head, Orwell Iron Works, Ipswich.
 Ashby, Jeffery, and Lake, Stamford.
 Woods, Cockedge, and Warner, Suffolk Iron Works, Stowmarket.
 Raston, Proctor, and Co., Sheaf Iron Works, Lincoln.
 The Reading Iron Works (Limited), Reading.
 Marshall, Sons, and Co. (Limited), Britannia Iron Works, Gainsborough.
 Philip and Henry Philip Gibbons, Iron Works, Wantage, Berkshire.
 Brown and May, North Wilts Foundry, Devizes.
 Crowskill and Sons, Beverley, Yorkshire.
 Foster and Co., Wellington Foundry, Lincoln.

IN THE GALLERIES.

Smith, Poston, Lowthorpe, Hull, Yorkshire.
 Salmon, Bermondsey, Chemical and General Manure Manufacturer.
 Peirce, 109, Hatton-garden, London.
 Peasey and Co. (Limited), City Iron and Wire Works, Lincoln.
 Thomas Gibbs and Co., "Seedsmen" to the Royal Agricultural Society of England, Half-moon-street, Piccadilly, London, W.
 Arnold and Sons, Instrument Makers, West Smithfield, London, E.C.
 Wheeler and Son, Gloucester.
 Haddon, Albert Works, Strangeways, Manchester.
 George Gibbs and Co., Seedsmen, Down-street, Piccadilly.
 Unite, 291, Edgware-road, Paddington, W.
 Clarke Brothers and Odling, Kirk White-street, Nottingham.
 Day, Son, and Hewitt, 22, Dorset-street, London, W., Animal and Agricultural Chemists.
 Raybird, Caldecott, Bawtree, Dowling, and Co. (Limited), Corn, Seed, Manure, and Oilcake Merchants, Basingstoke.
 White and Son, Great Bentley, near Colchester, Essex.
 Duffield, 23 and 60, William-street, Regent's-park, London, N.W.

White and Co., 15, Trinity-street, Borough, London.
 Fox and Co., 12, High Holborn.
 Dowling, 2, Little Queen-street, Holborn.
 Bellamy, Byng-street, Millwall, London.
 Jelley, Son, and Jones, Iron and Grindstone Merchants, 196, Blackfriars-road, London.
 Inglis and Co., 88, Castle-street, Holborn, London, E.C.
 Haynes and Sons, Edgware-road, London, W.
 The Farmers' Supply Association (Limited), 69, King William-street, London, E.C.
 Davis, Globe Wharf, Mile End, London.
 Croggon and Co., Felt Manufacturers, Upper Thames-street, London.
 Chappell and Parry, 55, Holywell-lane, Shoreditch, E.C.
 Apsey and Co., 47, Soho-street, Reading, Berkshire.
 Angel, 171, Fleet-street, E.C.
 Vallance, Engineer, Cannon-street, London.
 The Agricultural and Horticultural Co-operative Association (Limited), 29, Parliament-street, Westminster.
 Bayliss, Jones, and Bayliss, 84, Cannon-street, London.
 King, 11, Bermondsey-street, London.
 James and Co., Engineers and Machinists, Great Suffolk-street, Borough.
 Hunter, Implement Works, Maybole.
 Dodge, India Rubber Manufacturer, 79, Upper Thames-street, London.
 Eagles, 23, Fenchurch-street, London.
 The Atmospheric Churn Company, 119, New Bond-street, London.
 Brown and Co., 39, Charlotte-street, Blackfriars-road, London.
 Brook and Co., Garden Engines, 10, Featherstone-buildings, London.
 Harrison and Sons, Royal Midland Seed Warehouse, Leicester.
 Lyon, 32, Windmill-street, Finsbury, London.
 Edgington and Co., 52, Old Kent-road, London.
 Carter and Co., the Royal Seedsmen, 237, High Holborn, London.
 Hare and Co., Draughtsmen and Engravers on Wood, 31, Essex-street, Strand.
 Edgington, 2, Duke-street, London Bridge.
 King, Seed Grower, Coggeshall, Essex.
 Pollard, Jephson, and Co., Southwark, London.
 Sutton and Sons, Royal Berks Seed Establishment, Reading.
 Owens and Co., Whitefriars-street, London.
 Cottam and Co., 2, Winsley-street, Oxford-street, London.
 F. and C. Hancock, 6, Victoria-terrace, Dudley, Worcester-shire.
 Callingford, Wellington-road, Forest Gate, Essex.
 Stacey and Sons, Uxbridge, Middlesex.
 Burney and Co., Millwall, London.
 Hancock and Co., Sutton Coldfield, Warwickshire.
 I. and T. Hepburn and Sons, Long-lane, Southwark.
 Ball, North Kilworth, near Rugby.
 Tree and Co., 22, Charlotte-street, Blackfriars-road.
 Fardon, Linalade Iron Works, Leighton Buzzard.
 Gilbert, Shippon, Abingdon, Berkshire.
 Reynolds and Co., 56 and 57, New Compton-street, London.
 Ravenscroft, Farmer Office, Salisbury-square, Fleet-street.
 Southwell and Co., Agricultural Engineers, Albion Iron Works, Rugeley, Staffordshire.
 Thomas and Taylor, Victoria Bridge, Salford, Manchester.
 The Ravensthorpe Engineering Company, Ravensthorpe, Mirfield.
 Randell and Sons, North Walsham, Norwich, Norfolk.
 Teighe and Smith, Bridge-road, Limehouse, London.
 Lloyd and Sons, 15, Old-street-road, London.
 Brown and Co., 90, Cannon-street, London.
 Davey, Excelsior Plough Works, Croft-hole, near Devonport, Cornwall.
 Lewis and Hoole, Salopian Iron Works, Shrewsbury.
 Rainforth and Son, Brayford Head, Lincoln.
 Goodwin, Engineer, Great Guildford-street, Southwark.
 Mitchell and Co., Engineers, 3, Hunt-street, Brook-street, Manchester.
 Hughes and Sons, 21, Mark-lane.
 Peene, Rayne Foundry, near Braintree, Essex.
 Denton, St. Peter's Works, Wolverhampton.
 Joseph and James Lane, Engineers and Boiler Makers, 10, Cranbrook-street, Old Ford-road, London.
 Herbert and Sons, Scale Makers, 319, Gray's-inn-road.

Tangye Brothers and Holman, 10, Lawrence Pountney-lane, London.
 F. and G. Rosher, Upper Ground-street, Blackfriars.
 The Driffield and East Riding Pure Linseed Cake Company (Limited), Driffield, Yorks.
 Johnstone, 290, Oxford-street, London.
 Newton, Manor Works, Manor Road, Bermondsey.
 Tipper, Chemical Works, Balsall Heath, Birmingham.
 Amies, Barford, and Co., Queen-street Iron Works, Peterborough.
 Burgess and Key, 96, Newgate-street, London.
 McNiell and Co., Bunhill Row, London.
 E. and H. Roberts, Deanshanger Iron Works, Stony Stratford, Bucks.
 Mellard's Trent Foundry (Limited), Midland Agricultural Works, Rugeley, Staffordshire.
 Smith, Royal Iron Works, Kettering, Northamptonshire.
 Nicholson, Trent Iron Works, Newark.
 Murray and Co., Banff Foundry, Banff.
 Foster and Sons, Star Iron Works, Witham, Essex.
 Milburn, 7, Told-street, Manchester.
 Samuelson and Co., Britannia Works, Banbury, Oxfordshire.
 Hope, Parsloes, Barking, Essex.
 Murton and Turner, Agricultural Implement Manufacturers, Guiltcross Works, Keninghall, Norfolk.
 Norris and Co., Shadwell, London, E.
 Ransome and Co., 10, Essex-street, Strand, London, W.C.
 Priest, Woolnough, and Michell, Ceres Iron Works, Kingston-on-Thames.
 Bentall, Heybridge Works, Maldon, Essex.
 Spear and Jackson, Etna Works, Sheffield.
 Sheen, Aylesbury, Bucks.
 Maynard, Whittlesford Works, near Cambridge.
 Coultas, Perseverance Iron Works, Spittlegate, Grantham, Lincolnshire.
 Waide, 5, South Brook-street, Hunslet Lane, Leeds.
 Watson, Acre Iron Works, Andover.
 Taylor and Co., 4, Adelaide Place, London Bridge.
 Ray, Mead, and Co., 38, Upper Thames-street, London.
 Bobey, St. Andrew's Works, Bury St. Edmunds, Suffolk.
 Whitmee and Co., 101 to 103, St. John-street, London.
 Holgate and Co., 33, Dover Road, Borough.
 Hill and Smith, Brierley Hill Iron Works, Staffordshire.
 Glanvill (late Boyd and Co.), 48, Cannon-street, London.
 Tyler and Co., Engineers, 84 and 85, Upper Whitecross-street, London, E.C.
 Reid and Co., Bon-Accord Works, and Guild-street, Aberdeen.
 Headley and Son, Exchange Iron Works, Cambridge.
 Cottis and Sons, of Epping, Essex.
 Smyth and Sons, Peasenhall, Suffolk; Witham, Essex; Paris (Rue Magnan, 17).
 Jones, Milton House, Worcester-street, Gloucester.
 Matthews, Son, and Co., Driffield, Yorkshire.
 Handley and Co., Millstone Builders, &c., York-road, Stepney, Middlesex.
 Gooday, Chelmsford.
 Matthews and Co., 139, Cannon-street, City, E.C.
 Alway and Son, 37, Chapel-street, Pentonville, London, N.
 Perkins, Hitchin.
 Morton and Co. (Limited), Liverpool, Lancashire.
 Pinfold, Warwickshire Iron Works, Rugby.
 Richards, 41, Wellington-street, Covent Garden, W.C.
 Boulton and Co., Rose Lane Works, Norwich.
 H. and G. Kearsley, Ripon, Yorks.
 Follows and Bate, Manchester.
 Corbett, Perseverance Iron Works, Shrewsbury.
 Kingston and Trowbridge, 107, Old-street, St. Luke's, London, E.C.
 Kittmer, Fulstow, Louth, Lincolnshire.
 Hodgson, Louth, Lincolnshire.
 Hunt and Pickering, Leicester.
 Gibbs, Gillwell Park, Sewardstone, Essex.
 R. and J. Reeves, Bratton Iron Works, Westbury.
 Hall, Westbury Farm, Westbury, Wilts.
 Notcutt and Peters, the Vulcan Iron Works Co., Ipswich, Suffolk.
 Carson and Toone, Wiltshire Foundry, Warminster, Wilts.
 Baker, Compton, Newbury, Berks.
 Riches and Watts, Duke's Palace Iron Works, Norwich.
 Hayes and Son, Scotgate Works, Stamford.

Le Butt, Corn Screen and Haymaker Works, Bury St. Edmunds, Suffolk.
 Warren, Iron Foundry, Maldon, Essex.
 Sawney, Beverley, Yorkshire.
 James, Tivoli Works, Cheltenham.
 Wedlake, Hornchurch and Romford, E., Essex.
 Cambridge and Co., St. Philip's Iron Works, Bristol.
 Corcoran, Witt, and Co., 41, Mark Lane, London.
 Hobbs, Basingstoke.
 Ball and Sons, Rothwell, Northamptonshire.
 Denning and Co., Chard, Somerset.
 Rollins, Old Swan Wharf, London Bridge.
 Wood, 77, Upper Thames-street, E.C.
 Hunt, Earl's Colne, Essex.
 Page and Co., Victoria Iron Works, Bedford.
 Larkworthy and Co., Lowesmoor Iron Works, Worcester.
 Bristol Wagon Works Company (Limited), Temple Gate, Bristol.
 Dell, 72, Mark Lane, E.C.
 The St. Pancras Iron-Work Company, Engineers, Old Saint Pancras Road, London, N.W.
 Pickaley, Sims, and Co. (Limited), Bedford Foundry, Leigh, Lancashire.
 Bradford and Co., 63, Fleet-street, London, and Cathedral Steps, Manchester.
 Norton, 21, Mark Lane, London, E.C.
 Richmond and Chandler, Salford, Manchester.
 Coleman and Morton, London Road Iron Works, Chelmsford, Essex.
 Baker, Falcon Works, Wisbeach.
 Smith and Grace, Thrapston.
 Hensman, Ampthill, Beds.

ANNUAL MEETING.

On Tuesday the annual meeting was held in the Board Room of the Club, the Earl of Powis in the chair. There was more than the usual attendance of members.

The following report of the Council was read by the honorary secretary, Mr. Brandreth Gibbs, and on the motion of Mr. Cantrell, seconded by Mr. Ellman, adopted.

The Council beg to lay before the General Meeting their Annual Report for the past year. The Council have held four meetings, which have been well attended. In addition to the ordinary routine business of the Club, the following subjects have had their consideration:

I. The revision of the prize sheet for the present Show, and the following alterations have been made: 1st. In the Scotch horned cattle, separate classes have been established for the West Highland breed. 2nd. In the divisions for sheep of the Leicester, Cotswold, Lincoln, Southdown, Hampshire or Wiltshire, Shropshire and Oxfordshire breeds, new classes have been established for ewes. 3rd. The champion prize plate of £100 value, for the best beast in the Show, has again been offered; also the champion plate of £50, for the best pen of sheep in the Show; but the offer of plate for the best single sheep has been discontinued. The champion plate for cattle has been won by Mr. Thomas Pulver, of Broughton, Northampton, for his ox, exhibited in the extra stock in consequence of its having been shown in the classes last year. The champion plate for sheep has been won by the Right Hon. Lord Walsingham, for his pen of 20-months' Southdown wethers, exhibited in class 46. It has been determined to limit the competition for the silver cups for sheep in the Shropshire, Oxfordshire, and cross-bred divisions to one-year-old sheep, as has always been the case in the Southdown division. 4th. The silver medals for single sheep in extra stock have also been discontinued, and a silver cup, not exceeding £5 in value, substituted. The same alteration has been made for the best pig in extra stock. 5th. Various minor alterations in the amounts of prizes have been made. 6th. The wording of the rules of exhibition have been amended.

II. The subject of the appointment of judges has had the further consideration of the Council, and it was resolved that no person who will act as judge at the Birmingham Show the same year shall act at the Smithfield Club Show.

III. The divisions to be adjudicated upon by each set of judges has been revised, so as to distribute the amount of work more evenly than heretofore.

IV. The Council have taken additional precaution to prevent unqualified persons obtaining admittance into the hall previous to the appointed time. The animals have thus remained undisturbed, and obtained the rest so requisite after long journeys to the Show.

V. The Council have accepted the offer of the Right Honourable the Earl of Powis, the President of the Club, to give a prize of £20 for the best instrument for slaughtering animals, which shall be an efficient substitute for the pole-axe, by separating the spinal marrow. The competing instruments are to be delivered at the office of the Honorary Secretary on or before the 1st of October, 1871: and the exhibitors are required to show their instruments in practical operation at such times and places as the judges appointed by the Club shall determine.

VI. The Council have elected Mr. C. Stephenson, of Park Farm, Woburn, Beds, to fill the vacancy caused by the death of Mr. Thomas Twitchell, who for many years was a successful competitor at the Club's Shows, and had lately filled the office of Steward of Live Stock.

VII. The Council having observed with regret the small attendance at the Club's annual dinner, notwithstanding a dining hall adjoining the show has been provided, on the last two occasions, have determined to discontinue the dinner this year.

VIII. The Council also determined to discontinue the report on the animals exhibited at the Show, as however interesting such might be during the time the exhibition remain open, it appears there has not been sufficient materials for the compilations of such a report as should possess permanent value for future reference sufficient to make it desirable to incur the expense of its preparation and printing.

IX. The Council have again voted their thanks to the Rector of Islington, for the special service on Sunday last, for the herdsmen and shepherds, who attended in large numbers.

X. The Lords of the Privy Council have again granted special permission for animals exhibited at the Club's Show to be removed beyond the Metropolitan boundary. A certificate signed by one of the Club's veterinary inspectors must, however, be obtained, attesting that the animals to be so removed do not exhibit any indication of infectious or contagious disease.

XI. The Council beg to lay before the meeting the annual balance-sheet of the Club from December 1st, 1869, to December 1st, 1870. Of the balances in hand amounting to £2,788 19s. 3d., and Stock in Three per Cent. Consols £4,513 10s. 11d. The statement will be printed, and a copy furnished as usual to each member of the Club.

In conclusion, the Council again congratulate the members on the continued prosperity of the Club.

Signed by Order of the Council,

(Signed) B. T. BRANDRETH GIBBS,

Hon. Secretary.

The presentation of the Champion Plate and silver cup was then made.

The President having handed the £100 plate to Mr. Pulver as the exhibitor of the best beast in the show,

Mr. PULVER, in expressing his acknowledgments, said it was now 20 years since he first appeared as an exhibitor at the Club's Show, and when he did so he was unsuccessful, although he obtained a commendation. Some of his friends then told him that it was useless for him to show in the same class with noblemen and gentlemen, the length of whose purses made them more than a match for his skill and perseverance (Hear, and a laugh). However, in spite of this counsel, he resolved to persevere, and subsequently he had taken a great number of prizes, alike first, second, and third, as well as received some commendations; and he did not cease his exertions until he had carried away the first honours of the yard (cheers). He ventured to say that his ox had made more money than any ox in England before; for he had taken 23 first prizes, two second, and one third, the total amount of which was £368 5s. When he had done exhibiting, too, he should receive £100 for him. Next week he would go to Leeds, and if liked there, he anticipated that he would win 50 guineas more. That he thought would be making more money than any other animal had ever done (loud cheers).

The next presentation of plate was that of £40 value to

Lord Walsingham, the exhibitor of the best pen of sheep in the Show.

Lord WALSHINGHAM, in returning thanks said, he supposed he must follow the example of the gentleman who had just received the largest and most valuable prize, by making a little bit of a speech, and he promised that it should be a short one. In adopting the breed of the South Downs he was mainly influenced by the idea of producing good mutton (Hear, and cheers). When he entered into possession of his farm, about 30 years ago, he found a flock set down upon it, and from that time to this it had been rising little by little, until he had been able to gather great honours (Hear, and cheers). He thanked the Club for giving him the opportunity of winning such a magnificent specimen of art, and he hoped that he should be equally successful in another year (applause).

Mr. TREVOR LEE SENIOR having been presented with a silver cup, value £40, for the best cow or heifer in any of the classes, remarked that that was the first year he had been an exhibitor at the Smithfield Club Show, and that he intended, if possible, to "keep it up," and win again for many years to come.

For the silver cup, value £20, given to Mr. John Overman, for the best pen of one-year-old Shropshire, Oxford cross-bred, or any other breed of sheep in any of the classes, Mr. ROBERT OVERMAN returned thanks, in the absence of his relative from indisposition; and added the expression of a hope that the day was not far distant when he would change places with Lord Walsingham, and take the plate (Hear, hear, and laughter).

Mr. BENJAMIN, in accepting the cup for best pen of pigs in any of the classes, observed that that was only the second year of his appearance as an exhibitor at the Show, but the second time he had gained a prize (cheers).

Lord BRIDPORT had the honour to propose the election of the right. hon. Lord Penrhyn as President of the Club for the year 1872. The noble lord was well known to have been a successful exhibitor on many occasions at the Smithfield Club Show, and would be happy to accept the office of President if the members would do him the honour of electing him (cheers).

The motion was seconded by Mr. Duckham, and agreed to unanimously.

The Vice-President, Trustees, and Honorary Secretary were then re-elected, and the retiring Members of the Council, namely, Mr. Downing, Mr. James Howard, M.P., Mr. Keary, Mr. Leeds, Mr. R. Overman, Mr. Quartly, Mr. Robinson, and Mr. Senior—were replaced by the following house list: Mr. Thos. C. Booth, Warlaby, Northallerton; Mr. John Giblett, Glebe Villa, Church-street, Stoke Newington; Mr. Richard Hornsby, Spittlegate, Grantham; Mr. E. W. Moore, Coleshill, Highworth; Mr. Henry Overman, Weasenham, Brandon; Mr. T. L. Senior, Broughton House, Aylesbury; Mr. Wm. Taylor, Thingehill Court, Hereford; and Mr. J. S. Turner, Chyngton, Seaford, Sussex.

Prior to the election of the Council Mr. HEATH suggested that, as the number of members had so greatly increased, it would be well if the "house list" were in future to contain twelve names, from which eight might be selected to supply the vacancies occasioned by the retiring members of Council.

The PRESIDENT replied that, although the "house list" comprised but eight names, gentlemen were at liberty to strike out any or all of them and substitute others for them.

Mr. DUCKHAM remarked that Mr. Heath and other gentlemen did not like to be restricted to the "house-list," which was only placed in their hands just before the election. If instead of adopting the present practice the Council were to send round a "house-list" of ten or twelve, with the ticket of admission to the yard, to every member who had paid up his subscription, time would thus be given to look through the list and mark off the names approved of. By that means they would be free from the imputation of committing themselves to foregone conclusions with reference to the acts of the Council, and dissipate the feeling that they were a close corporation and self-elected body (Hear, hear).

Mr. BEASLY thought the explanation of the president sufficiently satisfactory; moreover, if any alteration was to be made in the system of election, due notice ought to be given of the proposal. It was impossible to adopt any amendment on the present occasion.

Mr. DUCKHAM: It was merely a suggestion thrown out for another year.

Mr. WILLMORE said that Mr. Duckham had faithfully expressed the sentiment entertained by a large number of members, who thought with him that the Council was rather too much of a close borough (Hear, hear). If the voting papers were in the hands of members at an earlier period, it would be one way of meeting the objection, particularly if it contained the names of twelve persons from whom gentlemen might select eight.

Mr. FREDK. MARTIN complained that there was no Kentish man upon the list, and said he should like to have seen one there.

The PRESIDENT: Gentlemen, I would observe that the existing bye-law provided that the Council should prepare a list of the eight members whom they proposed for election, and that a copy of the list should be given to every member who applied for it to the secretary on the day of the general meeting, or during any one of the three days previously—Sunday excepted. If it were desired that on future occasions the list should be sent round to members a little earlier, with the ticket of admission to the yard, that matter could be brought before the Council and considered. It was open to anyone at this meeting, however, if he thought his county or district was not represented, to substitute any names he might consider proper for those in the house-list.

Mr. Brandreth Gibbs read the following abstract of the audited balance-sheet:—

ABSTRACT STATEMENT from December 1st, 1869, to December 1st, 1870.			
RECEIPTS.			
Balance in the hands of Bankers, December 1st, 1869	...	£2,671	0 5

	WILLIAM B. CANNING.		
	J. S. TURNER.		

After several new members had been elected,

The MARQUIS of EXETER rose and said it now became his pleasing duty to ask the meeting to vote its thanks to his noble friend the Earl of Powis, for the able and zealous manner in which he had performed the duties of President of the Club for the year 1870, and for his conduct in the chair that day. All who were acquainted with his noble friend knew that whatever he took in hand he executed to the best of his ability; and he was quite sure, although he (the Marquis of Exeter) had unfortunately from various causes been absent during that year, that his noble friend had conducted the business of the Club with his usual ability, actuated by the single desire of promoting the success of the institution (cheers).

Mr. C. S. READ, M.P., had much pleasure in seconding the vote of thanks to Lord Powis for the admirable manner in which he had discharged the duties of president for the year. If he might be allowed, whilst on his legs, he would like to throw out a suggestion for the consideration of the Council, when they came to revise the prize list for next year. He would like to direct attention to class 62 in the catalogue—that was to say, the light-weight cross-bred sheep, described as "Long and short woolled cross-bred fat wether sheep, 1 year and under 23 months old, not to exceed 220lbs. live weight." He thought it undesirable that a great national club like this should encourage a weight that was not required. The light weight of a Southdown he could understand; but the light weight of a cross-bred, if it were of good quality, was something that he could not understand. Even with the Southdowns, when he saw that Lord Walsingham could bring them out at one year almost as heavy as if they were two years old, it seemed to him that the days of light weight for Southdowns were nearly at an end (Hear, hear). But with regard to cross-bred sheep, which he looked on as the sheep for the million, he contended that the bigger and better they were the more advantageous would it be alike for the farmer and the consumer. He hoped then that the prizes for cross-bred sheep would not be reduced, but rather let them add to the number of prizes for yearling sheep. It was the most important class in the yard; and if it were possible to subdivide it by allowing the cross-bred mountain sheep to appear in another class he should not object, but he urged on the Council the desirability of striking out such an unnecessary class as that to which he had called attention (loud cheers).

The motion was carried amid cheering.

The EARL of POWIS was very much obliged for the compliment, and assured the meeting that it had given him great pleasure to have been selected as their President during the current year. The Smithfield Club was one of the most ancient agricultural societies in the kingdom, and he was happy to believe that it was increasing every year in respect of the merits of the animals shown, and so far as the accommodation allowed, in numbers. They had that morning been honoured with a visit of the Prince of Wales, who had gone over the show, and the Council had been in attendance upon him up to the hour of the annual meeting. With respect to the point which Mr. Read had mentioned for the consideration of the Council, he confessed that, as a Welshman, he was glad to hear that gentleman put in a salvo which would give the cross-bred mountain sheep some chance in the classes. Without discussing the question whether it was desirable to encourage light weight cross-bred sheep, from what he knew of the tame sorts he ventured to think that a cross-bred Welshman would have very little chance if he were exhibited against what he might term low country sheep. The gradual increase of enclosures in all the hilly parts of the country, the spread of wire fences, which confined the flocks within legitimate bounds, and the gradual extension of culture on the sides of the hills by the help of these enclosures, naturally made the mountain farmer anxious to increase the weight of his sheep by crossing with some of the lowland sorts. By that means he got a more profitable animal, and the infusion of hill blood and qualities did not prejudice the goodness of the mutton (Hear, hear). Then, as to the suggested alteration of the house-list, it would be within the competence of the Council to circulate the list prior to the annual meeting, at the time when the card of admission to the yard was sent to each member. That arrangement would give them more time to make up their minds as to whom they desired to introduce into the council; but to vary the form of the house-list by extending it to twelve names, would require an alteration

of the bye-law, and any proposition which involved that result must, of necessity, be brought forward upon a notice to be given before the 1st of November next year. It could then be considered at the general meeting to be held this time twelve months. There was yet one other matter to which he was desirous of calling attention, though it was not mentioned in the report. On coming to town last Saturday he found awaiting his arrival a letter from M. Drouyn de Lhuys, who was well known to most people as having been an eminent minister under the French Empire, who was president of the French Society of Agriculture, established about three years ago, and an honorary member of the Royal Agricultural Society of England. M. Drouyn de Lhuys had received a letter from Mr. Jas. Howard, member for Bedford, inquiring whether it would be acceptable if a committee were formed in England to provide for those unfortunate French agriculturists who had suffered the loss of their produce by the presence of an invading army contributions, either in money or in kind, of the necessary seeds for their next crop. M. Drouyn de Lhuys replied that the proposal was one which he received with the utmost gratification, and he immediately wrote to the Minister of the Interior to know whether the French Government would afford the requisite facilities for such an organisation. To this the Minister answered that if such a scheme were set on foot he would direct that those facilities should be afforded either at Cherbourg or at Brest, and further that he would also communicate with the prefects of the Departments and the maires of the smaller divisions, so that means might be adopted for such supplies, whether in money or in kind, being properly distributed amongst those who were *bona fide* agriculturists that had suffered the loss of their seeds and crops by the war, and that precautions might be taken that no one should receive an undue proportion. M. Drouyn de Lhuys added that upon being made aware that Mr. Howard had not been able, in consequence

of illness, to communicate the nature of the scheme to the public, he had written him (Lord Powis), as president of the Smithfield Club, upon the subject, in the hope that, as the annual meeting of the Club was to take place that day, publicity might be given to the scheme either through the medium of the Club's transactions or of the newspaper press. Moreover, his Excellency had given full permission to communicate to the members of the Club the letter he had written to him (Lord Powis), together with the letter he had addressed to Mr. Howard in answer to his suggestion, and the letter received by M. Drouyn de Lhuys from the French Minister of the Interior. He need hardly say that a hostile army in any country would be sure to eat up everything in the shape of food, fodder, and seed; and that this was a most grievous calamity to the occupiers of the land, more especially in a country like France, where the number of small occupiers was very large in proportion. Even under the best-regulated system, when a "requisition" was made, and the memoranda for payment given, the loss of seed was a matter which could not be recompensed by money to the smaller cultivators. He hoped, then, that Mr. Howard's illness would not be of long duration, and that he would be enabled to carry the benevolent idea he had suggested into effect. The correspondence referred to would be placed in the hon. secretary's hands for translation into English, and then communicated to the papers. He also wished to say that if the scheme should go on, and any gentlemen were desirous of giving seed of any kind for this purpose, the hon. secretary would keep a register of the intended presents, and communicate with M. Drouyn de Lhuys, who was now residing in Jersey, so that proper information might be given to the donors as to the manner in which their gifts were to be transmitted (Hear, hear).

The meeting then separated.

THE CENTRAL FARMERS' CLUB.

THE SIZE OF FARMS.

The concluding discussion meeting of the year was held on Monday evening, December 5, at the Salisbury Hotel. The chair was taken, in the absence of the chairman of the year, Mr. James Howard, M.P., from indisposition, by Mr. H. Trethewy. The subject appointed for consideration—viz., "The Size of Farms"—was introduced by Mr. J. Trask, of Highleaze, Yeovil.

The CHAIRMAN said: Before we enter upon the business of the evening, I must offer a few words of apology for appearing before you in the position which belongs to the President. You are probably aware that that gentleman is labouring under bad health. The Committee exceedingly regret the cause of Mr. Howard's absence—a regret in which I am sure you all share (Hear, hear)—and they have done me the honour to request me to take the chair on this occasion (cheers). I feel that to be a great compliment, and I have great pleasure in presiding. Without further trespassing on your attention, I will now call upon Mr. Trask to introduce the subject fixed for your consideration—viz., "The Size of Farms."

Mr. TRASK then said:

When the subject for this evening's discussion was selected by the Committee, I am not aware that it had formed the principal topic of debate at a Farmers' Club. The size of farms, however, has been very frequently commented on by many eminent writers on political economy, and the greatest difference of opinion has prevailed on the question; but the innumerable discussions and inquiries arising out of the Irish land question have tended to throw a great deal of light upon the subject; and, since it has been placed on the card for discussion here, it has been referred to and debated on different occasions during the present year. The question, however, is by no means exhausted, and I am quite sure it will afford ample scope for our discussion this evening; and, from the elucidation which the subject has already received, we are enabled to express our opinions on it with the greater confidence. As different views have been

taken on this question, it has been said that it was looked at from an English or from a foreign point of view; but in this eminently practical assembly, I am certain that, whatever opinions are put forward, whether they may be considered either English or foreign, they will be your honest and conscientious opinions, and expressed with a view of placing the matter in a fair and just light before the country. In treating of the size of farms, it must be clearly understood that I am speaking of farms which are cultivated for the purpose of producing the staple food of the community, and affording at the same time a fair return on the cost of production. We sometimes hear of very large sums having been made from small plots of land, generally in an exceptional season, and from some particular kinds of vegetables perhaps, which there happened to be a temporary demand for just then; or from the successful raising of flowers; or, it may be, from an extraordinary crop of fruit, or other productions of a similar kind. But I need not stop to show, what must be quite obvious to everyone, that the soil of this country cannot be *generally* applied to the cultivation of a kind of produce for which there is a very limited demand; therefore, in the remarks which I shall make I shall leave gardens and gardening entirely out of the question, and refer to farms and farming, with a view, as I said before, of producing the staple food of the country, which is, and must always be, the question above all others of the greatest importance to the community at large. In referring to the comparative advantages and disadvantages of large and small farms, the systems that prevail in other countries have been invariably referred to as an illustration of what may be done in this country; but the circumstances of different districts of our own country even, vary greatly, much more do the circumstances of different countries vary, in the important elements of soil and climate particularly; and this is a fact that we should be careful to keep in view. I must not be understood to infer, however, that we can learn nothing from foreign countries, we are only too happy to adopt anything that is a

real improvement on our own system, come from whence it may, and I do not at all agree with that member of the Royal Agricultural Society who said that the cost of the article on the farming of Belgium, that appeared in their *Journal*, was a waste of the funds of that Society. "Look, for example," said this gentleman with indignation: "look at the opening article on 'Petite Culture' in the last number. Why, there was not a single thing described in that paper which an English farmer would think of imitating. In fact, the article was nothing but waste paper." The gentleman forgot, I think, that it is quite as desirable to know what to avoid as well as what to do; besides, the farming of Belgium was popularly believed to be something vastly superior to anything we have attained to in England. A very erroneous notion, that this article, prepared with so much ability by Professor Voelcker and Mr. Jenkins, has entirely refuted. But whether we look at the state of agriculture, or the condition of the peasantry of any of the continental states, as laid before us with so much ability and clearness, after a great deal of personal observation and inquiry in those states by the chairman of this Club, we can have little difficulty in coming to the conclusion that we have nothing to gain by following any of the continental systems, whatever we may advantageously learn from them in matters of detail. Under these circumstances I feel that I should not occupy your time very profitably if I went at any length into a comparison of the state of English as compared with the state of continental agriculture. This matter cannot be better left than it has been by our able chairman. I shall proceed, therefore, to an examination of the results of the two systems, of large and small farming, which are exemplified under similar advantages, as regards soil and climate in different parts of our own country. But it is not my intention to compare the details of a balance-sheet of either a large or a small farm, I consider that it is quite unnecessary to do so; and, as a rule, the publication of fictitious balance-sheets should be avoided. I trust, however, that there are present this evening the advocates of both systems, who will not hesitate to express their different views, for by so doing we can best remove the erroneous ideas and prejudices that surround the question before us. The advance which has taken place in the science of agriculture during the last quarter of a century or more, has been quite equal, I believe, to the progress that has been made during the same period in any of the other industries of this country. Notwithstanding this, however, our population has increased in a much greater ratio than has the produce from the land. In the generality of continental states, where the property is much sub-divided and the system of small farming prevails, the population is kept down by law, which prevents marriage taking place under a certain age, or till the parties have reasonable means of subsistence; in other states, as in Prussia for instance, the institutions which compel every able-bodied man to serve for several years in the army, at a time of life at which imprudent marriages generally take place, are considered a full equivalent, in effect on population, for the legal restrictions of the other states; and the same remarks apply also, I believe, to the military system of France. The consequence of this is, that the population of those countries increase in no greater degree, probably, than does the produce from the land, both being pretty nearly at a standstill, apparently, or progressing but slowly. But it is quite certain that such an interference with the social liberty of the subject as I have here referred to, with a view to restrain the growth of our rapidly increasing population, would not be tolerated in this country for a moment; and, consequently, the land question becomes of the most vital consequence to us. Mill observes, in his great work on the "Principles of Political Economy," that, "whenever population is not kept down by the prudence either of individuals or of the state, it is kept down by starvation or disease." No more striking example of the truth of this statement can be afforded than in the case of Ireland, where, as we all know, the population went on increasing without restraint, the land became subdivided between the increasing families, and one of the most terrible famines on record was the result. My principal reason for referring to this, however, is to point out the fact that, where the subdivision of the land is carried out to a great extent, and no impediment exists to the natural increase of the population, the state must, and do interfere and lay down certain rules regulating the occupation of the land; and I feel convinced

that at no distant day a land bill will become as necessary in England, as the noble measure of justice, which has become law this year, was found to be necessary for Ireland. Having shown how momentous a matter is the question of the land occupation in this country, I shall now call your attention to the condition of the occupiers of small farms, both as proprietors and as tenants, with the state of the agricultural labourers in large farm districts; and I am happy to find that a great deal of most valuable information has been collected by the royal commissioners on the employment of children, young persons, and women in agriculture, which throws considerable light on this part of our subject, and to which I must allude. I will first refer to Mr. H. Tremenhare's report on the counties of Cumberland and Westmoreland, where there is a predominance of small farms, and farmed, too, by the owners themselves, known in these counties from time immemorial as statesmen or estatesmen. The assistant commissioner says of them that, "excepting on the land of some of the larger proprietors, the farming of the statesmen is generally bad. There is little spirit of improvement in the class. If they possess a little money they prefer hoarding it in their oaken chests to laying it out on the land. 'Would you not,' was inquired of an old statesman, 'expend a shilling on your property if it would eventually return you five shillings?' 'No: I would rather button it up in my breeches' pocket; it would be safer there,' was the reply. The roads leading to their homesteads are generally so bad, that it has been said that the only safe mode of reaching them would be by a balloon. The midden or dung-pile is close to the door of the dwelling-house; the land, generally undrained, is prolific of rushes, and the whole appearance of the property denotes poverty, slovenliness, and neglect. Bailey and Culley, when they visited Cumberland, early in the present century, were struck with the impoverished condition of the small statesman, and the condemnation then pronounced on their management I have seen nothing to induce me to consider as inapplicable to the present day: "These men," they say, "seem to inherit with the estates of their ancestors their notions of cultivating them, and are almost as much attached to the one as to the other." "I heard," continues the assistant commissioner, "of several of the smaller statesmen who, finding it impossible with their limited capital to make a living out of their land, sold it and became tenants of the very farm which as owners they had vainly endeavoured to cultivate with profit. In one case a small statesman who had become embarrassed sold his property to a neighbour, who took the estate into his own hands, and employed the former proprietor as his hind; and in a very short time the land, under improved management, was made to yield double its former produce. At best these small proprietors have to struggle hard for a subsistence, and small statesmen of from £50 to £70 a year are obliged to work harder and longer than any labourer would consent to do for the highest wages that could be offered to him." Mr. Tremenhare then goes on to speak of the state of the children of those proprietors; "the effect," he says, "of these small properties on the children of their owners is not favourable, for they are often kept from school for months to assist in the work of the farm. On inquiring of one at what age his children began to assist in the farm work," "as soon as they could crawl" was the reply; and I believe I am correct in stating that as a rule, the children of the smaller proprietors feel the disadvantages of a neglected education through life, and do not prosper in the world so well as those of agricultural labourers." And he concludes that, "If it is important that the soil should be cultivated with the maximum effect the small statesmen of these counties certainly do not satisfy that desideratum; half shepherds, half husbandmen, they are deficient in the spirit and enterprise which agriculture requires, and they are without either capital or skill. In the districts where tillage prevails they are singularly out of place. In small sheep and dairy farms they have a more legitimate occupation, and they will probably linger long in the secluded mountain dales, a remnant of that community of small proprietors, whose simple manners and sturdy independence have long given to this part of England one of its most marked characteristics." I have not hesitated to give this extract from the reports of the royal commissioners, because the information was so recently collected by the assistant commissioner on the spot, and doubtless under a due sense of the responsibility that was attached to the important office he filled.

You will not fail to notice that these statesmen of Cumberland and Westmoreland are the proprietors as well as occupiers of the land, the very position that is considered by the advocates of the small-farm system, to be most favourable to its success. But the most conclusive evidence against the system is the fact that the number of small holdings is rapidly diminishing, and have been continually diminishing for many years past; if the small farm system was at all successful or advantageous to the community, it is quite certain that the number of small farms would increase instead of diminish. But the real fact of the matter is that the profession of small farming does not generally answer in practice in this country, and the occupiers, whether they are the owners also, or not, have found it much more to their interest to work as ordinary farm labourers for regular weekly wages, than continue in the occupation of such small farms as those of ten or twenty acres in extent. I might give you abundant evidence of the truth of this statement from all parts of the country; thus, at Burbage, in Wilts, Mr. C. G. Bolam, agent to Lord Ailesbury, stated to one of the assistant commissioners that "there are a number of small accommodation holdings of from 2 or 3 to 20 and 30 acres at Burbage. The land being very rich and productive, the tenants are enabled to raise good crops at a comparatively small outlay. They pay an accommodation rent for these lands, and make a livelihood by growing vegetables, seed, &c., and making milk and butter for the markets. They are, as a body, almost worse off than many of the labourers; their capital is small; their work very fitful, at times very hard, at others very slack. The result of these intervals of comparative ease is too often the formation of vicious habits, and their want of education and training prevents them from profiting by the start beyond the ordinary farm labourer." This view is also confirmed by the vicar of Burbage, Archdeacon Stanton, who says of these men that "he does not think that they are as well off as many who work regularly as day-labourers. If they get an unusually good crop they become extravagant; they don't save; and suffer from want during the winter when no work is to be had." The commission found also an universal concurrence of opinion that the state of education among small farmers was even worse than among the ordinary farm labourers. Thus, if we go into Devonshire we find it stated that "the children in the Union are better educated than many farmers' sons. The will for education is not wanting among the farmers, but they have no capital, and are obliged to keep their lads at home to work on the farm." Again, at Heckfield, in Hants, it is stated "that the children of small farmers are worse off for education than those of labourers." If we turn again to Wales, the same features present themselves; thus the commissioners state that "the system of small farms (of from 10 to 50 acres), in its bearing upon the best interests of the occupier, his children, and the community at large, receives much illustration in the evidence relating to it in Wales. "There can be no doubt," the report continues, "that in Wales, as in England, according to the evidence, the small farmer lives harder, employs his children earlier, and gives them less education than the ordinary agricultural labourer. And in regard to the result of small farms on the produce of the land, the evidence entirely confirms the opinion expressed by Mr. Culley in a former report, that 'it is impossible for agriculture to make any decided advance in a district where the holdings are so small as to make it unprofitable for the occupier to employ the ordinary mechanical aids which increase the produce of the farm at the same time that they lessen the cost of production.' The agent to the Earl of Cawdor winds up his evidence by declaring that if the landowners of Wales do not merge their small holdings and make them more attractive to men of capital and enterprise, *"the country must remain as at present, very little advanced from a state of nature as regards farming"*. And Mr. Boyle, writing of Monmouthshire, says, "it sounds very well at first, that every labourer should have his own little holding, but it too often ends in his only making use of it to borrow money which he can never repay." Now, I believe the evidence which I have given, and which is only a very small portion of what I have collected, all to the same effect, embodies the opinions of every practical farmer in the kingdom; but I have preferred giving the opinions of those who are prosecuting, under the direction of the State, a most important inquiry on matters relating to the agricultural interest, and who could not possibly have the least bias on

this question. In the large farm districts we are met with the fact that, a large increase has taken place during the last 25 or 30 years in the rate of wages; thus in Wiltshire, Messrs. Rawlence and Squarey give it as their opinion that the wages of young unmarried men have increased about 40 per cent., and those of older men about 10 or 12: the difference being attributed to the fact that married men are less disposed to move than unmarried men, and are content with a smaller sum as an inducement to remain in one place. If we turn again to another part of the country, we find that Mr. Stanhope ascertained in the northern part of the great wold district of Lincolnshire, where the farms run mostly from 800 to 1,000 acres and upwards in extent, that "the work is plentiful and certain, and the wages high, and the labourers having this are not inclined to leave the place." Their wives he says "are too well off to work." These facts may be allowed to speak for themselves, I think; but as a rule, under our system of large farms, it is beyond a doubt the fact that, a good, honest, and industrious labourer seldom or never wants for work at good wages. Before I have done with the state of the labourers, however, I may perhaps mention that, in a letter to me some two or three years ago, Mr. J. S. Mill referred to the exorbitant price which the agricultural labourer had to pay for many of the necessities of life in country villages, "a thralldom from which," he said, "only co-operative stores could relieve him." I can hardly go into the question of co-operative societies here, and of the difficulties, insuperable I think, which would attend their introduction into agricultural districts; but I may mention the course which has been successfully pursued in this matter by a Wiltshire farmer, who farms between 1,500 and 2,000 acres of land. He found when he entered on his farm that his labourers were paying considerably more than they ought for almost every article of consumption which they required; he therefore determined upon purchasing these things at the wholesale rate himself, and he placed a reliable person to sell it to his workpeople at a price that just cleared the original cost and expenses, and they are highly pleased with the change, which has proved a very great advantage to them; it has no affinity to the truck system, as the labourers are all paid their wages in money; but they are only too glad to get their wants supplied at the reduced price at which they are offered to them at the shop provided by their master. It will be seen, therefore, that a remedy for the exorbitant prices which the agricultural labourers are charged for things in some districts, can be provided by large farmers following the example I have given, which the small farmer could not do. In fact, the small farmer takes little or no interest in the condition of the labourers, for he only occasionally employs them at all. I now approach another most important part of our subject, viz., the advantages which the large farm system is, and has been, to the country generally. Here, again, the evidence is almost wholly in favour of large farms. Where can we find, in any part of the kingdom, any considerable quantity of naturally poor land brought into a state of fertility but by large farmers, men of capital and enterprise? These are the men who, by the aid of the best mechanical appliances, have accomplished this, and created quite a revolution in British agriculture, principally by the large use of artificial food and manures, aids which the small farmer, I believe, avails himself but very little of. When driving through a part of South Wiltshire lately, I passed through a large farm where two powerful steam engines were at work with the cultivator, and smashing up the stubbles in beautiful style; the very next farm was in a most discreditable state, and, on my enquiring of a friend the cause of this, his reply was, that "it was a small farm, and the occupier had not the means to do it;" it was some of the best land, however, but the result was as I have just stated. And I believe, as a rule, this is the general experience with small farms, especially in tillage, and particularly where the land is not *naturally* fertile: in such districts the evidence is conclusive, that only by men of capital, or (I must add since the meeting of the Royal Agricultural Society this year at Oxford) ladies of capital, can such land be successfully farmed. The power which the large farmer can bring to bear on any of the operations of the farm is an immense advantage. The fickleness of the climate, too, in this country gives a great advantage to the large farmer, who, by concentrating his power, can take advantage of the most favourable opportunity to perform, in an expeditious manner,

the most important operations in agriculture. All in this assembly are aware of the success which has attended the introduction of steam-power as applied to the cultivation of our clay soils in different parts of the country, one of the latest and most successful examples of which is that of Mr. John Prout, at Sawbridgeworth, an interesting account of whose proceedings lately appeared in the *Times*. Now I hold it to be quite impossible for steam cultivation to be used successfully under the small farm system; this, I believe, no practical man will be found to deny. But it is asserted by the advocates of the small farm system, who, it is perhaps needless to say, are not practical farmers, "that machinery may be hired round by co-operative freeholders with more economy than if employed for only on a single farm." My answer to this is, that while the machinery was travelling about from one farm to another, and taking it up and setting it down, the whole work might be done on a large farm by the farmer who has the machinery and the labour at hand to work it. There are many other points well worth referring to under this part of our subject, but, in order to bring the length of this paper within proper limits, I must leave them for the members of this Club to deal with in the subsequent discussion, where they will be sure to be brought out with much greater effect. I have merely touched upon those points that appeared to me of the greatest consideration, and for you to enlarge more fully upon. But, gentlemen, I must confess to you that, in pursuing my inquiries into the merits of the two systems of large and small farming, I much regret that I have been compelled to say so little in favour of the system of small farms. I wish it to be particularly remembered, however, that I have been hitherto treating of the question from its general aspect; but there is no rule without an exception, and I am now about to speak of an exception to the rule. The impossibility of an industrious and thrifty labourer rising to the position of a farmer has been referred to as against the system of large farms; and I am quite sure that no large farmer can be found who would not be most happy to see the agricultural labourer raise himself to that position if by doing so he would benefit his condition. But he could not hope to obtain that position unless he had the opportunity of doing so by entering on small farms at the outset. There is, however, the plan of letting plots of land, that is suitable for the purpose, to the most careful and industrious of labouring families, for the purpose of keeping a cow or two, a plan that has answered well in many places, and which I have no hesitation in commending; for, besides the advantage it gives the labourer of improving his position, I know that one or two cows kept properly by themselves will yield more milk than if they were in a herd of 40 or 50 cows; and the system, as I just said, has been found to answer very well in practice. But this has not been the case where a man with two or three cows has been tempted to do nothing else; thus, in Derbyshire, Mr. Cottingham, agent to the Duke of Devonshire, says that "a man with an allotment of, say 10 acres, to keep a couple of cows, is better off than the holder of 20 or 30 acres or a farm just big enough to tempt him to do nothing but work on the farm. I reduced one man," he said, "to 10 acres from 20, to compel him to work; and he afterwards told me I had made a gentleman of him." I could give a great deal more evidence of a similar character; but to sum up this matter, I fully endorse the statement of Mr. Culley, to whom I have before referred, "that where a farm or allotment of five or six acres is of such a character as to enable a man to keep one or two cows without withdrawing him from his legitimate occupation as a farm labourer, there is the same evidence in Wales as he found in Derbyshire, that the charge of the little dairy is a much better occupation for his wife than ordinary field-work, or, indeed, than any other work he had seen labourers' wives engaged in." Of course, in commending this system, I am assuming that the cows are managed by the most careful and thrifty persons. To suppose that it would be successfully carried on by the *generality* of our labouring families would be a very great mistake indeed. But under our *laissez faire* or non-interference principle farms of all sizes will not be wanting, and I hold that there is no necessity in this country to depart from this rule, as the question of the size of farms has satisfactorily regulated itself to the present time, according to the requirements of the community. You will have observed that I have been hitherto speaking of the two systems of large and small farming; but by far the greater number of tenant

farmers in this country are in the occupation of comparatively small or moderate-sized farms, and it is to these I now wish shortly to direct your attention. But I am sorry that I cannot give you as much official data respecting the numbers of the occupiers of different classes of farms as I could wish; the official statistics do not afford the desired information, nor, indeed, as much as they might very easily afford: they give, however, the average extent of land returned by each occupier in England as about sixty acres. But the returns are probably from every one that keeps a pig or a horse, as well as from market gardeners, &c., and therefore we can only approximately arrive at the average size of farms in this country; but I think we shall be correct in assuming that the great bulk of tenant farmers are in the occupation of only small or moderate-sized farms, as in Ireland the greater number are in the occupation of only small plots of land. I have already shown the great advantage which the large farmer has over the small one in carrying out the different operations of the farm. This advantage he possesses over the moderate-sized farmer, but in a less degree; the one who can afford to employ the best mechanical aids, and having sufficient labourers to properly apportion over the different branches of farming operations, and so to bring the whole into a regular working system, is in the best position to develop to the fullest extent the resources of the soil. But I must not be understood to say that moderate-sized farmers cannot farm successfully; we have abundant evidence that by the exercise of the greatest industry and zeal this is done, yet his position at the present time is most unsatisfactory. But it is not from a lack of mechanical aids, or from any inability to perform in a proper manner the ordinary operations of the farm, that the position of farmers occupying comparatively small or moderate-sized farms is rapidly becoming intolerable; it is arising from an excessive competition for land, precisely the same cause that brought the Irish land question to a crisis, and, I believe, will inevitably bring the land question to a crisis in this country also, if nothing is done in time to counteract the evil effects of it. I consider the land question in England at the present moment may be fairly represented in this way: The occupier of a farm of such a size as to require from £8,000 to £10,000 of capital to work it, may be said to be on the whole in a position to take care of himself; that is to say, there is no necessity at present for the Legislature to interfere in his behalf; the occupier of a farm that requires from £3,000 to £5,000 of capital, would, from the greater demand there is for such farms, give somewhat more than the real value of it rather than leave it for the chance of getting another such a holding; the occupiers of farms that require but from £1,000 to £2,000 of capital—these being the most numerous, as I have said, and the class I am now directing your especial attention to—would submit to any extortion almost, rather than leave their farm, as there are 30 or 40 applicants, as a rule, for every farm of this size that comes into the market, and a tenant leaving would have but the thirtieth or fortieth part of a chance of getting another such a holding. I am assuming, of course, that the land is really useful land and not unduly encumbered with game, or other serious drawback attached to it. Now, this is a state of things which some of the owners of these moderate-sized farms are not slow to take advantage of; in some cases, to my knowledge, the most undue advantage, I am sorry to say, has been taken of the occupiers of these comparatively small-sized farms, solely in consequence of the extreme competition that at present exists for such holdings. But why farms should be of more *real* value, solely because farmers multiply and must live, and farms do not multiply, I am at a loss to understand. In the county of Somersetshire, where the moderate-sized farms to which I am now referring largely prevail, the competition is something enormous, and we are beginning to hear of the loathsome system of offering bribes to agents to get farms, and in one case, that has recently cropped up, an agent is greatly belied if he didn't accept a bribe of £100 from an in-going tenant, for whom he got the farm, and that too, with the owner's knowledge. Judge Longfield, in his essay on the Land Tenure of Ireland, says that the highest offers for farms "will be generally made by the poorest farmers," and also that "the real grievance was that the rent was so high as to reduce the tenant to indolent apathetic despair." Now, I fear that on some estates in Somersetshire the tenants are being almost driven to the same state. A case has lately come under my own knowledge, upon undoubted authority, which I trust you will permit me to

mention. The owner, or the solicitor rather, of an estate in five farms, and occupied by five tenants, at a rental of over £2,500 a-year in the aggregate, determined to raise the rents again last year: they had been raised about 15 per cent. not many years before, and the mode of proceeding adopted was this; a tenant was served on the 24th of March with a notice to quit at the Michaelmas following. But he was told that he was merely served for the purpose of an increase of rent; but what this increase was to be he was not told, nor could he ascertain till two or three out of the six months' notice had expired, and the opportunity of taking another farm was lost, when he was informed that the rise this time was *only* to be 7½ per cent.—and this he was obliged to submit to or leave. Having no chance of taking another suitable farm, he submitted, as did the other four tenants also. But this year one of these five tenants has succeeded in getting another farm; a second has tried to do the same; the third has died; the fourth has been lately taken to a lunatic-asylum; and the fifth declares that he would not remain but for special reasons, which I need not refer to. All these five tenants have, I am told, been in the occupation of their farms, with their relatives before them, for a half century each. The only excuse put forward for increasing the rents in this case was the necessities of the owner; the question of the *value* of the farms was not considered at all. Now will anyone tell me that such acts as these will tend to the ultimate advantage of the landowners in this country? I think not; and if land-courts were to be established in England (as they are about to be in Ireland), where tenants may appeal in cases of extortion and injustice, I believe it would be one of the most conservative measures that could be passed. I am perfectly well aware that the great proportion of the land in this country is held by just and generous landlords; they have nothing to fear from the passing into law of an act that shall enforce throughout the country something like their own fair and just dealings; but they have everything to fear from extortionate landowners, or unscrupulous lawyers, who may have the management of large estates that have, through losses in the betting-ring probably, become heavily encumbered. These are the persons who will bring the land-question to a crisis in this country. Nor is it necessary that cases of hardship should become general before it would be the duty of the legislature to interfere. His Grace the Duke of Richmond, in his speech on the second reading of the Irish Land Bill, said that "In the case of any body of people, however small, having injury inflicted upon them, he considered it to be the duty of Parliament to endeavour to find some remedy for it." I consider that it is to the eternal disgrace of the different governments of this country that the people of Ireland had to pass through the horrors of a famine, and were brought to the verge of a revolution before the land-question was honestly taken in hand and justice done to it; with our reformed Parliament let us hope that no Government will be permitted to exist that will allow it to come to such a pass in this country before applying a remedy. I do not for one moment dispute the fact that landlords have at present the legal right to exact the utmost farthing of rent that they possibly can for their land in England; but I deny the justice or the prudence of their doing so, for it will inevitably create—as, indeed, it has already created on many estates—a discontented body of tenantry. The competition principle has had the fullest latitude in Ireland, the custom of payment for good-will which there prevails being essentially a commercial transaction, governed by supply and demand; but whether it is paid in good-will or in the shape of rent matters nothing. We have seen the result of all this in Ireland, and it needs no prophet to foretell that the same cause, if allowed full scope, will lead to the same result in England. Let us hope that this will not be the case; but that a wise legislature will see the danger in time and apply the remedy, which will assuredly increase that good feeling that is so much to be desired between the owners and the occupiers of the soil of this country, and be for the lasting advantage of both classes, and of the greatest possible benefit to the teeming millions who inhabit this great nation.

Mr. C. S. READ, M.P., said he went fully with Mr. Trask on some points of the Irish Land Bill; but there was such a thing as doing justice to the tenant, at the expense of the landlord; and he believed that the Irish Land Bill had not exactly drawn the line in the way that English

tenant-farmers would have done if they had been consulted about the matter (Hear, hear). He was glad that the introducers of the subject had not gone very much into foreign farming. He had been rather afraid that they would be overdosed with that topic. He considered that the question of continental farming, as regarded its applicability to England, was entirely exhausted by the able paper of Mr. Howard, the chairman of the year, some time ago, and by the admirable article which appeared in the first number of the Royal Agricultural Society's *Journal* for this year. If they took the case of France, they found that the average production of wheat per acre was barely half what was grown in England, and only just what Mr. Lawes's unmanured plot had yielded for five-and-twenty years. That, he thought, dismissed the case of France, which had sometimes been held up as an example for this country to follow. On the other hand, if they took the evidence of Mr. Jenkins and Professor Voelcker, they found that, with all the ingenuity and all the saving of an intelligent people like the inhabitants of Belgium, the earnings of small farmers were somewhat less than those of our own agricultural labourers (Hear, hear). He maintained, therefore, that the example of France and Belgium ought not to be followed in this country. He thought that it might be laid down as a principle that some districts were specially adapted for large farms, and other districts for small ones (Hear, hear); but he had never yet seen the district which should be all large farms, or the one which should be all small farms (Hear, hear). In his opinion there should always be, even in a county like Norfolk, where the soil was naturally light and porous, and fitted for arable cultivation, and could only be profitably farmed—he did not know, indeed, how farming could now be carried on profitably anywhere (Hear, hear)—through the application of a considerable amount of capital to cultivation; he said that even there there ought to be a few small farms, by which a struggling persevering man might rise above the condition of a farm-labourer. They all knew that there were people in the world who by saving and toil, and intelligence would be almost sure to rise if they had a chance, and on no account should the first stave of the ladder be taken from them (Hear, hear). As he had before remarked in that room, the small farmer who really flourished was a man who would do the work of two labourers, and live at the expense of one (Hear, hear). If they went through a county like Norfolk, or any other where there were large arable farms, he ventured to say the moment they came to a village where there was a whole lot of small farms, they would at once see a difference in the cultivation. Moreover, agricultural labourers were better paid and more constantly employed on large farms than they could possibly be on small ones. There were, however, some articles of produce which were particularly suited for small farms and just now were particularly remunerative; and, looking at the price of milk, butter, eggs, and poultry, he must say that in his opinion they could be produced cheaper and better upon small farms than upon large ones. Therefore, he said, there was room both for large and for small farmers, and, even in a county where the soil was naturally light, he should be very sorry indeed to see the small occupier obliterated from the face of the earth.

Mr. G. SMYTHIES (Marlow Lodge, Leintwardine) said: Coming as he did from a district where there were a great many small freeholds, he wished to state the result of his experience with regard to small farms. In the adjoining county to his, in the county of Radnor, almost the whole of the land was divided into small freeholds, which were, for the most part, let by the owners, who rented large farms in neighbouring counties, thereby showing their appreciation of the difference between a large and a small occupation. Those persons did not, as a rule, make anything like good landlords; on the contrary, although they were tenant-farmers themselves in other counties, they did not seem to appreciate the difficulties which tenants had to contend with, and, for the most part, they were hard landlords. The occupiers of small farms were inferior employers of labourers and others, because they only wanted labourers at periods of the year when they could get abundance of work. They employed labourers, if they could get them, in summer and in harvest; but all the rest of the year, when it might be a boon to employ them, they discarded labourers altogether. Further, both the owners and occupiers of these

small freeholds were very inferior to large owners and occupiers as regarded subscriptions for the repairs of a church, the building of a school, or any other public work which was required in the neighbourhood. He could corroborate the statement of Mr. Trask, that, as a rule, the children of those small occupiers were worse educated than the children of labourers, being employed on the farm as soon as they were able to do any work. If such farmers had by accident any good stock of calves or lambs they were almost entirely indebted for it to their neighbours, being quite unable to purchase male animals of the best kind. He agreed, however, with Mr. Read, that it was desirable that a man who was able to push his way should be able to obtain a small farm, but he did not know any other recommendation that the small farm system had. The experience of which he had spoken was obtained in Herefordshire. He formerly lived in Lancashire, and in that case the opinion which he had expressed did not apply. There the small farms were, in fact, market gardens for the sale of produce which could not be supplied in any other way, and therefore small farms were extremely valuable. Indeed he did not see any objection to the whole of that country being divided into small farms. He did not think large farmers had any business there, and he must say that he felt out of his element. It would not do, he thought, to lay down any hard-and-fast line; but, on the other hand, although there were some counties where small farms would do well, taking a view of the whole country they seemed to be very objectionable (Hear, hear).

Mr. C. PAGET (Buddington, Nottinghamshire) said he had not the slightest intention of speaking on that subject when he entered the room. He had read many good papers which were delivered before the Farmers' Club; being in London he determined to hear the discussion on that subject; and he would now make a few remarks which were not at all prepared. He had been struck with the truth of the observation that between different localities there might with advantage be differences as regarded the size of farms. He lived in a district which was something like half-way between the east and the west, which were represented by the reader of the paper and by the gentleman who had just sat down—a district which bordered on the one side on land which must consist of large farms, if it were to be occupied profitably, and on the other on land which might be usefully occupied in dairy farms—and his experience tended to contradict some of the observations which were made by both those gentlemen. In the first place he must say that the small farmers of the village in which he lived were cultivating their land as well—he knew that he was speaking in the presence of very good farmers—as any farmer in England. The soil was free from twitch; it yielded from six to seven quarters of wheat per acre and from twenty-four to forty tons per acre of mangel-wurzel; and yet it was occupied by men who rented only from ten or fifteen up to fifty acres. He had on his estates five tenants who had all been labouring men—some of them on his own farm. They had been saving men, and having begun with a small farm they had added to their means, until the poorest man among them must be well worth £500. No doubt that resulted in a great measure from the character of the land, which was partly arable land and partly very good grass land. He had nineteen tenants, who had on the average thirteen acres a-piece, and not one of them—he would call Mr. Read's special attention to this fact—not one of them worked as a labourer on another farm. Formerly the system existed of letting to labourers a small lot of land in order that they might keep a cow; but farmers were most unwilling to employ them, and consequently the result was unsatisfactory. The time when farmers most wanted them was that at which they most required to work for themselves. In place of such persons there was now a class of men who had a small piece of arable land, and, what was most essential, there was attached to it a piece of grass-land. That system worked exceedingly well, and the difficulties to which he had alluded did not arise. Perhaps one or two of the number would keep horses instead of cows, and do the horse-work for their neighbours for hire, and that was found a convenient arrangement. The cattle had very much improved in consequence of the combination with arable land of a certain amount of grass-land, the effect being that there was a sufficient amount of roots and straw to carry them through the winter. When he first began to direct his atten-

tion to farming matters, now nearly fifty years ago, he had twelve to fifteen neighbours who were yeomen farmers, that is, men occupying their own land; but they very soon discovered that whereas they could only get 3 per cent. for their land in the shape of rent, they could obtain 10 per cent. as a return for capital, and the consequence was that one after another sold their land, and they had now become considerable farmers. One man, for example, had land consisting of 70 or 80 acres, which he sold for about £6,000. He afterwards took a farm of 600 acres, and became one of the first farmers in the district. In that way such small properties had been disposed of, with very great advantage to small occupiers and to the country at large. The owners of such properties were not in a position to effect the requisite improvements, and he had no hesitation in saying that, since the land was purchased by large proprietors its value had been increased 50 per cent. by means of improvements. He spent a large portion of the last ten years in Hungary, and notwithstanding Mr. Read's deprecation of any allusion to foreign cultivation, he wished to say a word or two in reference to what he had learnt there. Under the former system of holding the owner did not pay any money for the work which was done on his land, but he got as much as if he did receive it, the tenants working for him with their ploughs, their oxen, and their own hands, and doing a specified amount of work. There were disturbances in the country under that system, and in consequence the government declared that every tenant should be the owner of the land without performing any duties whatever. The effect of that was that these men, almost all, ceased to work at all. They formed drinking habits, and it was not till a considerable number of them had absolutely sold their properties to those among them who were saving and thriving that there was any considerable amount of produce obtained from the land. What he wished to call special attention to was the effect of that state of things on labourers. The owners had no capital to employ labourers during the winter months, and the consequence was that the labourers mortgaged their next year's work to Jews or usurers for half its value. They never had a harvest, and they were in a state of very great misery. He hoped, therefore, that they would never see adopted in England a system of having very small proprietors occupying land all over the country; while, on the other hand, he thought that, if a number of tenants had small plots of land which were highly improved by the landlord, they would prove a great advantage to the country.

Mr. MECHI (Titree) said, the object of that discussion seemed to be to show what sized farms were the best; but, in his opinion, they might as well attempt to decide whether it was best that there should be large manufactories or small ones, large traders or small traders (Hear, hear). The question was one of capital. Seventy years ago this kingdom comprised 10 millions of people with 45 million acres of land, a large proportion of which was in a comparatively primitive state as regards cultivation. Now the population was 30 millions, and agriculture was in an entirely different position from which it was at the beginning of the century in consequence of the employment of steam power, increased facilities for communication, and other improvements. But, notwithstanding all these improvements, it was still true that capital was created, as it always had been, by mental and physical superiority, and that with the accompaniments of care and frugality, individuals would be enabled to rise from the lowest ranks to a comparatively high position. That applied just as much to farming as to trade, and therefore it would be quite wrong to recommend any particular size of farms as preferable to any other size; such things regulated themselves, and ought not to be subject to Acts of Parliament. Men connected with agriculture, who possessed brains, and whose conduct was marked by frugality and economy, must in many cases rise and become large farmers. No doubt landowners having large estates would generally prefer having large farms. The question was, how much capital per acre a man could employ in the land? They were not yet agreed as to what amount per acre should be employed. He thought that farms could never be too large if the occupier had got £20 an acre, and that they could never be too small if he had got that (laughter). At present the average amount of the tenant's capital was, he believed, only £5 an acre, so that there was a very large margin for improvement. There could be no doubt that the size of farms, whether they were large or small, should lend a due propor-

tion to the amount of acreable capital to be invested. He thought they would all gradually come to the conclusion that more capital should be employed per acre. It was impossible to walk into the great showyard at Islington without thinking that, with the enormous amount of machinery that has to be employed, and the great cost of artificial manures for the land, and of artificial food for cattle, it was necessary that a larger amount of capital should be generally employed, and in proportion as a conviction of this spread among landlords and tenants, the system of farming must undergo a change. Tenants could not be expected to make the requisite outlay for draining and building, and agriculturists must look to the steward, and those talented men who managed large estates, to enforce enlightened and advanced views of the duties of landlords as well as those of tenants. In the City of London he (Mr. Mechi) had seen many men rise from the little shop to the large warehouse, and he agreed with preceding speakers, that in agriculture as well as in trade there should always be an opening for industrious men. Let no one run away with the notion that that Club thought that the 45 millions of acres in this country should all be cut out, as it were, in such large slices, that there would be no room or opportunity for a man of small capital to rise (Hear, hear).

Mr. JOHN THOMAS (Bletsoe, Beds) said a great deal had been made of the discrepancies in the remarks made in that club, and perhaps that would be the case with regard to this discussion upon large and small farms. Mr. Smythies had told them in effect that in Herefordshire large farms were preferable to small ones, while other gentlemen had praised small farms. The truth appeared to be that in Nottinghamshire, Lancashire, and other counties where there was a very large town population, small farms answered very well, and that in other districts they were not good either for the landlord, occupier, or the labourer. When there was a superabundance of labour it was the large farmers who took it up, and as more capital was employed on such farms, the public derived some benefit from the extra outlay. He considered the Club much indebted to Mr. Trask for his able paper; and, for his own part, he entirely concurred in the views expressed by that gentleman.

Mr. J. WELLS (Booth Ferry House, Howden) said, having had considerable experience in landed pursuits for many years, he must say that it was an advantage in a national point of view as regarded the cheap production of food, that farms should generally be large. Small farms involved a number of small inclosures, with fences and ditches, and a consequent accumulation of weeds and rubbish, harbour for vermin, labour in dressing and cleaning, waste of ground, and prevention of that free current of air so advantageous to the crops when approaching maturity. He should be very sorry to see the time when small farmers would entirely cease to exist, or when a man of small means would not be able to rise in farming pursuits; but that was not a question affecting merely individual interests, it concerned the nation, and in a national point of view he was in favour of moderately large holdings. A great deal had been said about a labouring man having an opportunity of rising; but in his opinion the advantage to the labourer being employed all the year was equally important. In his system of farming he never allowed a man who worked for him in summer to want a day's labour in winter, and consequently he generally got through his harvest operations without extra men. He never went over any farm without finding something might be done in the way of cropping a hedge, carting off a ditch side or levelling, that would pay in the end, while in that way many a man was prevented from suffering with his family in winter. He was surprised to hear any one speak of an expenditure of capital yielding no return, and he could not help thinking that the case mentioned was quite exceptional. He had laid out large sums in the improvement of lands, but he never knew an instance, where the outlay had been judicious, that it had not ultimately proved remunerative.

Mr. HENRY NEILD (Lancashire) thought that in dealing with such a question as the size of farms they should always take into account the situation or position of the county where situated. It would be perfectly fallacious to lay down any rule or principle in that respect as if it were applicable to the whole country. In the north they had been taught that supply and demand regulated almost everything. In Lancashire and Cheshire improved machinery in cotton manufactures had provided at half the cost what was formerly supplied

by handloom weaving; and the principle involved in this question was similar. He believed that if the farming produce of Lancashire were compared with that of any other county it would be found to bear the comparison exceedingly well, and that was chiefly under a system of small farms. It was in his opinion desirable to have in this country a mixture of large and small farms. In Lancashire and Cheshire they could not do without small farms. The dairy produce to which Mr. Read had referred, butter, eggs, and poultry had there yielded a fair profit, and he thought it would be well if even many large farmers turned their attention to such matters, as it was rather a reflection upon English farmers that this country had to import so much dairy produce (Hear, hear). In the area of the Manchester and Liverpool agricultural societies they had a test by which they could find out who were the best cultivators, by a scale of prizes for root crops and cultivation. In a farm of 200 acres a certain proportion, perhaps quarter, ought to be under root cultivation, which was the foundation of agriculture. Small farms could be named that produced an astonishing quantity of roots, and this year there had been obtained as many as 40 tons per acre of mangold wurtzel. He thought no absolute rule could be laid down as regarded the size of farms. Different counties must be farmed according to their own circumstances, and if things were left to their natural course that would no doubt regulate the matter. In his opinion it would be a deplorable day for England if any legislation should interfere with the natural course of agriculture (cheers). No doubt there was a great deal in what had been said about some landlords taking advantage of competition, for farmers to act unjustly towards their tenants, and if such things went on, or were general, it might become necessary to introduce a bill into parliament; but he believed there was no danger of that, and for the honour of England's aristocracy he deprecated any legislation in such matters (cheers).

Mr. EDMUNDS (Rugby) said he had risen merely to ask the Farmers' Club whether they really thought for one moment that England required an Irish Land Bill? (Hear, hear.) He believed that no such absurdity was ever started (cheers). The Irish serfs were shooting down the landlords and land agents; agrarian outrages prevailed throughout the land, and under such circumstances it was necessary that there should be some legislation; but such legislation was not necessary in the case of a more civilised land. That was the only part of Mr. Trask's paper from which he dissented. As regarded the size of farms, he would ask, what did gentlemen mean by a small farm and what by a large one? They had been told that evening about the farming of plots of 13 acres. That was not farming, but spade cultivation (Hear, hear). He agreed with Mr. Read in deprecating allusions to the Continent. As to Flanders, he would ask whether our labourers would be satisfied with Flemish eating and Flemish drinking? (laughter.) It was impossible to carry out such a system here, and he for one had no wish to see in England a race of peasant proprietors, cultivating 15 or 20 acres of land. In Warwickshire the average size of farms was only from 200 to 250 acres, so that the occupations were comparatively small; but, depend upon it, that if, as regarded any part of the country, there were any attempts to interfere with free contract between man and man, that would be a great mistake. Fancy a person saying to a Warwickshire farmer: The Norfolk farmers occupy a thousand acres of land, and therefore you ought to occupy as many; and you must find the requisite capital! The less they had of centralisation or of government interference with the ordinary transactions between man and man the better (Hear, hear).

The REV. E. SMYTHIES (Hathern Rectory, Loughborough) said one point that had not been touched upon that evening appeared to him of vital importance; he meant that there were certain qualities of land which were very well adapted for small farms, and quite unsuited for large ones. He was surrounded in a strong-land district by men who cultivated 30, 40, or 50 acres of land on separate farms. What was the consequence? Why, that in cases in which four or even six horses were required, the occupier tried to manage with two. And on such a system the land got more and more foul year after year, until it could hardly be cultivated with profit any longer. On some light land, a man might do very well with two horses; while with the same amount of horse-power, strong-land could not possibly be kept clean. He fully en-

dorsed the principle laid down that evening that it would not do to stand by any hard-and-fast line; but he maintained that strong-land was utterly unsuitable for small farms. As regarded dairy-farms, no doubt men with a very small acreage could produce milk, butter, and even cheese with advantage; but he knew men on farms of a different kind, who laboured from early morning until night, and were only just able to pay their rent. In such matters they could not perhaps be guided entirely by rules of political economy; but if men who had saved a little money, wished to engage in farming, it would perhaps be better for a few of them to unite to take a farm of 200 or 250 acres instead of each having 50. He was perfectly well aware of the difficulty of getting men to work together for the purpose of cultivating the soil; but the proper course would be to elect a captain (Laughter).

Mr. W. BROWN (Tring) said, that if a vote were taken that evening they would probably all be unanimous on one point, namely, that no precise rule could be laid down as to the size of farms, each district depending in that respect on its own peculiarities (Hear, hear). There was another rule or principle by which, as a land agent, he had usually been guided. When a man applied to him for a farm, he would first of all ask him what was the size of his pocket; and in this way he was enabled to judge what sized-farm he should have (Hear, hear). With regard to competition for farms, he could bear out to a great extent what Mr. Trask had said on that subject. He had found that the larger farms were the less was the competition for them, and that when a farm consisted of from 150 to 200 acres there would be ten applicants for one in the case of a very large farm. The question of a proper supply of buildings had a very close connexion with that under consideration. The man who occupied only 80 acres of land wanted the same description of building-accommodation as the man whose farm was very much larger; and this being the case, there was much greater economy in leasing farms of 500 acres than farms of 100. The difference, in point of economy, extended indeed throughout all the operations of the farm. What applied first of all to the landlords supplying the requisite buildings, applied also to the tenants' keeping them in proper condition, and obtaining proper implements. Take the drill, for instance. They must all have a drill, but the quantity of capital required was diminished proportionately as the operations were extended. Therefore he maintained that it was of great importance that farms should be of such a size that capital could be applied and cultivation carried on in the most economical manner. Mr. Trask cited the evidence of the Duke of Devonshire's agent in reference to the case of small occupiers who kept a cow. He (Mr. Brown) could supplement that evidence from his own observation. Not only had the persons referred to a small quantity of land attached to their cottages but they had also each the privilege of turning one or two cows into the park for a payment of £3 a-year, and that arrangement was found to work advantageously.

Mr. T. OWEN (Clapton, Hungerford) said he entirely concurred in most of the excellent remarks of Mr. Trask, and particularly in the remark that large farms were schools for labourers; and in that respect, as well as others, had a great advantage over small ones. If a man took a farm of any considerable extent he wanted labourers of the best kind, the first thing he did being to look out for a good carter and a good shepherd; and small farms did not provide the sort of men which were required. He was an advocate for giving small farmers an opportunity of holding land if they had sufficient capital to do so; but he contended that moderately-large farms were most beneficial to the country, especially as great improvements were now essential not only in cultivation but also in the management of stock to enable farmers to compete with foreigners. He did not agree with the last speaker that when farms were to be let there were ten applicants for a small farm for one applicant for a large farm. He would ask that gentleman how often did a large farm come out of occupation as compared with a small one? His own experience showed that in the case of moderately-large farms the changes in that respect were fewer than in that of farms of smaller extent (Hear, hear).

Mr. T. B. DRING (Claxby, Spilsby) thought the discussion of that evening could not alter their opinion as to the necessity of having both small and large farms. When persons who had been brought up to farming, knowing perhaps very little else, the capital at their disposal varied very much in

amount, and they required a farm in proportion to the capital they possessed. Some had capital for a large farm and others only for a small one, and the two classes could not have occupations of the same extent. There could, in his opinion, be no doubt that a larger occupation was best for the public in general. He believed that, as a general rule farms of from 400 to 500 acres were best for the country; but it must be borne in mind that there were localities that were adapted for small farms, and other localities that were adapted for large ones. The other day he happened to be on an estate in Yorkshire which comprised about 13,000 acres, and that estate seemed to be adapted for small farms, consisting of 15, 20, 30, 40, and as high as 50 acres. The farms were so difficult to get at, that the land could not very well be cultivated on the large-farm system; the hills being so very steep that there must be such difficulty in getting machines and coals, and to thrash and get away the produce in such situations, he thought small farms the best. As regards the Norfolk district which was alluded to this evening by Mr. Read, he (Mr. Dring) happened last summer to have gone over a portion of it where the land was tolerably level, and he noticed that there were many small fields with a great number of hedges; and he also noticed that under the trees there were no turnips at all, and that the barley was only half a crop. He could not help thinking what an advantage it would be, both to the owner and the occupier, if those six-acre fields were converted into fields of 20 or 30 acres. In conclusion, he must say that he thought the size of farms would, after the discussion of that evening, remain pretty much as it was before (Hear, hear).

The CHAIRMAN, in summing up the discussion, said it occurred to him as Mr. Trask was reading his paper that there seemed to be three interests involved in the question before them, and he wished just to allude to them. He must, however, first remark that some of the speakers had erroneously assumed that the object that evening was to lay down some hard and fast rule with regard to the size of farms. The statement of the subject was, in fact, rather meagre, being simply "The size of farms." The committee adopted that form after full deliberation, not knowing exactly what line the discussion would take, and wishing simply to evoke the opinion and feeling of the Club-members as to what sized farms would most conduce to the general interest of the country (Hear, hear). Now, as he had just observed, it appeared to him that there are three interests primarily involved: first, the owner; then the occupier; and lastly, the labourer. The case of the owner was very well put by Mr. Brown when he said that a small farm required as many buildings as a large one; so that, in point of fact, a proprietor could scarcely afford to have a great many occupations, on account of the expense of buildings. He (the chairman) fully endorsed that view of the matter. The question whether or not large or small farms were most conducive to the interest of farmers was very well met by Mr. Mechi, when he said that it was a question of capital. Upon all large estates there must be holdings ranging from 50 to 1,000 acres. Then as regards labourers, he agreed with Mr. Thomas, when he said that large farms employed the greatest number of labourers. But there were certain localities that were more favourable for small farms than others. Some of them had been alluded to by some of the speakers, and he (the chairman) could, if time permitted, mention many localities where small farms were necessarily conducive to the interest of everybody connected with them. As regarded the observations of Mr. Paget about men farming their own estate, he remembered many years ago hearing a friend of his remark, that the man who farmed his own estate had a very bad landlord, and he believed that would generally prove to be the case. Mr. Paget referred to several cases within his knowledge in which small owners had sold their land, and become farmers instead of proprietors with great advantage to themselves, and those cases were in accordance with his own observations in such matters.

Mr. TRASK, in replying, expressed his satisfaction at finding 13 out of the 14 speakers who had taken part in the discussion had expressed themselves in favour of large farms as a rule. He had not supposed the Irish Land Bill was necessary in England, but that as our population increased some measure would become necessary, and if rents went on increasing as at present, with an insecure tenure, the capital employed in

agriculture would be far more likely to be reduced from £5 an acre to £4 than increase to £20, the sum Mr. Mechi considered desirable.

On the motion of Mr. MECHE, seconded by Mr. J. THOMAS, a vote of thanks was given to Mr. Trask for his introduction, and the proceedings terminated with thanks to the chairman.

THE FARMERS' CLUB DINNER.

The Annual Dinner of the Farmers' Club took place on Tuesday evening, December 6, at the Salisbury Hotel, Mr. Charles Howard presiding in the absence of the Chairman for the year Mr. James Howard, from indisposition. The Vice-Chair was occupied by the Chairman elect, Mr. Spearing, of Erleigh, Reading.

The CHAIRMAN gave "H.R.H. the Prince of Wales, the Princess of Wales, and the rest of the Royal Family." In proposing this the Chairman said that the Prince of Wales was very fond of field sports; but there was one class of sport which, if carried to excess, as it had been in the county of Norfolk, was highly prejudicial to agriculture, and he hoped His Royal Highness would be led to see the evils of that system (cheers).

The toast of "The Army, Navy, Militia, and Volunteers," was responded to by Captain Johnson, of the Sussex Militia.

The CHAIRMAN then said: Gentlemen, I have now to ask you to drink the toast of the evening, namely, "Success to the Farmers' Club, and thanks to those gentlemen who have read papers during the past year (cheers.)" The Central Farmers' Club ought to commend itself to the favourable consideration of all classes in this country. Its object is a truly national one. It was not established for the immediate benefit of its members, but for the advancement of agriculture throughout the kingdom. I am very glad indeed to find from the excellent Report just issued by the Committee that the Club is in a most satisfactory and flourishing condition. That report states that "the monthly discussion meetings of the Club have now extended over a period of 28 years, during which time there has scarcely been a subject either practically or politically affecting the position of the Farmer that has not received some consideration; while so far from any decline being observable, the Committee cannot but think that the interest and importance of these meetings have increased during the last few years" (cheers). There can be little doubt that the papers and discussions of this Club have commanded increased attention. Evidence of this is given in another part of the Report, which I will now proceed to read. "During the season fifty-five new members have been elected, and there are a number of names now down for the new year. It is satisfactory to see amongst these candidates gentlemen who in their places in the House of Commons are more or less identified with the interests of agriculture, so that there is a promise of the Club increasing its influence in this direction" (cheers). Well, gentlemen, I think it is pretty certain that members of the House of Commons would not join our Club unless they felt that by coming among us there was some useful knowledge to be obtained (Hear, hear). We are very pleased indeed to see such gentlemen among us; and I am quite sure we shall be very well satisfied if they will only discharge their debt for any wrinkles which they may gather here by showing their interest in agriculture in "another place" (Hear, hear). It seems to me very desirable that county members should mix frequently with those whom they represent: they would thus obtain information which cannot be derived in any other way. I know that in some parts of the country many of those gentlemen are scarcely seen from one canvas to another: they appear to be almost as shy of their constituents, to use a very homely phrase, as a cow is of a bastard calf (laughter). We are, I am sure, very much pleased to see several Members of Parliament here this evening; and those gentlemen having become members of this Club, I trust that many others will be induced to follow their example. It is satisfactory, gentlemen, to find that the noble pursuit which we follow is daily advancing in public estimation. Time was when hard names were applied to us, and when it was thought immaterial whether a sheaf of wheat was grown in this country. Those times are

gone by. People read and think more for themselves. The importance of agriculture is, therefore, becoming more and more recognised every day. I only wish that a very useful and excellent article which appeared a month ago in the *Mark Lane Express* could find its way to the pages of some of those periodicals which the better class of our artisans read throughout the country. The subject of it was the annual value of our agricultural produce; the facts stated being very startling indeed, and such as many persons in every class of society know very little about. The writer seems to have gone very deeply into the matter, and he shows that the annual value of the agricultural produce of this country is something like the enormous sum of £300,000,000, that is exclusive of milk, butter, cheese, straw, and horses. We must all have been struck on coming up to London a day or two ago to find in every newspaper, no matter what may be its political bias, an article upon the Cattle Show in connection with its bearing upon our food supplies. Gentlemen, that is a very important question, and one which we must face (Hear, hear). Warm defenders as we are of our present system of agriculture, we cannot shut our eyes to the fact that it might be very much better, and that a very much larger amount of capital might be beneficially employed in it. But is it likely, I ask, that men who have capital will embark it in the cultivation of much of the soil in this country while there is such an insecure tenure as we now possess? (Hear, hear.) There are quite as bad landlords in England as there have ever been in Ireland (Hear, hear). There are landowners here who tenaciously cling to feudal usages—whose tenants require quite as much protection as any on the other side of the Channel; and it is quite evident that if English agriculture is ever to assume the position which it ought to assume, a well-defined Tenant Right is imperative (cheers). It may be said that on the large territorial estates generally of this country nothing of that kind is required. True there is greater security on those estates than on others; but, gentlemen, a Pharaoh may arise who "knows not Joseph" (laughter), and great hardships may be endured in consequence (Hear, hear). I have to bring before your notice in connection with the toast the gentlemen who have been kind enough to read papers during the past year. One of those papers at least bore upon the point to which I have just drawn your attention; I allude to the valuable paper read by our excellent secretary, Mr. Corbet in May last; and only last evening, we had an interesting paper, involving the vexed question to which certain parties in this country look as a remedy for all our evils as a nation; I mean the question of cutting up all the land into small farms, the idea entertained by those to whom I allude being that if that were done, we should never hear anything about distress again (laughter). Gentlemen, I now call upon you to drink the toast (cheers).

The toast having been drunk with great cordiality, and the names of Mr. H. Corbet and Mr. Trask being associated with the toast,

Mr. CORBET said: Having to respond to a subsequent toast, and being strongly of opinion that a man ought not to speak more than once in the evening, he felt more inclined to read an extract from a speech than to make one himself. However, an old schoolfellow of his, having thrown overboard his Latin and Greek, went to Australia to engage in farming operations there. Having recently returned to this country he called upon him last summer, and showed him an Australian newspaper, containing something that appeared to him (Mr. Corbet) to be of interest to them. This was an address delivered before the Victorian Agricultural Society on "Rational Cultivation." In the course of his remarks the lecturer said: "First on the list of things that would tend to promote rational agriculture, I will venture to mention Farmers' Clubs, such as this Society has had the honour of introducing to the colony, or, as they might be called, farmers' schools for grown-up pupils, where each by turn is teacher and is taught. They are the most readily available and practicable means of agricultural education that we have at hand. These Clubs, and the national shows of the Royal and Highland Societies have done more to advance British agriculture to its present position of high excellence than anything else. They have taught the British farmer to think, and to express his thoughts. I can assure you, although you may not think it, I read with far more interest and profit the papers and discussions of some of those Farmers' Clubs in the old country than I do even the parliamentary de-

bates in our own. Through these Clubs, and the agency of the press in diffusing the knowledge gleaned at their meetings, and by that strength which such union gives, the British farmer is fast becoming a power in the state. Instead of being considered a mere cipher, and told now he was to vote at elections, he will ere long dictate to his landlords how they must vote in Parliament on such questions as the Game Laws and Tenant Right." Now he (Mr. Corbet) thought it must be very gratifying to them living in the old country to find their glory waited right and left across the sea—not the glory of England only, but the glory of the Farmers' Club (cheers). Especially gratifying was it to him to find the questions of Tenant Right and the game laws placed in such a prominent position. They had laboured earnestly and honestly on the question of Tenant Right for the last 30 years; he thoroughly believed that on that question farmers were becoming stronger and stronger; and having himself had the honour to introduce the subject for discussion in May last, he was much gratified to hear it referred to as it had been by the Chairman that evening. He was quite sure that there was no flag under which tenant farmers could fight better than under that of Tenant Right (cheers).

Mr. FRANK also returned thanks. He said he believed that many of the papers read before that Club had done a great deal of good and exercised very great influence. As a proof of the interest some of the authorities of the country had taken in the proceedings of that Club, he might mention that a Blue Book, which was presented to Her Majesty and the Houses of Parliament during the present year, having been printed "by Order," contained a report of a discussion which had taken place at that Club. That was, he thought, a great honour to the Club, as well as to the author of the paper, Mr. Trethewy, in which the discussion was introduced (cheers). In illustration of the increased interest which was manifested in the Farmers' Club reference had been made that evening to some new members. He was quite sure that the members of that Club generally were very glad to see enrolled in their body Members of Parliament who took special interest in agricultural subjects, and he only hoped that the Hon. Baronet the Member for Devon (Sir Massey Lopes), would be able to do something to adjust the local taxation of the country.

Mr. C. S. READ, M.P., then proposed "The Chairman—with better health to Mr. James Howard, M.P., the Chairman of the year." He said: We live in stirring times—we hear of "wars and rumours of wars;" and I am sure, gentlemen, you all joined in the devout hope of our chairman that this country may continue to be blessed with peace, and I would add that we must one and all pray that that horrible war which is now devastating France may shortly be brought to a close (cheers). We cannot, indeed, now look upon it as war, it is something like murder. Almost every one who now speaks in public about the war has a theory with regard to it. I have heard this theory advanced in order to account for the successes of the Germans over the French—that the physical superiority of the Germans is caused in a great manner by their having better military drill than the French. Now, as the French are constantly drilled, I should have imagined that the intermittent drill of the Germans is not quite as perfect as the French drill (Hear, hear). However, I am not a judge on that point. Another theory is that the German victories are owing to the superiority of their education; but if you examine the matter, you will find that the soldiers of German States which are not quite as highly educated as those of Prussia and Saxony are equally brave in the field. There are all sorts of theories and arguments on that subject, and, with your permission, I will give my theory. I believe that the superiority of the Germans consists in their being a beer-drinking people (laughter and cheers). I say it seriously—a sober, beer-drinking people (Hear, hear). Beer is their national beverage. They have no malt-tax; they have very little beer-tax. You can get all over Germany a cheap, refreshing glass of beer, and I contend that that is very much better than the sour wines of France, which purge the body and set the teeth on edge (laughter). I would follow up that thought by saying, how comes it to pass that our agricultural labourers are so degenerate in physical strength? They are better paid, they are better clothed, they are better housed than they were fifty years ago; but they cannot undergo the same amount of physical toil, and I say we must look to the drink for the cause. The milk has been exchanged for

wishy-washy tea (Hear, hear); the home-brewed that was doled out regularly from the farm-house, and the swipes that was brewed in the cottage, have been exchanged for horrible doctored publican's beer, supplemented now and then with a glass of poisonous gin (Hear, hear). It has been my fate on previous occasions like the present, not exactly to give an account of my stewardship, but to bring before you one or two of the main passages which the last session of Parliament has supplied with regard to agriculture. Now, I had hoped that our excellent President would have supplied my place on this occasion; and I am sure that we all deeply regret his unavoidable absence, and the unhappy cause of it (Hear, hear). I am sorry to say that the statement which I have to make will be a very short and a very poor one. The main portion of last session was taken up with the consideration of the Irish Land Bill—a bill which, though it was eulogised last night by one or two speakers, I believe is not the sort of bill which we should wish or hope will ever be passed for England (Hear, hear). The small tenant farmer of Ireland is not merely going to be paid for every sixpence that he has expended on the soil, but he has also created for him a special interest in the occupation of the land which, although it may in the first instance be to his profit, will, I am quite sure, in the end militate greatly against the interest of the tenantry of Ireland (Hear, hear). You can never do a wrong for one class but it must somehow or other eventually recoil upon that class. Another matter which I would mention is the gun-tax. That has been said to be a game-preserving Bill in disguise. Well now, in my opinion, it is a game-preserving Bill, pure and simple (cheers). I do not suppose any one can believe that such a wise and subtle man as Mr. Lowe for one moment thought that by imposing a ten-shilling tax he could prevent people from being murdered by revolvers or effectually suppress what he calls the too general use of fire-arms. Now, with the exception of one or two other matters, with which I will not trouble you, I believe the last session was, as regards practical agriculture almost a blank. Perhaps you will ask me how it was that there were so many blank sessions in Parliament as regards the agricultural interest. I would say, and I say it boldly, that it is just the same in the House of Commons as out of it. The agricultural interest is the most powerful interest in the kingdom; but it is not united, and it loses its cohesion when it comes to practical work (Hear, hear). We are the worst hands in the world at accepting extraneous help. I would ask whether the corn-laws would ever have been repealed if the agitators for their repeal had not been ready to receive help from any one who would grant it, without inquiring what were his politics? (Hear, hear). I say we are to blame in that respect. We are, moreover, constantly carping at what we call crochets, enthusiastic men. We should utilise their enthusiasm. Remember that the world has been conquered and governed by enthusiasts. Coming outside Parliament let me begin with the various agricultural societies. There we meet with a great number of most useful, practical, well-worked societies; and I believe that they are all wanted, and that each one in its different line and vocation is doing an immense deal of good. Certainly I for one should have liked to see some of the junior institutions of that kind grafted upon the older ones. Still there is sufficient room for all of them. But, then up starts one of our eloquent speakers or ready writers, and who seem constantly trying to create dissensions and divisions, which would not otherwise exist; and these, mind you are not outside enemies, but persons who profess to be among our best friends. That, therefore, is one of the reasons why it comes to pass that the agricultural interest outside Parliament is not thoroughly united. And then, just look for one moment at the case of individual farmers. Go into any country you like, and take a body of farmers. For five-and-twenty years they have been "hoping against hope." Ever since the corn-laws were repealed they have been promised this, that, and the other. Not a single promise has been redeemed, but instead of that increased taxation has been constantly imposed. So they grumble and do nothing. And then, if you do see a good, active, zealous man, you find that he is very apt indeed to fancy that his own locality represents the whole agriculture of the country. He makes a speech at his own Farmers' Club, and comes up here and lets off the steam, and then is dreadfully annoyed to find that other people don't think exactly as he does. I will exemplify that in my own case.

On the very last occasion that I made a speech in the House of Commons the noble lord the member for Retford (Lord Galway) was good enough to tell me that I considered Norfolk to be all England (laughter). Now, then, let us look at some of our acknowledged grievances, and see how they are generally treated by farmers and by our friends. First of all, take the malt-tax. What do our friends who are fond of wrapping us in wet blankets and dosing us with cold water say? "O it is possible to make better and perhaps a little cheaper beer;" but as to you farmers, you would be inundated with foreign barley, and would not have a better price for your grain if the tax were repealed." Again, take the case of the Game-laws. If you were to get some modification or alteration of those laws, our kind friends, say the landlords, will be in exactly the same position as at first, and will just keep as much game as they please. Then there is the great question of tenant-right. We are told that we farmers should certainly get no benefit, that we should have to pay for what we did not want and have greatly to increase the capital which we employ in the land. As regards county financial boards, some say, "You will have higher rates." Further, there is the question of local taxation. During the last five-and-twenty years the whole of the increased local taxation has been paid by the tenants—I say, most distinctly and emphatically, the whole of the increased local taxation on land has been paid by the tenants; and, then, you are told that if there be a modification or alteration, the whole of the benefit will be enjoyed by the landlords. Well, then, suppose you get a Minister of Agriculture, what will he do? "He will," it is said, "make statistics compulsory, and tax our farm horses." That is the kind of argument which you have at every market table, from some extraordinary individual it may be, but still he is, somehow or other, identified with the agricultural interest, and he may even be a tenant-farmer (laughter). It seems to me that we ought to try if we cannot put an end to that sort of thing; for it is because we have these schisms and divisions among ourselves that we do not make the progress that we ought to make. Well, then, look at agricultural meetings. If we go to one meeting and see a great many landlords at such meeting, we find some man starting up and exclaiming, "Undue landlord influence!" If we go to another meeting, and no landlords are present, we hear it said, "Landlords are not doing their duty, or taking a proper interest in agriculture!" (laughter.) You go to another meeting, perhaps, where the question of education was to be considered. The clergy, more than any other class, take a deep interest in the education of our agricultural labourers; yet, when they attend a meeting in any number, you are sure to hear the words, "Too much priestly influence." And then, when they have come to a real *bona fide* farmers' club like this, gentlemen go away and say—"Why these tenant-farmers seem, somehow or other, to forget that there is such a being as a landlord left." Let me just say this, gentlemen, in respect to our own Club—this is the greatest and best combination of practical farmers in the kingdom; but we have hitherto suffered a little through not having had a sufficient number of landlords to take an interest in our proceedings, and therefore I cordially join in the congratulation expressed in the report of the committee, that in the past year we have added considerably to our list of the number of landlords and gentlemen having seats in the House of Commons who are connected with the agricultural interest. Now, gentlemen, let me just draw a moral from what I have said: Don't let anyone say for a moment that any advantage which can be gained for agriculture can be appropriated exclusively either by the landlord, the tenant, or the labourer. It is impossible that it can be absorbed by one class. If it be a real benefit it will pervade the whole, although it is just possible that some one class may receive a larger percentage of benefit than others. And then, just let me add this—that there cannot be greater unity between landlord and tenant till they act together more than they have done. And I am quite sure that the more landlords and tenants know of each other—the oftener they meet, the more frequently they discuss differences—the greater respect they will entertain for each other, and the greater will be the amount of success, prosperity, and advancement attained by agriculture (cheers). Gentlemen, one part of my toast is "Better health to Mr. James Howard, M.P., the chairman of the year." Mr. Howard has done good service to the cause of farmers in Parliament (cheers). It is most

essential that the agricultural interest in Parliament should not belong to any particular party, were it so, we might have Liberal members to speak for us whenever agriculture is assailed. Mr. Howard stands up in the House of Commons on our behalf; he not only speaks, but speaks well; and the only time that I have seen any impatience manifested towards him was when he rather displeased some of his Liberal friends by upholding the tenant farmer, and they therefore endeavoured to stifle what he was saying. I am sure you all sympathise with his family in relation to his present indisposition, which has no doubt been brought on by overwork. There are some people who rust up. Mr. Howard is not a man of that sort; and I believe—I am sorry for it, for our sakes and for the sake of his family—he has been wearing himself out. Before sitting down I wish to say one word with regard to our excellent chairman. It is not often that so good a substitute can be found as we have the good-fortune to possess on the present occasion. If there be one man in the country whom I more respect than another that man is Charles Howard (cheers). If I wanted to place before the world a good specimen of an intelligent, honest, and truly Liberal John Bull, I should present our excellent chairman (renewed cheers). I believe that in every relation of life he is a pattern to us all, and I have great pleasure in including his health in the toast.

The toast was drunk with the honours.

After a fitting response from the Chairman,

Mr. A. PELL, M.P., proposed "The Royal Agricultural Society of England, the Highland Society of Scotland, and the Royal Agricultural Society of Ireland." He said that, after the practical speech which they had just heard, he felt himself to be a sort of Telemachus sitting by the side of the great Ulysses of agriculture, and he would not detain the assembly by entering into the various questions with which his hon. friend had dealt. No one could doubt that the three Societies embraced in the toast rendered most useful service in the economical system of this kingdom, their great object being to increase the productions of agriculture, and improve the breeds of stock with which these islands were so richly blessed. But he ventured to say that they might in some cases produce a mischievous effect. Some persons who had attended their shows in past times, when they saw the prices, had perhaps imagined that they had only to invest their money to secure a profit by farming; but they had since learnt by experience that that was by no means the case. The first thing that the agriculturist had to do, after attending a great show, was to think. Thought alone would not make a good farmer. In addition to that, there must be practice and care; and without these, no man could be a successful, and therefore a useful farmer, for he maintained that the man who lectured to the practical farmer, without knowing whether or not what he recommended was sure to be successful in a business point of view, was not a useful but a mischievous man (Hear, hear). If at Lady-day or Michaelmas-day they could not obtain something more than a return of five per cent. for their capital and labour, agriculture was but a waste of time. One great advantage connected with the three great Societies which he had mentioned was, that their meetings afforded opportunities for bringing together the three great classes who worked together (long might they continue to do so!) in agriculture. There the greatest of the land and the lowliest members of the agricultural community met for common purposes; and at the same time the intelligent mechanic not unfrequently evinced a deep interest in the machinery employed in farming operations. In conclusion, the hon. member coupled with the toast the name of Mr. Masfen.

Mr. MASFEN, in responding, said the three great Societies included in the toast had done a vast deal of good in their day and generation; and if they had done nothing else, it would have been a great thing to have removed long-standing prejudices which hindered the progress of agriculture. In looking over the list of the Royal Agricultural Society of England he found that the greater portion of it consisted of men who were interested in the management of the estates of great landowners; and he believed there was now a strong disposition on the part of the landed interest to extend to the occupiers of the soil that protection for their capital, the want of which had been such a great obstacle to improvement. So long as tenants were subject to a six-months' notice to quit, they could hardly be expected to invest much of their own capital in the land which they cultivated. Mr. Masfen further referred to

the ensuing meeting of the Royal Agricultural Society at Wolverhampton, in which he took great interest.

Mr. T. CONGREVE, in proposing "The Vice-chairman, Mr. J. B. Spearing," Chairman-elect for 1870, congratulated the company on having secured a chairman for the ensuing year who, though unassuming, had evinced great talent in connection with agriculture.

Mr. SPEARING, after suitably responding, proposed "The Smithfield Club," coupled with the name of Mr. Horley.

Mr. T. HORLEY, Jun., one of the Judges, in responding, said that no gentleman who had gone over the Show could say that it was not one of the best practically that had ever been held; and, comparing it with the shows in Baker-street, they must come to the conclusion that the amount of meat exhibited in the Hall that day was vastly in excess of what any of them were in the habit of seeing at the West End. In going over the various classes, one thing which struck him was, that there were certain animals there which would have been better at home, and many which were disappointing to the exhibitors, because they had not been brought on the right day to run (Hear, hear). Exhibitors should bear in mind that the bringing of an animal there was not like taking it to a breeding show. The Smithfield Club was engaged in producing the greatest possible amount of meat from the carcase and the least amount of offal; and unless the animal were brought in that light condition which would satisfy the hand and the judgment of the most fastidious man, it was not to be expected that it would stand in the position that the owner desired (Hear, hear). With regard to the management of the Smithfield Club, there might be, and there no doubt were, some points with respect to which it should step out, and some little alteration be made; but he did think that the way in which the stewards and the honorary secretary, assisted by the Executive of the Agricultural Hall, conducted the shows, was a pattern to those who had the management of similar gatherings in the country (cheers).

The Rev. E. SMYTHIES, in proposing "The Committee of Management," coupled with the name of Mr. Henry Trethewy, expressed his sense of the increasing desirableness of associating landed proprietors with the proceedings of the Club, adding that he hoped some of them would undertake to read papers.

Mr. TRETHEWY, in responding, said he felt it a great compliment to have been selected by the Committee to perform that duty. The Committee would, he remarked, be very glad if gentlemen of the class referred to by Mr. Smythies would undertake to introduce a subject. Every member received a circular inviting him to read a paper, and he hoped the matter would not be lost sight of by the members generally. It was now about 20 years since he first had the honour of joining the Committee, and he could conscientiously say that his attention to the business of that Club had always been to him a source of great satisfaction, and that he rejoiced at the results which had been attained. Fifteen or sixteen years ago, or perhaps a little further back, the Club was almost in a bankrupt position, and one member of the Committee actually resigned because he thought it would not be able to pay 20s. in the pound (laughter). In happy contrast to that state of things the Club had now an invested fund of £1,200. He could not help adding one or two words respecting some of those whom they had lost by death or some other cause. Looking back 15 or 16 years he was reminded of such men as Mr. Fisher Hobbs and Mr. Baker, whose portraits they still preserved, and the recollection of such losses somewhat diminished the pleasure which he felt in the retrospect of the past. He would not continue that strain, but he thought the memory of such men ought not to pass away (Hear, hear). Before sitting down he wished to propose the health of a gentleman who filled a most important post in that Club and also was

well known to all of them. It was quite unnecessary for him to take up any of their time in proposing "The Health of the Secretary," whose labours he was sure they all appreciated (cheers).

Mr. CORBET, after returning thanks for the compliment, said he could not help saying a word or two respecting the gentleman who had filled the chair that year. He was not in the habit of paying unnecessary compliments, but he must say that no man ever filled the chair of that Club with greater credit to himself, and none ever did more for its welfare either in that room or out of it, than Mr. James Howard (cheers), whose absence they all so much regretted (Hear, hear).

The CHAIRMAN gave as the last toast "The Visitors," associated with the name of Sir Massey Lopes, M.P.

Sir M. LOPES said: I trust this is the last instance of my health being drunk as a visitor: I trust that ere long my name will be enrolled among the members of this club, and that I shall no longer be considered a stranger among you. I have not taken up agricultural questions for the first time within the last few years. Many years ago it was my lot, after having taken my degree at Oxford, having nothing better to do, to serve an apprenticeship to a farmer in Scotland, and I look upon what I learned there as the most useful part of my education. I happened to be the successor to land which was not in the best condition, and I thought that if I went to the Lothians it might be an advantage to me as an English agriculturist. I must say that what I learnt in Scotland was not exactly suitable to the county of Devon, where I live (Hear, hear). One word with regard to a question in which I have lately taken special interest—I mean local taxation. If I had not had the support of farmers and of my two hon. friends on my left (Mr. C. S. Read and Mr. A. Pell) I should not have been so presumptuous as to introduce such a difficult and abstruse question in the House of Commons. That question is not a party one; we have a good cause and a great case, and all we have to do is to influence and educate public opinion, because this is a question which concerns not agriculturists only, but all classes of society. I feel that the movement is progressing, but we want more vigour and a little less of that apathy which is I must say more conspicuous among landlords than among tenant-farmers. What we want is unity, and one great advantage of such a Club as this is that it tends to create unity. We need to meet together more as landlords and tenant-farmers, and I feel sure that the more we do meet together and the more we see of each other the more we shall appreciate each other. If we landlords are to receive wholesome advice, it is far better that we should receive it face to face than behind our backs, and I feel quite certain that whatever is uttered with good temper will produce due effect. I look upon the Chambers of Agriculture as one of the greatest powers that the agricultural interest has ever possessed, and I grieve that so few landlords take part in their proceedings. There is a good old Cornish proverb: "One and all"—and that indicates what we now want. We are at present too much like scattered sheep: there is not sufficient combination and co-operation among us, and that is the reason why we are so much fleeced. If, instead of there being so many landlords in the House of Commons we had a few more tenant-farmers, depend upon it your interests would be much better looked after. There is not very much sympathy with landlords in that House. If a tenant-farmer make an appeal, that appeal is listened to with respect; but as to the landlord, the sooner he hides his diminished head the better (laughter). It is said to be the old story, and they are chaffed about distressed agriculture. Depend upon it there shall be no want of vigour or energy on my part, though I may not succeed (cheers).

The company then separated.

A NEW LAND BILL FOR ENGLAND.

At the December discussion, Mr. Edmunds of Rugby, in his own words "merely rose to ask The Farmers' Club whether they really thought for one mo-

ment that England required an Irish Land Bill? He believed that no such absurdity was ever started." And as he rose to say so much, Mr. Edmunds sat down again.

declaring that "the less they had of centralisation or of Government interference with the ordinary transactions between man and man the better." These remarks would seem to have been made in answer as it were to a paper just previously read by Mr. Trask, of Highleaze, on The Size of Farms, in which the introducer of the subject had expressed his conviction that "at no distant day a Land Bill will become as necessary in England, as the noble measure of justice which has become law this year, was found to be necessary for Ireland." Now this by no means implies, as, however, the question put by Mr. Edmunds would infer, that any-body had ever advocated at the Farmers' Club the necessity of an Irish Land Bill for England. That, of course, which is required for England is an English Land Bill, as, no doubt, the adoption of any amendment in this way in one part of the United Kingdom may lead to something more being attempted in another. At a meeting of this same Club in the spring of the year the author of the paper under consideration had stated that if he tried to read the signs of the times, he should say it was by no means improbable that the present Government took up in turn the land question in England; while Mr. James Howard supported this by stating how, of his own knowledge, "there was a very growing impression amongst the members of the House of Commons that the Irish Land Bill must be followed by an English Land Bill, as, indeed, the one was a corollary of the other." And Mr. Howard, be it remembered, is a member of the House of Commons. Mr. Trask, as it seems to us, went no further than this, as no one, in fact, "started such an absurdity as that an Irish Land Bill was requisite for England."

But Mr. Edmunds himself went a deal further, that is, if we properly understand the purport of what he said: "the less they had of Government interference with the ordinary transactions between man and man the better." And this being duly interpreted, we shall assume, to mean simply that so far as the ordinary transactions between landlord and tenant are concerned, no English Land Bill is required. Mr. Howard, Mr. Trask, and others fancy they see that some such measure "coming;" but then, according to Mr. Edmunds, at the Farmers' Club, nobody wants it, or "the less of it the better." This sounds somewhat startling after all the farmers have been doing of late years to improve their position in the State. Hitherto the Land Law has in practice been found to be pretty much upon one side, and in the ordinary transactions between man and man the landlord has had it generally all his own way. At any rate, for the last quarter of a century or so the point of hundreds of papers and the conclusions at thousands of meetings have been to the effect that it would be all "the better" if there were some "Government interference" to amend the relations between man and man, that is to say between landlord and tenant.

Should not, for instance, the farmer's capital be secured to him by some broad general recognition of the Tenant Right principle? But so far it is not; and at this very moment the western counties of Hereford and Devon are wild with excitement at the injustice that has been done, and clamorous for some good English Land Bill. Enough, in fact, was said at the Farmers' Club dinner on the Tuesday to show how this subject is growing, as that, according to Mr. James Howard, "the Legislature of this country will entertain the question of an English Tenant Right Bill." And this of course is interference between man and man. Again, how is the abominable Game evil, against which, as we have seen during the last few months, it is quite impossible to farm, to be effectually attacked but by Government interference in the ordinary transactions between man and man? A new Land Bill must enact that rabbits are mere vermin, to be treated as such, and that any one who chooses to create an abuse shall do

so at his own cost and not at the expense of other people. Or, further, why should any landlord, or more especially any such a landlord as this, who has ruined a man by game or turned him out in the world without giving him his own again, have the prior claim on the tenant's means and produce? Does the law of distress for rent require no amendment? do man and man in this matter deal quite fairly, when one takes all and the other creditors little or nothing?

The plain truth is that English Land Laws as they now read are as lop-sided as they well can be; made by landlords for landlords, and so far as the ordinary transactions between man and man go on little other consideration. There are, moreover, in this age of competition customs or practices growing up that, if not precisely laws, require the attention of the law. For example, there is the pernicious business of putting up farms to let by auction, when the worst man commonly gets in, as of course sooner or later he is sold out, when under the present delightful circumstances the landlord has the right to "satisfy" himself in the face of everybody else. "In the county of Somerset," says Mr. Trask, "where the moderate-sized farms largely prevail, the competition is something enormous, and we are beginning to hear of the loathsome system of offering bribes to agents to get farms, and in one case, that has recently cropped up, an agent is greatly belied if he didn't accept a bribe of £100 from an in-going tenant, for whom he got the farm, and that too with the owner's knowledge." Why, we could surely never expect to hear of anything worse than this in Ireland, as the case, indeed, quite out Herods the "Good will" that has been so much protested against. But here in England, down in Somersetshire, the small farmer must not only find capital sufficient to stock the land, but to fee the agent. These are not perhaps so much the ordinary as the extraordinary transactions between man and man, but they must be looked to nevertheless, as we often enough have to legislate on exceptions to the common principles of honesty.

The fact is, as it seems to us, that Mr. Edmunds has got hold of a pet but utterly obsolete phrase when he talks of not interfering between man and man in their ordinary transactions, that a man must take care of himself, and all that sort of thing. Whereas in almost every walk of life, save in the practice of Agriculture, the weaker is protected against the stronger. The tradesman knows full well that he must treat his apprentice as the law directs; the master cannot ill-use his servant without being held amenable. If a man has been over-reached in the purchase of a house or a horse, the Government "interferes" in the transaction with a view to seeing him righted. But on the farmer's behalf no one interferes. The landlord may ill-treat him or the agent over-reach him, and he has really no remedy. They may turn him out without offering him a sixpence for all that he effected, as has been done lately, or they may eat him up with game, as is done daily. And still he is to grin and bear it, for "the less interference there is the better."

But Mr. Edmunds is no farmer himself, or, as he explained to the Farmers' Club, only in a very small way, and hence it may be questioned how far his opinions represent those of the farmers. That an English Land Bill will be brought in is tolerably certain, perhaps a measure of more scope than is expected, as that this is required is equally beyond a doubt. We have only to hope that the landlords, who are now working in public with the farmers, will give it a welcome, even though this should not emanate from the landlord side of the House.

THE BIRMINGHAM AND MIDLAND COUNTIES CATTLE SHOW.

The annual general meeting of the Subscribers to the Birmingham Cattle Show, was held on December 5, at the Hen and Chickens Hotel, New-street. In the absence of the President, Lord Combermere, the chair was taken by Mr. C. M. Caldecott. Lord Beauchamp was elected president for 1871; and the Council for conducting the business of the show for the ensuing three years was also elected, in this way:—Vice-Presidents: The Mayor of Birmingham, Lord Lyttelton, Lord Leigh, the Earl of Dartmouth, the Earl of Lichfield, the Earl of Dudley, Earl Spencer, the Duke of Marlborough, the Earl of Aylesford, Lord Walsingham, the Earl of Harrowby, Lord Wenlock, the Earl of Powis, the Earl of Bradford, the Earl of Coventry, and Lord Combermere. Treasurer: Mr. J. Lowe. Trustees: Mr. C. M. Caldecott, Mr. H. Luckcock, and Mr. J. Mathews. The Earl of Warwick, Lord Calthorpe, Viscount Hill, Sir G. R. Philips, Bart., Messrs. C. N. Newdegate, M.P., W. Bromley-Davenport, M.P., G. Dixon, M.P., G. C. Adkins, T. Avery, J. Jaffray, W. James, T. Lloyd, G. F. Muntz, C. Ratcliff, T. Ryland, H. Wiggin, G. Wise, E. Gwyther, W. Holliday, H. Adkins, J. Arnold, H. Barclay, J. Barker, W. A. Beach, C. S. Bigge, J. H. Burberry, T. Burbridge, T. T. Burman, J. Cattell, W. H. Clare, C. Couchman, B. Dain, J. H. Dawes, W. Fowler, E. Freer, J. Gillott, J. Heap, T. Horley, jun., W. Lort, H. Lowe, W. B. Mapplebeck, R. H. Massen, W. Mathews, jun., G. A. May, C. Richards, F. Sabin, J. Smith, G. Steedman, T. Walford, and T. B. Wright. The receipts during the Show, which closed on Thursday, stand thus, in comparison with other years:—

	1866.	1867.	1868.	1869.	1870.
Monday	£214	£249	£213	£195	£200 0 0
Tuesday	£158	£247	£240	£310	£385 8 0
Wednesday	£162	£257	£291	£437	£464 1 0
Thursday	£113	£223	£239	£424	£492 14 6
	£617	£978	£992	£1,366	£1,002 3 6

A vote of thanks was accorded to the retiring President, Lord Combermere, and some other formal votes and resolutions were put and carried. Mr. Albright read a memorial from the promoters of the War Victims' Fund to the council of the Birmingham Cattle Show, asking for donations of seed-corn, to enable the distressed peasants in France to plant their devastated farms. The project seemed to be favourably entertained. Several of those present promised donations to the Fund.

THE BEST FAT PIG AT BIRMINGHAM.

TO THE EDITOR.

SIR,—I find in your report of the Birmingham Show, the following words: "The best single fat pig—although exhibited by the Duckering's, this is quite a chance pig, as the breeder is unknown." I shall feel obliged if you will correct this. The pig was bred by myself, and I exhibited it at the Bath and West of England Show, held at Taunton in June last, when I sold it to the Duckering's for £20. I am surprised at their withholding the name of the breeder, which is a positive injustice to me.

I am sir, yours respectfully,

T. R. CORNISH.

Wolfsgrrove, Bishopsteignton, Nov. 30.

THE POINTS OF THE PIG.

We have been favoured with the following paper by Mr. John Fisher, of Carhead:

1. **HEAD AND EARS.**—The head should be wide in front; ears erect, and pointed forward; chaps rounded, and well filled up to the brisket.

2. **CREST AND SHOULDERS.**—Crest wide, and rising well to the shoulders; shoulder-blades well sloped backwards.

3. **RIBS AND LOINS.**—Ribs well sprung; loins wide, and slightly arched.

4. **HIND-QUARTERS.**—Hind-quarters not to slope, nor narrow towards the tail.

5. **HAMS.**—Hams rounded outwards, well let down, and full at the twist.

6. **CHEST.**—Chest wide, with elbows well out.

7. **FORE-RIBS AND FLANK.**—Fore-ribs wide underneath; flank well let down, straight, and well filled to the stifle.

8. **LEGS AND FEET.**—Legs straight and small in the bone; feet small and compact.

9. **HAIR AND COLOUR.**—Hair plentiful, bright, and vigorous; colour to denote purity of breed.

10. **TAIL.**—Tail entire, thick at root, and tapering.

11. **SIZE.**—Size according to the breed.

TABLE GIVING THE FULL VALUE TO PERFECTION IN EVERY PARTICULAR POINT IN THE PIG:

No.	Award to Perfection		
1. Head and Ears	8
2. Crest and Shoulders	8
3. Ribs and Loins	12
4. Hind-quarters	10
5. Hams	12
6. Chest	10
7. Fore-ribs and flank	15
8. Legs and Feet	10
9. Hair and Colour	10
10. Tail	5
11. Size	10

Award a lesser number to each of these points in the proportion that it falls short of perfection or the highest standard of excellence. Thus—if the head be long or narrow, the chap light, and the ears hang down over the eyes, award only 6 or 4, or 2 or 0, as they may deserve; and so on through all the points. Then add the number of awarded points together, and the total will give the order of merit in the animal.

THE CAUSES NOW IN OPERATION WHICH DISCOURAGE THE APPLICATION OF CAPITAL TO AGRICULTURE.—At a meeting of the Leicestershire Chamber of Agriculture, some time having elapsed before any member would open a discussion on this subject, Mr. Foster eventually did so, by moving the following resolution: "That in the opinion of this Chamber the main causes at present in operation which prevent the application of capital to agriculture are, first, the comparatively unremunerative nature of the occupation; second, the want of sufficient security for capital invested therein; and third, the ravages occasioned by the over-preservation of ground-game." Mr. Foster said in putting this that "Two years ago they had a very similar season to contend with to the present, and there was a fair yield of wheat on most soils—he believed there would be this year; but he would confidently say that he should produce nearly a quarter of wheat per acre more this year than he did two years ago, and that would be mainly, if not wholly, due to the destruction of game on his farm. It was nonsense to say that the landlord would meet the tenant in the matter of rent, where such a state of things existed as he had pointed out (Hear, hear). For in his case he should derive more benefit from his wheat land this year in consequence of the destruction of the ground game, than the whole rent of the land would come to. He was happy to say too, that on the estate upon which he lived, a neighbour of his had been successful this year in winning the prize offered by the Rugby and Dunchurch Agricultural Association, for the best managed farm. He did not think it possible under the state of things that existed two years ago, for any farmer on that estate to farm his land so as to win a prize; it was wholly owing to the destruction of game that he had been able to do so." Mr. Simpkin seconded the resolution, which was carried.

BIRMINGHAM AND MIDLAND COUNTIES CATTLE SHOW.

The fact that the best beast in Bingley Hall this season could reach no higher than a high commendation when exhibited at Islington last year, would at the first blush of it go to imply that the show is not one of any extraordinary merit. And such an inference is by no means unwarranted. The cattle classes are pretty generally stronger in numerical entries than individual excellence; and, with the exception only of Mr. Pulver's ox, there is not an animal to be found amongst the three "established" English breeds of really great pretensions for such a meeting, although the polled Scots and crosses have here and there more merit, if this be not so clearly spoken to in the prize-list. Noticeably enough the Herefords which came out so well during the summer are now proportionately weak, as there was not a beast amongst them that stood any chance for any honours beyond beating something of his own breed. The best of all the white faces, Mr. Cocks' steer, has great size and plenty of meat, but he lacks style, and is altogether coarse and common; the second best in the class from the same stalls showing more quality and symmetry, and Mr. Price's third prize being a very smart taking steer, but not so ripe as he might be. The handsomest Hereford, however, was the best steer of the other class—a beast full of fine character, set off by such points as a blood-like head and kindly expression, a broad open front, and a rich-coloured curly coat. He comes of the famous Leen herd, as, when we saw him at Hereford in the autumn, we said this beast would "make his mark hereafter." Nevertheless, the judges dwelt terribly over this animal and a steer bred by Mr. Shirley, but fed by Mr. Heath in Norfolk, and a good butcher's beast no doubt, as level and firm, but bad in his quarters, and altogether mean in his appearance, beginning with a cunning bad head, and wanting altogether the nobility of the other. Her Majesty's third prize was to the eye more of a mongrel than a Hereford, and the remainder of the class as indifferent as need be. There was a larger entry than usual of Hereford cows, as one might have looked reasonably enough here for the best of the breed, with such well-known winners as Mr. Rogers' Silk, Mr. Hill's Excelsior, and Mr. Ridgley's Cherry in the class, though the judges pronounced a superior to any of these to be a round, deep, well-fed cow from Wenlock; the best for the shambles possibly, but with little of the stamp or fashion of Silk or Excelsior. Still Mr. Rogers' cow was in anything but blooming condition, and Cherry, the Ludlow prize cow, otherwise a very clever one, is sadly disfigured by her bad lumpy quarters. The two best Hereford heifers were a long way before the rest of the class, and both so good that one only wonders the more why the Mayor's prize went to a steer?

At the Oakham show in 1869 Mr. Pulver, a yeoman of Broughton, near Kettering, showed a Shorthorn steer, by Biddenham, a bull from Mr. Charles Howard's Spencer tribe, but bred by Sir W. de Brooke, that took a second prize in an All-England class to Mr. Roland Wood's Little Wonder, the best beast in the show. Young Biddenham then came on to the Smithfield Club Meeting, where in the certainly "crack" class he was only highly commended, Lord Aylesford's steer, the best animal of his year, being first, Mr. Wood's Little Wonder second, and a steer of Lord Penrhyn's third. Still one of the judges said, "if kept on for another year, this very stylish steer will

be sure to command a foremost place." Mr. Pulver thence travelled his beast on to Leeds, where he won in his class, but never was in it when the judges came to find the best animal in the yard. During the past summer and autumn he took invariably first prizes for fat stock at Peterborough, Royston, Hinckley, and Wellingborough; as at Oakham in the early part of last week he was not only the first of his class, but the best beast in the show. He had thus "run through" many of the animals he met in his own class at Birmingham. Lord Spencer's long, straight, and "staring"-white ox, his second at Oakham, was now unnoticed; Colonel Reeves's good useful red beast, the Reserve at Oakham, was, as we thought, the Reserve here; and Mr. Rowland Wood's commended entry has often previously been beaten by the winner. It so happened that in a very mixed lot, with some wretched things sent up from all parts of the world, the second prize went to a clever deep and square steer, bred not by Mr. Richard Stratton but Mr. Joseph Stratton, and unquestionably the next best, but not so well made up for show as he might have been; while a Scotch ox of nice quality, but with his tail badly set on, just beat the Grantham red for third, although it will always be a near thing between them. The Shorthorn steers were a still more moderate lot, of which Mr. Robert Searson's white, the first in his class at Oakham, looked to have the most promise of framing out into a good beast, but he was not so forward as Lord Aylesford's short podgy steer, with a head stuck in or on to his back, set off by bad outstanding shoulders, which the judges accordingly put first, possibly for quality but certainly not for symmetry. When it came to naming the best of all the Shorthorns the authorities paid the cow classes the equivocal compliment of not having the winner out again, a nice thriving cow nevertheless, that has been backing Mr. Mumford's luck of late by winning all about the country. Lord Feversham's second is plain and patchy, but of high quality, and Lord Anglesey's third, the best at Walsall, grown so out of form into excrescence, that it is difficult to understand how any man with "an eye" could ever give her a prize. We are not quite so sure, after all, but that Mr. Reid's Scotch Shorthorn heifer, so straight, deep, and handsome, or Lord Dunmore's very successful cross, quite "pretty" in her looks, and yet with a great long well-furnished frame, was, one or the other, the best of all the cows and heifers; as there were four or five good Shorthorn heifers in the class, but with all the honours going North, and Mr. Wood's best at Oakham altogether overlooked here. Dowager was now, however, in very different company.

According to the prize list the general merit of the Devons was something extraordinary. There were, for the four classes, in all some sixteen or seventeen shown, with scarcely one of these but that received some compliment from the judges. Thus, in the only class where there was anything like competition, that of the oxen or older steers, three commendations were appended to the three prizes; the winner as usual coming from Mr. Smith, of Exeter. This is a big meaty well-covered steer, with capital flesh, but by no means so smart nor so blood-like as a North Devon should be; while the second best is a commonish but passable animal, that either for breeding or feeding did not look to be the superior of Mr. McNiven's third prize, or even of the high commendation. The judges, moreover, never took these classe

into the central avenue of the Hall, but went over the entries as they stood—an injustice alike to themselves, the spectators, and the exhibitors, as it is next to impossible to get a proper notion of any animal until you see him fairly out, let alone the bad “effect” of judging after this hole and corner fashion. There were only three younger steers, and only one good, a very smart beast from the famous Broughton pastures in the Aylesbury Vale, said through a mistake of his breeder, Mr. Baker, to be entered at three years and six weeks instead of three years and six months old. In the succeeding class of cows, Mr. Walter Farthing having lost his cow put one of his prize heifers in her place, that was merely commended, the winner being a very true high-bred cow from the herd of Mr. Newbery, but exhibited by Mr. McNiven. The two other prize cows were of not so much mark; but the three prize heifers were all good, the first and second especially so, although at breeding shows Daisy has beaten the Royal Adelaide before now. Still the pick of the three was unquestionably Perfection, who, but for her falling away a little in her quarters, went far to realize her title. She has lots of style, a sweet head, a long, straight, well-covered frame, with a good touch, and heavy accordingly is the wagering that she will be first, and first both in Birmingham and in London. But still she was not the best of all the Devons, nor even of the Devon cows and heifers, and perhaps Lady 2nd might fairly compete with her; but if it ever does come to a champion from this lot of Devons in London we certainly do not expect to see Mr. Smith's steer again at their head.

It will be so gathered that if there were any great merit in Mr. Pulver's ox, he could have no difficulty in his path so far. And he has indisputably great merit in many ways. He is a smart rich roan in colour; he is a compact square rather than an overwhelming animal; he has fed so well that his flesh does not seem to encumber him as it does many a fat beast, but he has a cheerful look and gay carriage, as it is not until you see him out that he moves after a somewhat awkward ungainly fashion. He has an especially good forehead, is well ribbed up, and straight and square in his outline, but bad in his purse, having suffered terribly from castration, and standing rather weak from behind. Of course he was not only at a glance the best of his class, being ordered in very early, but as easily the best of his breed; and although Mr. George Turner held out afterwards, the other judges and the lookers on only smiled, as the pretensions of Mr. Smith's Devon when put in comparison with the Shire Shorthorn made it something like a horse to a hen. However, Mr. Turner did his duty to his county as he did when it came to the best of all, and, as everybody else had seen long previously, the Shorthorn eventually took every prize there was to be taken, as he goes on to Islington for the Champion Plate, and again to Leeds in competition for a similar premium. Good as he is, comparatively, we do not regard the further success of Young Biddenham as by any means a certainty, for he falls just short of being a grand beast when you meet him, and if anything at Birmingham should close up with him again, there will be more danger to fear from the North than from the West, despite the best cow and Mr. Turner's unqualified admiration of the Exeter steer.

“From Tillyfour will undoubtedly go the heaviest fat polled bullock that will be shown in Bingley Hall and Smithfield this year. This animal is a five-year-old, and a full brother to the famous Black Prince, that carried everything before him in these two exhibitions, and went, by desire of Her Majesty, to Windsor for the Queen's inspection. The Tillyfour ox of 1870, however, is not considered so fine an animal, but he is quite as fat, and of exactly the same girth—9 feet 10 inches. In the heifer classes Mr.

M'Combie will show Bess, now four years old, and bred by Mr. Skinner, Drumin, Ballindalloch. This animal carried the first prize as a two-year-old heifer at the Highland Society's Show at Aberdeen in 1868, when the property of the breeder. She was purchased by Mr. M'Combie in the Autumn of that year, at a high figure, for breeding purposes. She had not proved a breeder, however, and is now considered a model heifer.” We were enabled to say so much in our last week's number, and *The Scotsman* was well-advised, for the brother to Black Prince has little beyond his size in his favour, and he took no prize; whereas the cow is as true and level as a die, and as handsome as a picture; and though she may have failed at the herd, she is a great success in the stalls—a greater, perhaps, than they quite considered her in Bingley Hall on Saturday. The same authority enabled us to forewarn our readers that “Mr. Heath Harris, of Earnhill, has catalogued for Smithfield two perfectly-shaped and highly-fed, but not heavy animals. One of these is the three-year-old polled bullock which carried off so many first prizes at the Highland Society and other shows while in the possession of the breeder, Mr. Bruce, Newton of Struthers, and also the cup at Forres last December, where Mr. Harris bought him for 100 guineas. The heifer, a Shorthorn, from Earnhill, is the two-year-old roan Shorthorn bred by Mr. Harris, and which won the medal at Forres last year, and the second prize at Elgin last summer.” And the ox from Earnhill duly won in his class, uniting fine quality with great symmetry, and timed almost to a day. When, then, having disposed of “the best fed and bred,” the judges had to select the best of all the steers, and the Shorthorn was opposed by the Scotch polled and the Scotch cross, it looked a deal more like a matter for “nice argument” than it had been with the over-rated Devon. Not that Messrs. Martin's cross, all after the Shorthorn in his character, was so very formidable, as he is slack in his back and an up-and-down beast at best; but the Scot is an animal of quite another colour, and if we named any two entries of any one breed to do even better in London we should take Mr. Harris' ox and Mr. McCombie's cow. It is questionable, indeed, whether the services of a North country judge should not occasionally be secured, as the lowland men seemed to go all wrong over the West Highland cattle, Lord Southesk's second being full of fine national character, a truly handsome, and hardy mountaineer; while the one put above him is a sour-headed plain beast with more flesh and nothing else in his favour. Those other Longhorns, once the pride of our Midlands, were carefully stowed away into two odd corners, where the judges made short work of their merits, and where we only saw them by accident. They reached to eight entries in all, and to one of the Welsh breeds.

History repeats itself at Birmingham, at any rate in recording a sheep show; and Lord Walsingham's smart Southdowns and Lord Berner's fine Leicesters year after year continue to take all the chief prizes. Then, few of the famous Hill-men ever make an entry, and anyone who chooses to send on wins with Cotswolds, as Mr. Hall of Barford did, with some nice sorty pens of some character. The few lots of useful Oxfords were so befouled with nastiness that the judges and everyone else declined to subject them to the ordeal by touch; and the “other” crosses were not so remarkable for merit as we had been led to expect. These experiments generally show stronger in London. There were two or three entries of Hampshire Downs, with scarcely any competition in any of the breeds for the classes of single ewes. Noticeably enough in these getting-about times one of the sheep judges, Mr. Rigden, had never previously been in Bingley Hall,

where nothing struck him more than the show of Shropshire, nor can we remember them so good for some time past. There was more uniformity, and though Lord Cheaham maintained his lead and won in both classes, his sheep had more of the Shropshire and less of the South-down in their appearance, as they are now fast realising the type of what an "Improved" Shropshire should be. The small class of old wethers was of especial excellence, but the sheep in Mrs. Beach's reserve pen were not cleverly matched, with here a dark and there a light face. The Lincolns were not numerous, but they were mostly good, what with their fine wool, great size, and "breedy" looks.

With the exception of the class of large breeding pigs, this section of the show was better than usual, with some of the entries of especial excellence. The best single fat pig was, for instance, one of the best out for many a long day; so good all over, indeed, as to be considered to possess within six of the several points at which Mr. Fisher puts a perfect pig, on this scale: Head and ears, 8; crest and shoulders, 8; ribs and loins, 12; hind quarters, 10; hams, 12; chest, 10; fore ribs and flank, 15; legs and feet, 10; hair and colour, 10; tail, 5; size, 10. Although exhibited by the Duckerings, this is quite a chance pig, as the breeder is unknown, and the age put at "about" eighteen months. Not that this has apparently much to do with it, for as a well-known man has it "in judging a pig I never take age into much account, as this as is likely to be put wrong as right," and no doubt the examination is little more than an amusing farce, as the occasional disqualifications and subsequent protests so continually testify. Beyond the first prize there were a number of good pigs in this class, with Mr. Peter Eden taking both second and third, the younger of the two, otherwise very true in his frame, being a trifle too long in his body. In the pens of three fat pigs the Messrs. Duckering had again the best of all, with some of their own sort, Her Majesty being a good second in both of these classes, as the white Windsors promise to be coming back to their old form. Mr. Cartwright, on the contrary, could get no nearer than third in a class of three entries, but one of his team died a short time since, and an odd lot from the same litter had to be put forward in his place. These entries, however, were all unmistakeably good with the Reverend Henry Baily's Berkshires as the best; as the Swindon pigs have long been esteemed by judges out of the show, though they have never, so far, been very successful in public. The pens of breeding Berkshires supplied the best class in the Hall, and one which narrowly escaped a general commendation. So meritorious were some of these that the judges rather divided over the use and size of Mr. Fowler's litter, and the finer quality of Mr. Smith's pen. Then Mr. Humphrey's sample was very nearly as good; and there were in fact plenty of prize pigs to be bought and sold in what seemed to be a brisk market. The Messrs. Howard, of Bedford, were unable from a suspicion of disease to send any of their entries, and the class of large white breeding pigs was, as we have said, very moderate or more positively indifferent, the first and second prizes going to exhibitors not hitherto much distinguished in this way. The small breeding pigs, on the contrary, with Mr. Eden still in the ascendant, were very nice, as a small pig is always more pleasing to the eye than a large one. The Manchester sort, moreover, were just separated in the return list by Mr. George Turner, junior's, pretty blacks; while Mr. Matthew Walker had to be content with an extra medal. But then, in good company, anything is worth having.

Considering that the past season was most unfavourable for the cultivation of roots the display upon the whole is remarkably good. The mangolds are an extraordinary show, the globes being better than we ever remember to have

seen them in Bingley Hall. The swedes, kohl rabi, and carrots are very meritorious, but common turnips, with one or two exceptions, are very moderate; while the ox cabbage is as poor as anything could be, the best three specimens weighing only 85 lbs. against over 160 lbs. last year. The entries for the two cups given by Messrs. Proctor and Ryland, and Sutton and Sons, compose an exhibition in themselves, the prizes being closely contested. The aggregate weight of the collection from Mr. Hicken, that won Messrs. Proctor's cup, was 436½ lbs., viz.: 6 long mangolds, 212½ lbs.; 6 globes, 181 lbs.; and 6 swedes, 43 lbs. The weight of the prize collection for Messrs. Suttons' cup was 454 lbs., the 6 long mangolds being 194½ lbs.; 6 globes, 142½ lbs.; 6 swedes 36 lbs.; 6 kohl rabi 42½ lbs.; 6 turnips, 38½ lbs. The prizes for the class of mangolds and swedes were all awarded to roots of a superior quality, but of less weight than many of the other entries. In corn, the wheat, both red and white, is remarkably good; but oats and peas, with the exception of the white peas, are very indifferent, the prizes being withheld in several classes for want of merit.

The potatoes this year are remarkable both for extent and quality, there being 185 entries, nearly the whole of which were sent. In the classes for named varieties were excellent specimens of all the best kidneys; while King's Milky Whites, Flukes, Red Regents, and Paterson's Victoria were all exceedingly well represented, the latter especially so. There were no less than 47 entries in the class for any other named variety, and the judges had great difficulty in awarding the four prizes at their disposal. This class was a show in itself, and included many of the American potatoes which have been introduced during the last two or three years, and that for quality and productiveness deserve the attention of English growers. Some remarkable specimens of the "Bovina," or cattle-feeding potato, were also exhibited.

We append the weights of the principal pens in those classes of poultry which will be most likely to interest our readers: Ducks, white, Aylesbury, drake and duck, first, 18lbs. 9oz.; second, 18lbs.; third, 17lbs. 6oz.; fourth, 18lbs. 4oz. Rouen, drake and duck, first, 19lbs. 4oz.; second, 10lbs. 6oz.; third, 18lbs. 2oz.; fourth, 17lbs. 4oz. Geese, white, exceeding one year, gander and goose, first, 58lbs. 12oz.; second, 56lbs. 5oz.; ditto, birds of 1870, first, 49lbs. 4oz.; second, 49lbs. Grey and mottled gander and goose, exceeding one year, first, 62lbs. 6oz.; second, 54lbs. 6oz.; ditto, birds of 1870, first, 53lbs. 6oz.; second, 49lbs. 1oz. Turkeys, cocks, over one year, first, 36lbs. 4oz.; second, 35lbs. 2oz.; ditto hatched 1870, first, 24lbs. 6oz.; second, 23lbs. 12oz.; hens, exceeding one year, first, 31lbs. 4oz.; second, 29lbs. 1oz.

PRIZE LIST.

CATTLE.

JUDGES.—R. J. Newton, Campsfield, Woodstock.
Stiles Rich, The Cedars, Worcester.
George Turner, Bramford Speke, Exeter.

HEREFORDS.

OXEN OR STEERS.—First prize, £15, silver medal as breeder, Philp Turner, Leen, Pembridge, near Leominster; second, £10, Wm. Heath, Ludham Hall, Norwich; third, £5, Her Majesty, the Queen, Windsor Castle. Commended: Henry Bettridge, East Hanney, Wantage, Berks.

STEERS.—First prize, £15, silver medal as breeder, extra prize of £10 10s., given by the ex-Mayor of Birmingham for best Hereford bred by the exhibitor, extra prize of £20 for best Hereford, Benjamin Cocks, Tugford, Munsalow, Salop; second, £10, Benjamin Cocks; third, £5, John Price, Court House, Pembridge. Commended: Richard Shirley, Bancott, Munsalow, Church Stretton.

Cows.—First prize, £15, silver medal as breeder, Thomas Instone, Bourton, near Much Wenlock, Salop; second, £10,

Herbert Ridgley, Steventon, near Ludlow; third, £5, Thomas Rodgers, Coxall, Brampton Brian, Herefordshire. Commended and reserve: Richard Hill, Orleton Court, Ludlow.

HEIFERS.—First prize, £15, silver medal as breeder, H. M. The Queen; second, £10, James Wm. James, Mappowder, Court, near Blandford, Dorset; third, £5, John Baldwin, Luddington, Stratford-on-Avon. Commended and reserve; Richard Henry Ridler, Gattertop, Hope-under-Dinmore, near Leominster.

SHORTHORNS.

OXEN OR STEERS.—First prize, £15, silver medal as breeder, President's Silver Cup, of £25, for best ox or steer, bred and fed by exhibitor, Earl of Aylesford's extra prize of £15 for best Shorthorn, bred and fed by exhibitor; Hotel and Innkeepers' of Birmingham Silver Cup, of 25 gs., for best animal in the cattle classes; extra of £20, for best Shorthorn; and Gold Medal, value £20, for best ox or steer of any breed or age, Thomas Pulver, Broughton, Kettering; second, £10, Joseph Stratton, Manningford Bruce, near Marlborough, Wilts; third, £5, Messrs. J. W. Martin, Aberdeen. Commended: Rowland Wood, Clapton, near Thrapston.

STEERS.—First prize, £15, silver medal as breeder, Earl of Aylesford, Packington Hall, Coventry; second, £10, Robt. Searson, Cranmore Lodge, Deeping St. James, Market Deeping; third, £5, Joseph Stratton, Manningford Bruce; Reserve, Thos. Walker, Berkswell Hall, Coventry.

COWS.—First prize, £15, John Aubrey, Mumford, Chilton Park Farm, Thame, Oxon; second, £10, Earl of Feversham, Dancombe Park, Helmsley, York; third, £5, Marquis of Anglesey, Beaudesert, Staffordshire; Reserve, Alex. Brogden, M.P., Lightburn House, Ulverstone, Lancashire.

HEIFERS.—First prize, £15, James Reid, Graystone, Alford, Aberdeenshire; second, £10, John Hunter, Dipple, Fochabers; third, £5, Sir Walter C. Trevelyan, Wallington, Northumberland; Reserve, Richard Heath Harris, Earn Hill, near Forres, Morayshire.

DEVONS.

OXEN OR STEERS.—First prize, £15, silver medal as breeder, extra prize, £20, for the best Devon, Wm. Smith, Hooper, Exeter; second, £10, Wm. B. Shacklady, Upton Court Farm, Slough, Bucks; third, £5, C. McNiven, Perrysfield, Oxted, Godstone, Surrey. Highly commended: Edward Trood, Bowhay, Exminster, Devon. Commended: Trevor Lee Senior, Broughton House, near Aylesbury; Walter Farthing, Stowey Court, Bridgewater, Somerset.

STEERS.—First prize, £15, Trevor Lee Senior, Broughton House, near Aylesbury, Bucks; second, £10, Her Majesty the Queen; third, £5, Wm. Smith, Hooper, Exeter, Devon.

COWS.—First prize, £15, extra gold medal value £20 for best cow or heifer of any breed or age, C. McNiven, Perrysfield, Oxted, near Godstone, Surrey; second, £10, W. M. Aldworth, Frilford, near Abingdon; third, £5, Wm. Smith, Hooper, Exeter. Highly commended: Walter Farthing, Stowey Court, Bridgewater, Somerset.

HEIFERS.—First prize, £15, Trevor Lee Senior, Broughton House, near Aylesbury, Bucks; second, £10, Her Majesty the Queen; third, £5, Richard Burton, Place Barton, Broadclyst, Devon.

LONGHORNS.

OXEN OR STEERS.—First prize, £10, and silver medal as breeder, Sir John Harpur Crewe, Calke Abbey, Derbyshire; second, £5, John Godfrey, Wigston Parva, Hinckley. Highly commended, Joseph Holland Burbury, The Chase, Kenilworth.

COWS OR HEIFERS.—First prize, £10, and silver medal as breeder, W. T. Cox, Spondon Hall, Derby; second, £5, Thomas Satchwell, Knowle.

SCOTCH BREEDS.

POLLED OXEN OR STEERS.—First prize, £15, and extra-prize of £20 for the best Scot, Richard Heath Harris, Earnhill, near Forres, Morayshire; second, £10, William Drysdale, Kilrie, Kinghorn, Fifeshire. Highly commended, and extra-prize of 10 guineas given by C. Ratcliff, Esq., for the best Scot bred by the exhibitor, William McCombie, M.P., Tillyfour, Aberdeen.

WEST HIGHLAND OXEN OR STEERS.—First prize, £15, Sir Walter C. Trevelyan, Wallington, Northumberland; second, £10, Earl of Southesk, Kinnaird Castle, Brechin,

Forfarshire. Highly commended, Duke of Sutherland, Dunrobin Castle; commended, Robert Mowbray, Cambus, Stirling.

SCOTCH COWS OR HEIFERS.—First prize, £15, Wm. McCombie, M.P., Tillyfour, Aberdeen; second, £5, James Bruce, Burnside, Fochabers, N.B. Highly commended: Sir Walter C. Trevelyan, Wallington. Commended: James Reid, Graystone, Alford, Aberdeenshire.

WELSH BREEDS.

OXEN OR STEERS.—First prize, £15, Sir Chas. E. Isham, Lamport, Northampton. Only one entry.

OTHER PURE BREEDS AND CROSS-BRED ANIMALS.

FAT OXEN OR STEERS.—First prize, £15, Messrs. J. and W. Martin, Aberdeen; second, £10, Lord Dunmore, Dunmore, Stirling, N.B.; third, £5, Hy. Bettridge, East Hanny, Wantage, Berks. Highly Commended: James Stephen, Conglass, Inverurie, Aberdeen.

FAT COWS OR HEIFERS.—First prize, £15, Lord Dunmore; second, £10, Alexander Cowie, Crombley Bank, Ellon, Aberdeenshire; third, £5, Sir Walter C. Trevelyan, Wallington. Highly commended: Lord Fitzhardinge, Berkeley Castle, Gloucestershire.

EXTRA CLASSES.

For animals not qualified to compete in any of the preceding classes.

OXEN OR STEERS.—No entry.

COWS OR HEIFERS.—Prize £5 and silver medal, as breeder, H. M. The Queen (Shorthorn). Reserve: W. T. Cox, Spondon Hall, Derby (Shorthorn).

SHEEP.

JUDGES.—F. Spencer, Alma House, Claybrooke, Lutterworth. Wm. Rigden, Hove, Brighton. John Evans, Uffington, Shrewsbury.

LEICESTERS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, silver medal as breeder, extra prize of £10 given by linen and woollen drapers of Birmingham, Lord Berners, Keythorpe Hall, Leicester; second, £10, Lord Berners; third of £5, Wm. Perry Herrick, Beaumanor Park, Leicestershire. Reserved and highly commended: Wm. Brown, Highgate House, Holme-on-Spalding Moor, York.

LINCOLNS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, and silver medal as breeder, and linen and woollen drapers, extra £10, S. W. D. Harris, Wootton, Northamptonshire; second, £10, Chas. Lister, Coleby Lodge, near Lincoln; third of £5, John Pears, Mere, Lincoln. Highly commended: John Byron, Kirkby Green, Sleaford, Lincolnshire.

COTSWOLDS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, silver medal as breeder, linen and woollen drapers' extra prize of £10, Richard Hall, Great Barford, Oxon; second, £10, Richard Hall; third, £5, John Baldwin, Luddington, Stratford-on-Avon; Reserve, John Wheeler, Long Compton, Shipston-on-Stour.

SOUTH DOWNS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, silver medal as breeder, and Mr. Bromley Davenport's extra prize of 10 guineas, Lord Walsingham, Merton Hall, Thetford, Norfolk; second, £10, third, £5, Lord Walsingham. Reserve and highly-commended: Col. Kingscote, C.B., M.P., Kingscote, Wotton-under-Edge. Commended: Prince of Wales, Sandringham; Lord Sondes, Elmham Hall, Thetford, Norfolk.

SHROPSHIRE.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, silver medal as breeder, and Mr. Newdegate's silver cup value 10 guineas, Lord Cheham, Latimer, Cheham, Bucks; second, £10, Wm. Yates, Grindle House, Shifnal; third, £5, Lord Wenlock, Escrick Park, near York. Reserve and highly-commended, Mrs. Beach, The Hattons, Brewood, Penkridge. Commended: Samuel Craven Pilgrim, The Outwoods, Burbage, Hinckley.

Silver cup, value 10 guineas, given by Messrs. Mapplebeck

and Lowe, for best pen of three fat Shropshire wethers, exceeding 22 but not exceeding 34 months old, and silver medal as breeder, Lord Cheaham, Latimer, Cheaham. Reserve and highly commended: Mrs. Beach, The Hattons, Brewood. Highly commended: Lord Wenlock, Eecrick Park; William Orme Foster, Apley Park, Salop.

OXFORDSHIRE.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, and silver medal as breeder, and extra prize of £10, given by linen and woollen drapers of Birmingham, Nathaniel Stilgoe, Adderbury Manor Farm, Banbury; second, £10, Zachariah W. Stilgoe, Adderbury Grounds, Oxon; third, £5, Nathaniel Stilgoe. Reserve and highly commended, Geo. Street, Maulden, near Amptill, Bedfordshire.

SHEEP NOT QUALIFIED TO COMPETE IN ANY OTHER CLASS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, and silver medal as breeder, Alfred Morrison, Fonthill House, Tisbury, Wilts; second, £5, J. B. Downing, Holme Lacy, Hereford. Reserve, Alfred Morrison.

CROSS BREEDS.

THREE FAT WETHERS, not exceeding 22 months old.—First prize, £15, and silver medal as breeder, Matthew E. Jones, Wellingboro' Lodge, Northamptonshire; second, £5, Zachariah W. Stilgoe, Adderbury Grounds, Oxon. Reserve and highly commended: Henry Purser, Willington Manor, Bedford. Highly commended: Colonel Lloyd-Lindsay, M.P., Lockinge Park, Wantage, Berks.

EWES.

FAT LEICESTER EWE, having bred one or more lambs.—Silver medal, Wm. Shipman, Eaton Lodge, Eastwell, Melton Mowbray, Leicestershire.

FAT LINCOLN EWE, having bred one or more lambs.—Silver medal, John Pears, Mere, Lincoln.

FAT COTSWOLD EWE, having bred one or more lambs.—No merit, prize withheld.

FAT SOUTHDOWN EWE, having bred one or more lambs.—Prize withheld, no merit.

FAT SHROPSHIRE EWE, having bred one or more lambs.—Silver medal, G. A. May, Elford Park, Tamworth. Commended, Mrs. Beach, The Hattons, Brewood.

FAT OXFORDSHIRE EWE, having bred one or more lambs.—Silver medal, John Tredwell, Upper Winchendon, Aylesbury, Bucks.

FAT EWE of any other pure breed.—[No entry].

FAT PIGS.

JUDGES.—Samuel Druce, Eynsham, Oxon.

John Fisher, Carhead, Crosshills, Yorkshire.

John Dale, Spetchley, Worcester.

THREE FAT PIGS, of one litter, not exceeding 10 months old.—First prize, £10, silver medal as breeder, Rev. H. G. Baily, Swindon; second, £5, Her Majesty the Queen; third, £3, Thos. Leslie Melville Cartwright, Melville House, Fife and Newbottle, Northamptonshire.

THREE FAT PIGS of one litter, not exceeding 15 months old.—First prize, £10, silver medal as breeder, and silver cup, value 5 guineas, for best pen of fat pigs, R. E. Duckering and Son, Northorpe, Kirton-Lindsey; second, £5, Her Majesty the Queen; third, £3, Earl of Aylesford, Packington Hall, Coventry.

FAT PIG, exceeding 15 months old.—First prize, £6, R. E. Duckering and Son, Northorpe, Kirton Lindsey, Lincolnshire; second, £4, Peter Eden, Cross Lane, Salford, near Manchester; third, £3, Peter Eden. Highly commended: Thomas Bantock, Merridale House, Wolverhampton. Commended: John Spencer, Villiers Hill, Kenilworth; Matthew Walker, Stockley Park, Anslow, Burton-on-Trent.

BREEDING PIGS.

BERKSHIRES.

FIVE PIGS, of one litter, exceeding 3 and not exceeding 6 months old.—First prize, £10, silver medal as breeder, and silver cup, value £5 6s., for best pen of Berkshires, Richard Fowler, Broughton Farm, near Aylesbury, Bucks; second, £5, Joseph Smith, Henley-in-Arden; third, £3, Heber Humfrey, Kingstone Farm, Shrivenham, Berks; silver medal, John

Spencer, Villiers Hill, Kenilworth. Commended: Russell Swanwick, Royal Agricultural College Farm, Cirencester and Heber Humfrey.

PIGS OF OTHER LARGE BREEDS.

FIVE PIGS, of one litter, exceeding 3 and not exceeding 6 months old.—First prize, £10, silver medal as breeder, John Wheeler, Long Compton, Shipston-on-Stour; second, £5, Hy. Robson, Penkridge; third, £3, R. E. Duckering and Son, Northorpe.

PIGS OF A SMALL BREED.

FIVE PIGS OF ONE LITTER, exceeding 3 and not exceeding 6 months old.—First prize, £10, silver medal as breeder and silver cup, value 5 guineas, Peter Eden, Cross Lane, Salford; second, £5, George Turner, jun., Alexton Hall, Uppingham; third, £3, Peter Eden; silver medal, Matthew Walker, Stockley Park, Anslow, Burton-on-Trent.

REFEREE FOR AGES OF STOCK.—Professor Gamgee, 1, Great Winchester-street Buildings, London, E.C.

VETERINARY INSPECTOR.—E. Stanley, 35, Islington, Birmingham.

CORN.

JUDGES.—E. Davenport, Quadrant, Birmingham.

Isaac Kempson, Lionel-street, Birmingham.

TALAVERA WHEAT, sample of 1 bushel.—First prize, £2, F. Lythall, Spittal Farm, Banbury; second, £1, S. Robinson, Shaw House, Melbourne, Derbyshire.

WHITE WHEAT, any other variety, sample of 1 bushel.—First prize, £2, G. A. May, Elford Park, Tamworth (Chidham); second, £1, J. Greatorox, Stretton, near Burton-on-Trent.

RED WHEAT, 1 bushel.—First prize, £2, F. Lythall (Nursery); second, £1, T. Horley, jun., The Fosse, Leamington (Nursery). Highly commended, J. Greatorox (Lammas).

BARLEY, sample of 1 bushel.—First prize, £2, G. J. Mitchell, Newton Mount, Burton-on-Trent (Chevalier); second, £1, J. H. Clark, Altwood, Maidenhead (Chevalier).

OATS, White, 1 bushel.—First prize, £2, F. Lythall (Australian); second, £1, H. E. Raynbird, Basingstoke (Pedigree Canadian).

OATS, Black, 1 bushel.—Prize, £2, F. Lythall (Polands).

BEANS, sample of 1 bushel.—First prize, £2, F. Lythall (French eyes); second, £1, J. K. Fowler, Prebendal Farm, Aylesbury.

PEAS, White, sample of 1 bushel.—First prize, £2, F. Lythall (Banbury prize-takers); second, £1, Joseph H. Clark, Altwood (Ringwood marrow).

PEAS, Blue, sample of 1 bushel.—Commended: F. Lythall.

ROOTS.

JUDGES.—J. Mathews, Edgbaston, Birmingham.

J. H. Burbery, The Chase, Kenilworth.

R. H. Masfen, Pendeford, Wolverhampton.

T. B. Wright, Quarry House, Great Barr.

A silver cup of five guineas, given by Proctor and Ryland for best collection of long mangold wurzel, globe mangold wurzel, and swedes, six roots of each to be shown for this prize alone.—John Hicken, Dunchurch, Rugby.

Sutton and Son's silver cup, value 5 gs., for best collection of six long mangolds, six globe or intermediate mangolds, six purple-top swedes, six kohlrabi, and six turnips.—Marquis of Ailesbury, Home Farm, Savernake Forest, Marlborough, Wilts.

Kohlrabi (six specimens).—First prize, £2, Geo. Fleming, Groundalaw Farm, Stone (Sutton's improved green German); second, £1, Colonel J. S. North, Wroxton Abbey, Banbury. Commended: Anthony Tustain, Great Barford, near Deddington, Oxon; Colonel North.

LONG MANGOLD WURZEL (six specimens).—First prize, £2, with £2 2s. added by Proctor and Ryland, Sir Frederick Smythe, Acton Burnell, near Shrewsbury (Sutton's long red mammoth); second, £1, Hy. Allsop, Hindliss Hall, near Worcester (Sutton's mammoth red). Highly commended: Marquis of Ailesbury; John Moore, Warwick and Long Itchington; John Moore, Wm. Dickinson, New Park, Lynton, Hants. Commended: W. R. Boxall, Strathfieldsaye, Winchfield, Hants (Sutton's long red); John Hicken, Dunchurch.

GLOBE AND INTERMEDIATE VARIETIES OF MANGOLD WURZEL (six specimens).—First prize, £2, with £2 2s. added by Proctor and Ryland, Sir Frederick Smythe, Acton Burnell

(Peter's yellow globe); second, £1, John Hicken. Highly commended: Thos. Keen, Great House, Moore, near Glastonbury (Impey's Defiance yellow globe); John Baker, Witham Farm, near Somerton, Somerset (Impey's Defiance yellow globe). Commended: Thos. Gunnell, Willow House, Milton, Cambridge; Hy. Allsop, Hindliss Hall (Sutton's yellow globe); Geo. Fleming, Grownalow, Stone (Sutton's Berkshire prize variety); John Moore, Warwick; Wm. Dickinson, New Park, Lymington; Chas. West, Flowers Farm, Pangbourne; Col. North.

SWEDES OF ANY VARIETY (six specimens).—First prize, £2, and extra £2 2s., Wm. B. Boxall, Strathfieldsaye, Winchfield (Danger's Champion); 2nd, £1, R. Shirley, Bancott, Munslow, Church Stretton, Salop (Drummond's Improved). Commended: T. Hinks, Halford, Shipston-on-Stour, Worcestershire (Purple Bark).

COMMON TURNIPS, white flesh (six specimens).—First prize, £2, Hy. Woods, Clipston-park Farm, Mansfield (Green Barrel); 2nd, Hy. Woods (Green Barrel).

COMMON TURNIPS, yellow flesh (six specimens).—First prize, £2, James Stephen, Conglass, Inverurie, Aberdeen (Green-top Aberdeen yellow); 2nd, £1, Wm. McCombie, Tillyfour.

CARROTS OF ANY VARIETY (six specimens).—First prize, £2, Hy. Woods, Altrincham; 2nd, £1, Wm. Dickinson, New Park (white Belgian). Highly commended: Geo. Fleming (Long red). Commended: Antony Tustain, Great Barford, near Deddington, Oxon (Long red).

Ox cabbage (three specimens).—First prize, £2, R. Hall, Great Barford; second, £1, G. Greatorox, Stretton (Robinson's Champion Drumhead).

POTATOES.

Ashleaf kidneys (twelve specimens).—First prize, 15s., F. Lythall; second, 10s., C. J. Perry, The Cedars, Castle Bromwich. Highly commended: A. Tustain, Great Barford.

River's Royal ashleaf kidneys (twelve specimens).—First prize, 15s., H. Woods; second, 10s., J. Choyce, Pinwall Grange, Atherstone. Commended: F. Lythall.

Gloucestershire kidneys (twelve specimens).—First prize, 15s., Z. W. Stilgoe; second, 10s., T. Barnett, Walford, Herefordshire. Commended: J. Choyce, C. J. Perry.

Daintrees' first early (twelve specimens).—First prize, 15s., C. J. Perry; second, 10s., J. Choyce.

King of potatoes (twelve specimens).—First prize, 15s., C. J. Perry; second, 10s., G. A. May, Elford Park. Highly commended: J. Choyce, J. K. Fowler, Aylesbury. Commended: J. Choyce.

Wheeler's milky white (twelve specimens).—First prize, 15s., J. C. Wheeler and Son, Gloucester; second, 10s., E. Freer, The Grange, Ward End, Birmingham. Commended: John Choyce.

Flakes (twelve specimens).—First prize, 15s., Z. W. Stilgoe; second, 10s., C. J. Perry. Commended: John Lynn, Church Farm, Shoxton, Grantham; J. K. Fowler.

Dalmahoy's (twelve specimens).—First prize, 15s., Hy. Woods; second, 10s., John Choyce. Highly commended: Anthony Tustain; John Choyce. Commended: Hy. Woods.

Red regents (twelve specimens).—First prize, 15s., Anthony Tustain; second, 10s., Mr. Sumner, High-street, Birmingham. Highly commended: C. J. Perry. Commended: John Choyce; John Lynn.

Paterson's Victoria (twelve specimens).—First prize, 15s., Geo. Mangles, Great Givendale, Ripon, Yorkshire; second, 10s., W. Birch, Barnacle, Coventry. Commended: Samuel Robinson, Shaw House, Melbourne, Derbyshire; Russell Swanwick, Royal Agricultural College Farm, Cirencester.

Skerry Blues (twelve specimens).—First prize, 15s., Anthony Tustain; second, 10s., John Choyce. Highly commended: Henry Woods.

Any other named variety.—First prizes 15s. each, John Choyce (Red Fluke); Charles Felton, Birmingham Nursery (President Lincoln). Second prizes 10s. each, W. Birch, Barnacle, Coventry (Climax); Sir T. Smythe (Lopstone Kidney). Highly commended: Hy. Woods (Dunbar Regents); Sir Wm. Heathcote, Hurley Park, Winchester (Scotch Regents); John Choyce (Nuncaton Seedling); Wm. Birch, Barnacle, Coventry (Early Rose); Sir F. Smythe (American Red Seedling); Chas. Felton (Erdington Nonsuch). Commended: Anthony Tustain (No plus Ultra); Joseph Greatorox, Stretton (Red Kidney); Thos. Barnett, Walford, Herefordshire (Forty-fold); C. J. Perry (Edgecote Seedling); C. J. Perry (Red Emperors); Zach. W. Stilgoe (British Queen); Thos. Barnett (Paterson's Oxon).

CARMARTHENSHIRE FARMING.

At a meeting of the Carmarthenshire Farmers' Club, Mr. J. Lewis Philipps, Bolahaul, in the chair,

Mr. D. P. DAVIES, of Troedybryn, said: The district represented by the members of this club, geologically speaking, rests on the Upper Silurian, Lower Silurian, old red sandstone, limestone, coal-measure, and millstone grit, but the principal extent is on the Upper Silurian; and, however much the strata or the physical contour of the country may differ, there is one thing that affects us similarly—viz., the climate—which might be termed humid, because our valleys open to the S.W. to receive the Atlantic moisture, and our hills intercept it, and which collects in rain and descends in torrents, more especially on the eastern declivity. The climate to some measure might be improved, for draining has risen the temperature of some soils in this district nearly 15 degs. So, whoever intends to develop the capabilities of his land, must drain thoroughly, cultivate deeply, and return to the land the inorganic portion of his crops. And as plants obtain from the constituents of air and water only carbon, oxygen, hydrogen, and some nitrogen, the rest of their components—namely, all the mineral substances and the greater part of their nitrogen—must be supplied by the soil they grow in; and, as the life and development of an organic being cannot be regarded as depending on chance, for the same kind of plants require similar food in nearly the same quantities, it is evident therefore that, by continued cropping of the same soil by the same tribe of plants, without returning their mineral food to the land, the most fertile soil must ultimately become exhausted of the aliment necessary for that crop. Although the soil is no longer capable of producing remun-

erative crops of one kind, yet it might produce excellent crops of other kinds of plants having different demands on the soil and different habits of growth; for instance, the clover is introduced into the rotation because it is a plant capable of sending out roots to a great depth and distance in the soil in search of the materials of its structure, consequently it is highly useful for collecting together the small quantities of valuable materials scattered throughout a large bulk of soil. The surface is thus enriched and becomes better adapted for the growth of those classes of plants which, from the rapidity of their development, and for other reasons, are unfitted for searching extensively for their own food. Advantage ought to be taken in practice of the above facts by cultivating plants of different habits and requirements alternately; but no system of rotation, however complete or carefully carried out, can maintain the fertility of the land unless the mineral substances which have been abstracted from it in the crops carried away be restored. The following calculations show that the most prevalent system of farming is one of exhaustion; for instance, a farmer who cultivates his land in the ordinary way, and returns to the soil all the straw, hay, and green crops in the shape of manure, must be told that, although apparently he keeps up the fertility of his soil, such is not the case. I do not mean that farmyard manure, as far as it goes, does not restore fertility in a perfect manner to the land, and so enable it to produce the maximum amount of crop. For every two-year-old cattle of his own rearing such a farmer sells, he robs his land of no less than 120 lbs. of phosphate of lime, to say nothing of the valuable constituents of the flesh, blood, &c., which if burnt would give ash similar in composition to the

ash of plants. To make up this yearly loss in phosphates it is necessary to return to the land no less than 5 cwt. of guano, or some other auxiliary manure that would supply the deficiency. Again, let us calculate to what extent the dairy produce robs the soil. For every cwt. of cheese sold the farmer alienates 6lbs. of bone material, about 7½lbs. of nitrogen, and about half a pound of sulphur. The loss per acre by selling wheat (see Liebig's Modern Agriculture, page 218) is 28lbs. of ash constituents, of which 13 3-5ths lbs. is phosphoric acids, and 8 2-5ths lbs. is potash. Now these losses cannot be supplied by guano or superphosphate alone, for the proportion of potash in them is too small, but by mixing those manures with wood ashes the deficiency would be supplied. Let us then sum these losses and calculate what would be the total yearly loss of indispensable measures on a farm capable of producing for disposal five acres of wheat—grain produce. The produce of ten milch cows, ten two-year-old cattle weighing about 120 lbs. per quarter; therefore, according to the most modern data, a supply of 60 cwt. of pure Peruvian guano would be necessary to keep up the fertility of such a farm, provided of course that all the manure resulting from all the hay, straw, turnips, &c., produced be wholly returned to the soil. We say wholly returned, because on most farms in the district large quantities of the farmyard manure are wasted; in fact, the essence of the manure heap is often seen running away in that small continuous black stream into an adjoining brook or into other places, and lost to the farm. Having laid down my principles of farming, I will now proceed to discuss the practical details, and, as an illustration, I will take a farm of 100 acres, of ordinary quality, divided into 20 fields of five acres each, with a suitable and commodious homestead centrally situated. The stock on this farm should consist of two draught horses and a hackney, with occasionally another pair of stout horses, in order to be able to subsoil one field every year. One bull and ten cows of the black or any other approved pure breed, ten yearling cattle, and ten calves, 25 ewes and a ram of the Shropshire, Cheviot, or Cotswold, or whichever breed might be deemed most suitable; a breeding sow of the small breed, and a quantity of poultry. Half of the farm should be permanent pasture and meadow, and the other half or ten of the driest fields might be advantageously managed under a ten years' rotation as follows: 1st, oats; 2nd, vetches, peas, potatoes, mangold, and carrots; 3rd, wheat; 4th, turnips; 5th, oats or shiprys; 6th, barley; 7th, seeds; 8th, grass; 9th, grass; 10th, grass. I fancy that some may object to barley after oats; to them I would say forbear till I have explained myself, for I think they will agree with me that a finer sample of barley and better seeds would be the result of this plan than if barley with seeds had immediately followed turnips. The management of the different crops would be thus, viz.: 1st. Oats dressed with two tons of lime per acre, mixed with soil, and applied previous to ploughing, and the ploughing should be well done by a man and a pair of horses, followed by furrow presser, which leaves the land in ridglets ready to receive the seed. 2nd. Vetches, peas, potatoes, mangolds, carrots, &c., heavily dressed with dung, receiving at least two ploughings and the necessary cultivation. 3rd. Wheat, or "shiprys" if the land will not carry wheat. 4th. Swedes and turnips drilled in with 5 cwt. of Lawes' manure. Half of the turnips and swedes should be consumed at the homestead, the other half should be eaten along with their daily feed of cake and corn, with an allowance of hay, grown lambs and drafted sheep having a pound or a run to a field of grass adjoining. In order to manure the land evenly, two alternate rows of swedes and turnips should be the half left for consumption in the field. 5th. Oats, or a mixture of oats and barley, called "shiprys" 6th. Barley with seeds, 2 tons per acre of lime having been ploughed in on the oat or "shiprys" stubble the previous autumn, and the good effects of this dressing in the barley seeds, and the subsequent grass crops will be very satisfactory. 7th. Seeds to be eaten in spring by the ewes with twins; after weaning time by the lambs till they are removed to the clover stubbles, preparatory to being put on the turnips. 8th. Grass to be grazed by sheep. 9th. Ditto. 10th. Ditto. The next consideration will be the management of the remaining ten fields which are in permanent grass. Four of the nearest fields to the homestead will be required for the summer grazing of the milch cows, and the lattermath of two hay fields. Two of the most distant of the permanent pasture fields will keep the 10 yearlings, with the help of the lattermath of the other two hay fields.

Two, out of the ten fields in permanent grass, should be annually dressed with either a mixture of lime and earth, or dung compost, and four of them alternately mowed and grazed. A good deal of the compost might be made in the shelter sheds that ought to be in every grazing run, otherwise the cattle will run off their flesh before gaddies, and waste their droppings by polluting the water in their fields. The horses are to be in the house, fed with a mixture of split oats, cut straw and hay, with a little carrots, or gorse, or vetches in addition, according to the season, till harvest, when they might be turned out to cool their feet, and clean after the cows and yearlings, which are by this time commencing the oddishes; besides, all grass lands should be eaten quite clean once in the year, and the weeds eradicated. The calves should be in an open shed with a yard, eating vetches, hay, and a pound a day of cake, till they are about a twelvemonth old when they ought to be accustomed to the best grazing land on the farm, where they are to remain till they are sent to the lattermath, from thence to the feeding byres to be there furnished with a progressive allowance of turnips, meal, hay, straw, and some cake, till they are ripe for the butchers. If these cattle had the benefit of sucking their dams dry, as they most probably will do when the farmer is a bachelor, or, when the farmer wishes his wife not to be troubled with a dairy, they ought to pay a pound per month, but on the contrary, when they are weaned young, and their dams milked for dairy, there must be a reduction of one-fourth. The sow should farrow in September and March and the produce after being weaned kept in the manure yard which ought to be covered, and their food to consist of vegetable refuse, skim-milk and wash-thickened with from 3lbs. to 5lbs. of meal per day, or even more, according to size. The whole, except what would be required for the house, has to be sold off as porkers. The poultry having comfortable quarters will pay for all the care bestowed on them. The grand lesson to be remembered in breeding and feeding all animals, is steady and continued progression from birth to the shambles. As to the motive power of the farm, the principle is very simple, that is, never do anything with manual labour if it can be done by horse, and never by that power if it can be done by water or steam power. All the corn, except when the price is high for wheat, should be consumed on the farm in addition to about 5 tons of pure linseed cake. Besides, 80 cwt. of auxiliary manure and about 20 tons of lime should annually be used to keep up the mineral loss above alluded to. All the transactions on the farm should be carefully noted down, and a balance-sheet made at the end of the agricultural year. In conclusion I beg to thank you for your patience, and assure you that this is not an imaginary plan of farming, and I feel confident that if it became general the aspect of the district would present as beautiful and productive an appearance as the most sanguine member of this Club would wish to behold; and it is the earnest wish of the introducer that this paper may contribute its quota to general amelioration of this peaceful country.

Mr. Lewis (Llwynfedwen) said he could not follow Mr. Davies' observations minutely and point out all points where he disagreed, because he had not taken any notes, but he might state that he believed there should be three systems for this country—one for the high land, one for the middle land, and one for the low land. Of course that was his opinion. It was well known that they had different courses of husbandry, and what would do for clay soil would not answer for shallow land, or a gravelly soil. He was not in a position to state his opinion as to the correct system to be adopted, and he agreed with part of Mr. Davies' remarks as to the cropping of a 100 acre farm, though not as to the course of cropping proposed by that gentleman. He would not tell them what course he himself would adopt, but he would not advocate Mr. Davies' system. One part of the paper he thoroughly agreed with. As Mr. Davies had said, to be a successful farmer there ought to be good buildings, and he was glad to say that one noble lord, a large owner of property in the county, had introduced good buildings on to his farms—but he was sorry to say that other landowners had not followed so good an example, for he was certain that no person could farm well unless he had a proper homestead. While on this point he would mention that some time since a prize was offered for the best plan of a homestead; there were seven or eight competitors, and he had the prize plan with him. The successful competitor, Mr.

Davies, of Pumpsaint, was not a professional man, but the plan was a very good one.

Mr. HUGHES (Castellddu) said Mr. Lewis had thrown out a hint of a different system to that suggested by Mr. Davies, and which he (the speaker) thought a bad one; for there was one objection to its being carried out—a tenant farmer could not undertake a ten years' course of cropping unless he had a 14 years' lease.

A Voice: Or a lease for 21 years.

Mr. HUGHES said that would be better still. At present farmers were very liable to be turned out of their farms, especially for one reason which they all knew—and they must have leases before they could venture on a ten years' system of cropping. Mr. Davies' theory of farm management was a perfectly sound one, though he went further than Mr. Davies in one matter. In his paper he said that calves should be kept in until they were a year old, but he thought farmers should keep them in until they were ready for the butcher.

Mr. HARRIES (Llandilo-Abercowin) said he pursued the five-course system of cropping, and he fancied it answered better with him than any other. He began with wheat, went on to barley, then to turnips, then to seeds, and then returned to wheat again, and he had successfully worked this system for 10 years.

Mr. JONES (Dirwydd) should say that the best mode of farming was to farm to some profit; though agriculture did not lead to great fortune. He had been farming for 45 years without making a fortune, but he knew persons who had entered into business at about the same time as he started farming, and they had retired with very ample fortunes; while the farmers who had made fortunes were very few and far between, and he was not one of them.

The CHAIRMAN: How did you portion your children?

Mr. JONES: Well, not out of the profits of farming. In continuation he said, that when a person took a farm, the first thing he ought to do was to drain his wet land if he had any, and then he ought to arrange which of his fields were to be pastures and which arable lands. He never heard of the ten-course system before; but he had tried the four-course system on light land, and it did not answer, and ever since he had followed the six-course system for twenty-six years. He commenced with the principal item—turnips—and he might here say that he would not recommend anybody to grow turnips if the land was not clean. For his part he would rather lose the rent and taxes of a field for a year, and let it lie fallow, than sow turnips in a dirty field. But to continue. In the second year he sowed barley with bone manure, and in the third seeds. In the fourth year he laid down grass, in the fifth wheat, and the sixth oats. When the crop was gathered, he then ran the plough through the land, and then it was ready to begin the course again. He fully agreed with Mr. Davies, that a farmer ought to feed his calves well, and keep them in creating flesh until they came to the butcher. They should be especially well attended to in the first year. He had now told them what he had done, and he thought if they did likewise they would get on, though he had not made much profit.

Mr. MORGAN (Llwyn) said there were some things in the paper which he did not agree with, and he did not see how a man could work fifty acres of land with only two horses; because in an ordinary farm, when sending manure to the fields, a farmer would never like to have less than two carts going, and to each cart there would be two horses; indeed sometimes three.

Mr. DAVIES: I said five.

Mr. LEWIS said he understood that Mr. Davies spoke of five horses.

Mr. MORGAN: I thought he said two constantly, and occasionally two more.

Mr. DAVIES said that he advocated the keeping of two draught horses and a hackney, and occasionally another pair of cart horses.

Mr. MORGAN: Then I must take it for granted that there are five horses on the farm, two of which are always at work. I am satisfied on that point. With regard to the ten cows, ten calves, and ten yearlings, he thought Mr. Davies had not over-shot the mark; an ordinary farm would support that number; but as regarded the sow which was to breed twice in the year, he must say that the farmer would be very neglectful if she did not breed oftener than that. Another fault he had to find was, that in speaking of his farm, Mr. Davies appeared to take it for granted that the land was ready for

tillage. They had not heard anything about draining, the cost of draining, the best mode of draining, or whether draining was profitable. As to the ten-course system, he had not heard of it before. Mr. Jones went for the six-course, and he (Mr. Morgan) was laughed at when he read a paper on the four-course system, even more than Mr. Davies had been; but his idea was, that if they observed a happy medium they would be near the mark.

Mr. BUCKLEY (Penyfai) said in this district they had chiefly the Silurian, then the old red sandstone, and mountain limestone, and then came, to the south or south-east of which they might say Llanelly was the capital, the mineral district. Now he would suggest that these different soils required different courses of treatment, and he thought that the system Mr. Davies had propounded was rather too inflexible, and that though it might, and no doubt did, suit one of these soils, it would not suit all; it was rather too rigid. More than half of this county was on the Silurian strata, and the soil contained a good deal of lime, so that it would not require all the lime as manure that the lecturer spoke of. The limestone part would only require the addition of lime to the soil under peculiar circumstances. Then in the coal district there was scarcely a trace of lime, and there the land would take any quantity with advantage. The speaker then proceeded to argue in favour of an alternate system of green crops and corn, and said he thought all systems of about the same value as long as they were alternate. He noticed that Mr. Davies' system was an alternate one, except where barley came after oats. Now he did not believe in a corn crop for two years running, as he was afraid of deteriorating his land; he was always anxious to keep it at cropping point. As had been very judiciously remarked, there was an influence which bore upon the soils in this west coast, and that was the moist, wet, and at the same time exceedingly mild climate, a climate that would only very exceptionally indeed give us anything like a good crop of corn, or the opportunity of getting a late harvest. Last summer was one of those exceptional years, and he supposed we had the best corn harvest ever known. In England that had not been so, and the harvest on light land in the Eastern and Midland counties had been light and poor. But this same mild, moist climate, which generally gave us such poor crops of corn gave a most invaluable, most excellent crop of roots and green crops. Then these circumstances of soil and climate, what did they direct us to? His answer was that they should only grow roots and green crops. The climate should also lead them to improve their pastures and meadows; they should drain them, and if they did so they would have their excellent black cattle in far better condition, and a far greater number would be sold at the spring and summer fairs than was the case at present.

Mr. HUGHES (Castellddu): They would be of better quality.

Mr. BUCKLEY agreed with Mr. Hughes and said they would not then see, as they did now sometimes, a farmer standing with a few miserable steers which he often had to take back unsold, but he would be able to ask whatever price he liked almost, and the drovers would buy them. That was the course they had to pursue, for their moist climate would allow them to graze their cattle until Christmas, and they would have to expend more capital, but who thought of going into trade with insufficient capital if he wished to get on?

Mr. MOSLEY said with a deal of what Mr. Davies had put forth he agreed, but with some portions of the paper he must find fault as other speakers had done. He believed that although the rules laid down might be very good ones for certain climates and certain districts, yet in this country, the climate of which varied so much, one system would not apply to all the districts. As Mr. Buckley had said they wanted more money among them, and a good system of drainage, a judicious system of manuring, and a good system of cropping afterwards. He would not any longer trespass on their time when there were so many practical men present more able than he, and he would sit down thanking them for the patient hearing they had given him.

Mr. PROSSER (Tygwyn) asked whether it was possible that they could exhaust land with such a quantity of lime and superphosphate as that mentioned by Mr. Davies?

The CHAIRMAN replied in the negative.

Mr. BUCKLEY remarked that he did not use anybody's superphosphate; but he put 100lbs. of dissolved bones per acre on his land.

The CHAIRMAN said he objected to the ten-course system, for he looked at it as nothing but a seven-course system with three bad endings. He hoped all condemned three grassing years out of ten. If they adopted the four-course system, they must have an enormous quantity of manure and good land: the five-course system took less manure and less capital, but the six-course system he thought the best. He had tried it for twenty years, and found it answer. He would say nothing about his crops, because he thought all had had good crops this season; but what had been a good year in Wales had been a bad one elsewhere. He thought Mr. Davies was wrong as to the number of horses necessary to work a farm of the size he had named. A farmer ought to make himself independent of his neighbour, and it would never do for him to run about after an extra team of horses, and what was more, a man could not always command horses when he wanted them. He hoped they would not run away with geological systems of farming, for he thought the right system was to examine the peculiar character of each field. In the same farm might sometimes be found clay, gravel, limestone, and peat; and, without paying too much attention to geological formation, farmers should look closely to the texture of their fields, and manure accordingly, without reference to the strata in the neighbourhood. His advice to them was to take care of their fields, pay attention to the rotation of their crops, and the state of the farm would tell them how many cattle they could keep. In conclusion he recommended the cultivation of rye instead of vetches as being much more profitable.

Mr. BUCKLEY thought farmers would find rye pay as well as wheat if not better.

Mr. DAVIES thought he had been misunderstood in his remarks about lime. What he said, or at any rate meant to say, was that he used four tons per acre for each rotation, mixing it well in with the soil; but he would add that two tons used properly would be of more value and would have greater effect than if six tons were not used properly. Mr. Morgan (Llwyn) wanted to know what he would do with his cows, and his reply was sell them from time to time, taking care to keep up the supply. With regard to the number of horses he had not been understood. What he said was that a farmer should keep five horses if necessary, but if the farm was not a hilly one three would be sufficient. He did not propose that farmers should borrow their neighbour's horses when they wanted an extra team; but he thought if he had a field to subsoil he would rather purchase a pair of horses and sell them again, even at a loss, than keep a team that was idle the best part of the year. He was surprised Mr. Jones and Mr. Morgan said they had never heard of a ten course system of cropping, but it only showed they had not read Mr. Sewall Read's report to the Royal Agricultural Society as to the best system for Wales, wherein he said that the most permanent and best for this part of the country was the ten course rotation.

Mr. BUCKLEY: Who is he?

Mr. DAVIES said Mr. Read was a Norfolk man, but he had lived in Wales a very long time.

THE GROWTH OF FLAX IN IRELAND.

At the monthly meeting of the Ballineen Farmers' Club, Mr. CLARKE said that in consequence of the great quantity of flax which had been grown, there was much difficulty experienced in getting it scutched, and the consequence was that the farmers could not dispose of the crop. He tried throughout the whole county to get flax scutched, but it could not be done until at this side of the 1st of June, which entailed great loss and inconvenience. He believed that this would lead to the farmers ceasing to grow flax in large quantity, for it was a perishable article, and unless they were enabled to get it scutched and disposed of within a reasonable time, how could they pay their rent and the many charges that were upon them? In all the mills there was more work than could be done, and his idea was that in every parish a scutching mill should be erected. He trusted that Lord Bandon would make such a representation on the point as would secure the erection of more scutching mills in the county.

Colonel BERNARD said that there had always been a great uncertainty as to the quantity of flax that would be grown. They never could depend on the amount of flax that would be sown, but he was in hopes that the good prices being realised would lead next year to a large supply. If that proved the case, there was no doubt that there would be scutching mills erected, but the great want of them at present had been truly stated by Mr. Clarke.

Lord BANDON said he was glad Mr. Clarke had come forward to state the want that existed. What was really wanted was that some intermediate parties should come forward and scutch their flax for them. If they did so the farmers were prepared to grow the flax, and if that was done and the home trade supplied, they would keep £1,600,000 a year in the country which at present went abroad. He was happy in being able to congratulate them on the large quantity of flax brought into the market that day. He understood there were about 140 cartloads of it, representing between 7,000 and 8,000 stones, which, disposed of at the prices of the day, would realise about £3,000. Considering the size of the place, and that the flax market there was but a beginning, he thought that state of affairs very encouraging. They should also bear in mind the great want of water that they had experienced, and probably the next fair would show a still larger quantity of flax. As far as he had been able to learn from the

gentlemen who were present from the north of Ireland, the prospects of flax growing and the flax trade were likely to be much better next year than they had been hitherto. The present dreadful war had in a degree paralysed the trade, and had it not been for that, he believed that new flax would be realising 1s. per stone more than it did. They hoped that peace might be made before long, and then a reaction would take place in the great demand for linen by Germany and France. Again, their not being able to grow flax themselves gave every encouragement to the farmers of this country to cultivate this crop, and next year they might depend on a good market for it. There were one or two matters that he wished to mention to the meeting. It had been complained to him by some parties in the north that a practice existing there was finding its way into the south—that was, that buyers went to the scutch mills, picked up the best of the flax, and bought it up, leaving the inferior quality to come into market like that. Now, in two ways that was injurious—first, because the farmer did not get as good a price as he otherwise would for his whole flax; and, secondly, that unless there was a good supply at market, they could not have the advantage of the northern buyers coming down and spending their money amongst them. These were evils that could be corrected only by the farmers themselves. They could get their flax scutched wherever they pleased, but they should retain the whole of it for market, where it would be open to competition. Another matter he was anxious to call attention to was the assistance that had been given for flax instructors throughout the country. At the agricultural dinner at Ballinasloe, the Lord Lieutenant spoke highly of the advantages that had been gained through the advice given by the flax instructors, and one thing would be most desirable, that if the grant, as he (Lord Bandon) hoped it might, was retained, the flax instructors might be sent to their several districts at as early a period as possible, and thus be able to give advice to the farmers as to what portion of their ground was best suited for flax, and the manner in which the crop was to be treated. He believed the grant would be applied far better if it was given through the agency of the flax association of Belfast, assisted by any local committees they might name, than through the joint co-operation of the Royal Dublin Society and the Agricultural Society of Ireland.

THE FOOT-AND-MOUTH DISEASE.

At the first meeting of this session of the Breconshire Chamber of Agriculture, Colonel Bridgwater in the Chair, Mr. FERRIS, V.S., read the following paper: This disease is of great importance, for its ravages are but too apparent in many parts of the country. I propose to explain to you in some measure the nature of the disease, to tell you the signs by which it may be known, and in conclusion to make a few remarks upon its treatment and prevention; and I hope what I say will prove sufficient to provoke a discussion interesting to all. I shall read extracts from, and found my remarks chiefly upon, an essay lately written by Professor Brown. Foot-and-mouth disease is now generally known by that name, although various other names are employed in different parts of the country, such as eczema, epizootica, murrain, vesicular epizootica, and distemper. It first appeared in England in 1839, and since that time it has never been thoroughly eradicated, though through what channel it was conveyed to our country has never been satisfactorily ascertained. This disease was said to be in Holland at that time, from which date no foreign cattle were permitted to land in this country until after June, 1842. One fact only in reference to its origin is incontestable, namely, the prior existence of the complaint on the continent, but whether it was brought by individuals, animals, substances which had been in contact with infected foreign cattle, or in obedience to that unknown law which regulates the cause of many epidemic and epizootic diseases, has never been proved. In the beginning of the year 1840 the Royal Agricultural Society of England took action for the purpose of obtaining information respecting the nature and treatment of the disease. The Veterinary Committee of that day, in concert with the late Professor Sewell, drew up and forwarded to each member a circular, dated April 8th, 1840, giving a short account of the symptoms by which the disease might be known, and offering some suggestions for its treatment. That the disease referred to in the circular was in all essential particulars the foot-and-mouth complaint, will be evident from the following description. The attack does not always commence in the same form, but ultimately terminates in a disease of the same type and character. In some animals it commences in the feet between the claws, and in others it appears to have begun in the mouth; in others a stiffness in the legs of the animals is first perceived, as if treading upon thorns and briars; then follows a discharge of saliva from the mouth, and a champing of the lips. The blisters peel off, and loss of appetite and general debility ensue. The treatment recommended by Professor Sewell included attention to the animal's comfort, laxative medicine, followed by tonics, astringents, lotion for the mouth, and to the diseased feet poultices, and afterwards styptic solution. This circular was followed by another, dated 1841, requiring information respecting the extension of the disease, and the various conditions under which it appeared. The results of the inquiry were published in the Society's journal the same year. During the progress of the disease it was observed that animals of various kinds which were exposed to the infection suffered from its effects; not only cattle, but also sheep and pigs were attacked, and in many instances poultry did not escape; sheep were most severely attacked in the feet, and loss of the horny covering of one or more of the digits was not an uncommon occurrence. After a market at Smithfield it was frequently necessary to sweep away the hoof which had sloughed off the feet of diseased sheep especially, but also occasionally of pigs and oxen, while they were exposed for sale. The admission of foreign stock in 1842 was not attended with an increase in the number of attacks; indeed it is fair to conclude that the malady declined from this time to 1845, when it again became prevalent. Its progress has not been uniform in extension nor virulence. Some years have been rendered remarkable by its unusual violence, and at others by its light form. In the year 1862 it assumed a character of great severity in this county, and some few animals died of the disease. Since 1862 there have been only a few light cases in this neighbour-

hood to my knowledge. It is stated that at the time of the cattle-plague, when the restrictions upon cattle traffic were carried into effect, that foot-and-mouth disease and pleuropneumonia declined; and when the imminence of the danger caused by the cattle-plague led to the almost total stoppage of fairs and markets, and the movement of cattle all over the country, these diseases almost ceased to exist, or at least assumed proportions which prevented them from being especially observed. Recently the malady has spread with remarkable rapidity in this country. The *Veterinarian*, of October, 1870, says: "We have again to report an increase in the spread of the foot-and-mouth disease. The malady prevails in 45 counties of England and Wales and 10 in Scotland. The largest number of infected places are reported from Cheshire, Cumberland, Dorsetshire, Lancashire, Somersetshire, Staffordshire, and Yorkshire; the total number of centres of infection being nearly 4,000. In Ireland also the disease is spreading, more especially in those districts where opposition is offered to the enforcement of the provisions of the law. It would appear, however, that in some of the English counties the local authority is about to adopt more active means to check the spread of the disease. In Dorsetshire a desire has been expressed that steps be taken to stop the fairs and markets. Compared with last month very little alteration has taken place in the number of counties in which the foot-and-mouth disease prevails; and although the centres of infection have decreased in some of them a great increase has taken place in others. This is especially the case in Somersetshire, which now heads the list, with upwards of 1,500 centres of infection. The returns also from Cumberland, Dorset, Hants, Wilts, and Yorkshire are still very heavy. At no period, however, has its spread been more rapid than during the last few months." Eczema, or foot-and-mouth disease, is an eruptive fever, affecting cattle, sheep, pigs, and poultry. Contagion is the common cause of the diffusion. The period of incubation is from one to four days. During this time the temperature is increased, and finally the formation of vesicles or little bladders on the mucous surface, and those parts of the skin thinly covered by hair, takes place, and the vesicles appear in the mouth and tongue on the udder between the digits. In some cases complete separation takes place between the hoof and the more sensitive tissue. Under ordinary circumstances the disease is not fatal in character. A considerable fever is present in the early stages; but as soon as the vesicles are formed it subsides, and convalescence is established in six or seven days. When the malady assumes a virulent form the results are more serious, consisting of ulceration of the mucous tissue of the mouth, formation of abscesses and in other parts of the body, sloughing of hoof and extreme debility and emaciation. The losses in this malignant form of the disease amount sometimes to 20 per cent. of the animals attacked. Milk from cows and sows with this complaint given warm occasionally destroy sucking calves and young pigs. It has been alleged that there is not any direct evidence of injurious consequences arising from the consumption of the milk or meat by human being. The milk is generally allowed to become cold before used, and the meat is cooked previous to human consumption, which probably destroys the morbid matter in the blood. Experiments have been made in which hay saturated with infected saliva has been introduced into the mouth of a healthy animal. This has caused the formation of vesicles in the mouth and feet of the previous sound animal within 40 hours. These observations are useful in showing the short time this disease is in the system prior to its development. Inoculation by puncture and introduction of the contents of vesicles failed to produce any effect in cows, sheep, and pigs. The symptoms are very characteristic. A person who is familiar with cattle will at once recognize this affection by the general aspect of the animal. Stiffness or lameness, discharge of saliva, and a peculiar smacking of the lips, are indications which are unmistakable, but the observer will also distinguish other and not less cha-

characteristic symptoms. At the commencement of the affection the animal is dull and inclines to stand still, with the back arched. In some cases the hind feet are snatched up suddenly and shaken as though to get rid of something which annoys, and the appetite is impaired. In a few hours of illness vesicles or little bladders will appear in the mouth accompanied with a drivelling of saliva on the teats or udder rendering it hot and tender, between the claws causing lameness, while in milch cows the secretion of milk is diminished. These symptoms may be slight or severe. In the mild form of the disease the morbid action subsides in a few days, the vesicles burst and discharge their contents, and the abrasions are quickly healed; the lameness ceases; the milk and appetite return and soon recover the lost condition. This epizootic disease is of many degrees of intensity. The amount of suffering endured is often excessive in a severe form of the disease, and the animal is a pitiable object. The mouth and tongue become studded with sores, partial or complete separation of the hoof takes place, and ulceration of the tissue extending to the bones, causing open joint, and at times the legs and other parts of the body swell from effusions in the cellular tissue beneath the skin, and abscesses form in the udder of a very unhealthy character, accompanied with a low fever and extreme debility, which continue for a time, and in some cases end in death. Now, as to treatment. This complaint runs a fixed and determinate course. The eruption can not safely be arrested, and therefore the principle to be followed is to avoid unnecessary interference beyond supporting the system by giving soft, easily-digested food, such as mash of bran and linseed, pulped roots, grass, or gruel. Bleeding and purgatives are very injurious. Small doses of nitrate or bicarbonate of potash may be given when the fever is severe. When associated with other diseases, or any unfavourable circumstance, the complaint often assumes a virulent form, in which case the aid of the veterinary surgeon is required. Now as to preventive measures. It is obvious that the first essential is the separation of diseased or infected animals from those which are healthy. It may be true, at least need not be disputed, that restriction to the free movement of animals is contrary to the interests of commerce. It is, on the other hand, undoubtedly true that free movement of infected animals means unlimited extension of disease. Movements in any direction along roads or railways, for any purpose, must be associated with the propagation of the infection to a greater or less extent, depending upon the precautions which are used. On premises where the disease exists disinfectants should be freely used, and the most exact care should be exercised in removing all excreta, which should be mixed with quicklime in equal proportion. The selection of the method of disinfection is probably of less importance than the previous adoption of a complete process of cleansing sheds and places where diseased animals have stood, by means of washing with hot-water, containing common soda in solution, after which carbolic acid, chloride of lime, or zinc, or sulphurous acid gas, may be employed to complete the process.

Mr. D. DOWNES said Mr. Ferris had not exactly given them the remedies he should wish to hear.

Mr. OVERTON: Yes; he has told you that the best thing is to send for a veterinary surgeon (a laugh).

Mr. D. DOWNES recollected a good many years ago his animals were suffering from the foot-and-mouth disease. The first symptom was lameness. The animals were not able to stand, and they had blisters upon their mouths. The remedy suggested to him was a solution of alum to be applied to the tongue and udder and between the claws. He carried out this suggestion. He hoped that some of those present would be able to give them some information.

Mr. OVERTON asked Mr. Downes if the remedy he had named succeeded.

Mr. DOWNES replied that it did. He did not lose an animal.

Mr. FERRIS said he thought it was a rare disease for quacks to deal with. The solution of alum was not poisonous, and, therefore, it would not poison the animals; but if they were left to nature they would get on better than they would with medicine of that sort.

Mr. DOWNES: The remedy then was to give the animals opening medicine, salts.

Mr. FERRIS observed that in the year 1862 the disease was said to have been brought in by cattle from Herefordshire. He thought that there was great danger in cattle coming from an infected district.

Mr. DOWNES said he had understood that the disease was brought at the time referred to by Mr. Ferris by a drove of Irish cattle travelling through the county.

Mr. CORNISH asked Mr. Ferris if he thought it was likely that a person who had been in a shed with diseased cattle would carry the disease?

Mr. FERRIS said that this had not been proved in connection with this disease. In the case of some diseases persons were more likely to carry it than in this.

Mr. CORNISH: But did he think a person might carry this disease about?

Mr. FERRIS replied in the negative, and observed that the saliva was the most poisonous. It was infectious, but not, he thought, to the extent Mr. Cornish had spoken of.

Major CONWAY LLOYD: But it was highly contagious.

Mr. FERRIS: Yes.

Mr. DOWNES said he was sure that they were all much indebted to the magistrates of the county of Brecon for so actively doing that which that Chamber had suggested upon several occasions. But in his private opinion a resolution which would prevent the Herefordshire cattle coming into that county was uncalled for. It would materially interfere with the county of Brecon. From that time to the spring of the year many of them would be going to Hereford. They would want bulls and different animals. Now, if they passed such a resolution they would not be able to move an animal. He thought they ought to look to the Government to do more to prevent the disease from spreading over the country. There should be greater restrictions with respect to the importation of foreign cattle.

Mr. REES WILLIAMS (Scethrog) pointed out that a man might send ten or twenty animals to the Hereford market, and they might stand next to a lot of animals infected with the disease. A sale was, perhaps, not effected, and the cattle were taken back to that county. He thought the best way was to take the bull by the "nose," because "prevention was better than cure."

Mr. A. SMITH, after stating that he had had some experience of this disease in sheep, asked what was the cause of the inflammation? Was it the cold? Or were sheep in a bad condition more likely to take the disease than those which were in good condition? Would warmth and good feeding prevent it?

Mr. OVERTON said that he should like to add that he had some conversation with a gentleman who had a large farm in Norfolk, where they had suffered a good deal from this disease. He asked him whether he could attribute it to anything. He replied that he had found that it came on about the autumn, and that he thought it came on when there was a good deal of fog. They were subject to heavy fogs, and there was an impression that they had something to do with it. This idea might be of use to them, or it might not. There might be something in it.

Mr. FERRIS, in reply to questions which had been put to him, said that during the time the morbid matter was in the blood the animal was feverish, as Mr. Smith had said. He was not going so far as to say that the sheep, being in a good condition, were less liable than those in a poor condition; but there were circumstances in which they were more liable to take the disease. For instance, they were more liable to take it when travelling; also at the time of parturition and lactation. He thought that fat sheep were just as liable as poor ones. The best preventive was to take great care that the animals did not come in contact with those which were diseased. If they sent their animals to the market of a county in which the disease was, their cattle might stand by those which had the disease, but did not show it; and if the animals were brought back to the county they might bring the disease with them.

Major CONWAY LLOYD said after what he had heard that day he did not think it was necessary for them to pass any resolution to bring before the Quarter Sessions.

There was some further incidental conversation amongst the magistrates present, but this was of little weight.

THE CHEMISTRY OF FEEDING STUFFS.

At the first meeting for the season of the Botley and South Hants Farmers' Club, Mr. William Warner in the chair, the subject for discussion was "The Chemistry of Feeding Stuffs and the Value of their Constituents," introduced by Mr. Albert Spooner.

Mr. A. SPOONER said: The dry season just passed having occasioned such a scarcity of food, particularly in the form of hay, induces me to take "Feeding Stuff" as appropriate for a paper at the present. However, I must first entreat your indulgence for the many faults and imperfections it contains, perhaps more excusable on account of its being my first. In order that we may dispose of the various sorts of food at our command to the best possible advantage, and to supply each kind of stock, as far as we are able, with the best food suited to its peculiar requirements, it is very desirable that we should have a clear knowledge of the various objects to which the nutriment derived from food is applied in the animal economy. We must first therefore consider the principles that exist in food, and the effect they have on the animal system. These principles are divided into two classes—the "proximate" and the "ultimate." The ultimate principles of food are composed of mineral or inorganic matters, which mostly consist of phosphate of lime and magnesia. They form the ash after burning; hence they are sometimes called the ash constituents. These mineral matters tend to the formation of bone in the animal system; in fact, they supply every part of the body with their earthy constituents. The proximate principles are furthermore divided into two classes—first, into those principles which consist of three elements, viz., carbon, hydrogen, and oxygen; and, secondly, those which consist of four elements, carbon, hydrogen, oxygen, and nitrogen. Carbon, in a separate condition, is a solid body, of a black or grey colour, as is seen in charcoal, soot, coke, and other substances of which it is the principal ingredient. It may also assume the form of a colourless, transparent stone, for the diamond, the most precious of our stones, has been demonstrated by chemical examination to be pure carbon. In like manner it changes colour and form, when it unites with hydrogen, oxygen, or nitrogen, for wood, starch, and sugar are not black, yet the half at least of these substances consist of carbon. It is in this form it exists in plants, for on subjecting them to heat, which drives off the oxygen and hydrogen in the form of vapour, a carbonaceous mass is left behind. Upon continuing the application of heat, with a free access of air, not only the colour is altered, but the solid form also, for the carbon, combining with the oxygen of the air, forms a kind of gas, which has been called carbonic-acid gas. The same thing happens in the putrefaction and decay of animal and vegetable matters, although by a slower process. Carbonic-acid gas is present in small quantities in the atmosphere, and is a constant product of respiration as well as fermenting liquids and combustion of all kinds. Oxygen in a free condition is an invisible gas, without taste or odour. It constitutes one-fifth of our ordinary atmosphere. Oxygen is not combustible—that is, it will not burn, but it is a powerful supporter of the burning of other bodies; for instance, bodies which burn in air burn with increased brilliancy in pure oxygen. Every one knows that fire cannot burn, that animals or vegetable matter cannot putrify without air. That property we owe to the air of maintaining and supporting those chemical changes is due alone to the oxygen it contains. Hydrogen, in like manner, is as invisible as when uncombined. It is very extensively diffused throughout nature, and from its extreme lightness was formerly used for balloons. Water is composed of hydrogen and oxygen, for if these two gases be mixed together, the sole product formed is water. And, again, by decomposing water, we obtain the gases. Hydrogen is combustible, but does not support combustion. For instance, a light is immediately extinguished when plunged into a jar of this gas. The hydrogen burns only when it comes in contact with the air. Nitrogen is also a gas, without taste, odour, or colour, and constitutes the great bulk of our ordinary atmosphere—viz., four-fifths. It is neither combustible nor a supporter of combustion. The pre-

sence of nitrogen cannot be easily shown, although it plays such a very important part in the composition of feeding stuffs. Class 1, that is, those principles which consist of the three elements—carbon, hydrogen, and oxygen—are called the non-nitrogenous or carbonaceous compound, and, with one or two exceptions, are also called respiratory heat-giving or fat-producing substances, on account of the part they perform in the animal system. Class 2, that is, those principles which contain, in addition to the elements just mentioned, nitrogen, are called the nitrogenous or flesh-forming constituents, on account of the function they perform in relation to animal life. The compounds which belong to the non-nitrogenous and fat-producing principles are the following: Woody fibre, or lignine, which is by far the most abundant of vegetable products, forming the bulk of most plants. It is almost useless as a feeding material, and is even objectionable when present in large quantities, since it passes unchanged through the animal system, owing to its indigestibility; hence the amount of this substance materially affects the value of feeding matters. However, as it exists in young plants it is digestible to a certain extent in the stomachs of animals, and seems to be as nearly as useful as the other members of this group. The rest of the compounds of this class are starch, sugar, gum, mucilage oil, or fatty matter. The greater portion of these compounds, which exist more or less in every kind of food used for cattle, when received into the system, become, as it were, the "fuel" necessary for sustaining the animal heat in the process of respiration. The breath of animals effect the combination between the combustible materials in the blood and the oxygen of the atmosphere, and, as in this process, a certain amount of heat is liberated, the requisite temperature of the body is thus kept up. These combustible materials, which may, with great propriety, in food, be called the animal fuel, are starch, sugar, and oil. The greater portion of food consumed by animals is required for the purpose of supplying heat to the body by undergoing oxidation in the lungs, in which process carbonic acid and water are formed, and pass off in the breath exhaled. When more of this kind of food is taken up by an animal than is necessary to sustain the proper heat of the body, that excess is stored up in the form of fat. It follows, then, that an animal confined in a small space, and consequently able to take but little exercise, soon gets fat, from the formation of this material of the food, that would otherwise be consumed by exertion. All of these respiratory compounds are capable of being converted into fat in the animal system, but with different degrees of facility. Thus it may be readily imagined that respiratory matter in the form of vegetable oil, as found in various seeds, is much more capable of being converted into that material than starch or sugar. This explains the superiority of the different oil-cakes in the fattening of cattle over other feeding stuffs. When food is deficient in these respiratory principles the animal system suffers from the want of heat. Moreover, unless a due amount of combustible matter is present in the body for the oxygen of the air to act upon, the surface of the lungs themselves are wasted by the oxygen of the air. We may therefore conclude that the non-nitrogenous or respiratory principles in food keep the animal body in its proper temperature, so that the functions are maintained, and any excess of these matters furnish the material for the formation of fat, but are unable to supply actual nourishment in the proper sense of the word—that is by restoring the waste the body sustains by exertion, and giving matter for the formation of flesh and sinew and other parts of the animal frame. To supply those deficiencies we must therefore have recourse to the nitrogenous or flesh-forming principles, the composition of which I have already mentioned. They exist in the choicer portion of all vegetable substances, and closely resemble a substance called albumen, or white of eggs, hence they are sometimes called albuminous compounds, of which are the following: Albumen, casein, gluten or vegetable fibrin, and legumine, as found in different substances. All these compounds are very much alike, and are considered equally valuable. Since, then, it is from the nitrogenous portion of

food the bodies of animals are chiefly built up and strengthened, it follows that the value of feeding matters are very materially affected by the amount of albuminous matter they contain, for the muscles and tissues wasted by exercise and fatigue are alone renovated from these materials. For this reason working horses require corn and beans in proportion to the amount of work they do, or otherwise their frames become wasted, and their strength diminished. We may, therefore, infer that the nitrogenous principles are the most valuable in food, but alone are totally incapable to support life. In conjunction, however, with the respiratory principles they form the proper food for cattle, such as Nature has ordained. Having discussed the composition of animal food, and the use of the various matters contained in them, in the animal system, we will now direct our attention to the various kinds and their relative feeding qualities. Linseed cake justly stands at the head of our feeding stuffs, and, if good and genuine, will contain about 11 per cent. of oil (although the greater portion has before been extracted from the seed), 28 per cent. albuminous or flesh-forming matter, 30 per cent. of non-nitrogenous matters, such as starch, sugar, and mucilage, 12 per cent. of woody fibre, and 5 per cent. of mineral matters. Linseed cake is, therefore, a very nutritive article, for it contains, in some cases, as much as 12 per cent. of oil, which constituent must be regarded as the most valuable of the respiratory form, occurring in oilcake from the fact that, having an abundance of other respiratory matter, in the form of starchy substances, which are sufficient alone to sustain the animal heat, the greater portion of the oil is converted into fat in the animal system. Ten parts of oil is usually estimated as equal to twenty-two parts of starch. The proportion of nitrogenous matter is, generally speaking, greater than that found in any other natural produce used as food. Mucilage is also very abundant in this kind of cake, which is considered a valuable constituent in food. This mucilage is very characteristic upon mixing oilcake with water, when it becomes at once very gelatinous, and is employed amongst other tests of judging the quality. Linseed cakes are made from seed grown in different localities, all of which possess the same qualities almost equally, provided they are free from dirt and other impurities. The only objection to linseed cake is its high price, which is governed not only by the demand and the supply, but also by the price of the oil. When the oil sells freely, and is in great demand it stimulates the manufacture, but when the market is slow it tends to increase the cost of the cake. Linseed cakes are often, at the present time, very much adulterated, sometimes with bran, which, although perfectly harmless as a feeding ingredient, diminishes the value of the cake. At other times starchy materials, such as rice dust and damaged grain, are occasionally met with. These inferior cakes are usually sold at a lower price than the genuine ones, although "farmers" are somewhat loath to think them at all inferior in quality to those of a higher price, but rather think you are endeavouring to "sell" them should you ask a higher price than they have before been offered for the adulterated cake. Rape cake, although formerly almost entirely devoted to the purposes of manure, is now extensively used as a feeding stuff. It does not differ very widely in general composition from the linseed. The following is its composition: Oil, 11½ per cent.; albumen, 30½; starch, &c., 28; and 8 mineral matters. Thus it contains a higher percentage of albuminous matters than linseed cake. However, it has a certain bitter taste, which somewhat lowers its merit as food. The chief objection to rape cake is its liability to contain the poisonous seed of oil of mustard, the presence of which can be detected by mixing a little with water and subjecting it to heat, when the smell of the mustard is very easily recognized. It must be borne in mind that mustard is present more or less in almost every sample of rape cake. Practice is, therefore, requisite in a certain degree to ascertain to what extent the presence of mustard is injurious. Foreign rape cake is the best, inasmuch as it is made from seed grown in the north of Germany and France, which is purer than the East Indian seed, from which English cake is usually manufactured. As its cost is about two-thirds that of linseed cake and its manuring value rather greater, it is valuable for growing stock. Decorticated cotton cake is a valuable feeding substance. It is prepared almost exclusively in the Southern States of America, where the thick husk can be profitably stripped off. The taste and smell of this cake are peculiar, and less pleasant than linseed cake. It contains

as much as 41 per cent. of flesh-forming element and 16 per cent. of oil, as well as a considerable proportion of phosphates, and must therefore be regarded as a very valuable feeding stuff, although the quantity of respiratory matter is rather low compared to other cakes. If the feeding value of food were entirely proportionate to the amount of these constituents they contained, we should bring the value of decorticated cotton cake higher than that of linseed, but as this holds good only to a certain extent, we must take into consideration the taste and smell of the article, as well as the amount of essential constituents, before being able to decide upon its feeding value. The manuring value of decorticated cotton cake, however, is fully equivalent to the high amount of nitrogen and phosphates it contains. It usually contains about starch sugar, &c., 31 per cent.; albumen, 23.7; oil, 6.2; mineral matters, 6.5. Common or undecorticated cotton cake contains rather a large amount of husk, and if given in very large quantities is rather hazardous on account of injury which may happen to the animals fed upon an undue proportion of that substance. Notwithstanding, it is a valuable addition to our feeding stuffs if used with care. Decorticated earth-nut cake is a sweet, palatable cake, extremely rich in flesh-forming constituents, containing as much as 40 per cent.; consequently its manuring value is high. It is produced from a nut found in Africa, after the extraction of the greater portion of its oil, which then leaves about 7 per cent. in the cake. Palm-nut cake is a useful feeding material, particularly for pigs. It sometimes contain as much as 13 per cent. of oil, but the proportion is rather variable. Its flesh-making elements are rather low. There are various other cakes that are used in feeding, but as most of them have only a passing interest attached to them, and are not largely used, I will only mention them by name: poppy cake, camelina, Sessame, hemp, cocoa-nut cake, &c. It is very often rather an undecided question with farmers Which is the cheapest and most profitable food to employ, corn or cake? and sometimes when the former is low in price, the latter is discarded altogether. Now, this is not right, for it should be remembered that linseed has medicinal as well as feeding qualities, and it is well known that animals are never so healthy, and never winter so well, as when they are supplied with linseed cake. It is by no means sufficient in estimating the relative value of corn and cake merely to ascertain the cost per ton. We will now take an analysis of beans, which is the next most concentrated form of food, and compare it with that of linseed cake, and we find that instead of having 12 per cent. of oil, it has only 2; 24 of albuminous compounds, 46 of starch, &c., and 3 of mineral matters. Now, since oil is estimated at more than double the value of the other carbonaceous matter such as starch, gum, and sugar, and again beans containing considerably less of the flesh-forming element than cake, it follows that the latter must be a very superior article to the former; and with beans we also include peas and lentils, being both very similar in composition to beans. We will next endeavour to ascertain the value of some of the articles used as food from an analysis of them, but of course nothing like certainty can be depended upon. Some may consider and assign a great value to one constituent, and some to another. From what I have already said with regard to the parts each constituent of food performs in the animal system, I should feel justified in valuing the oil at £20 per ton, albumen or flesh-forming element at £20 per ton, starchy matter, &c., £12 per ton, and the mineral matters at £5. Then, supposing linseed cake contained 12 per cent. of oil, 29 of albumen, 30 of starchy matters, and 6 per cent. of mineral, we should bring the value of 100 tons to £1,214—that is a trifle over £12 per ton, which is not far from the average cost. It is an easy way of estimating an analysis to take parts as representing so many tons, as I have done in the preceding instance. Now, if we were to value beans in the same way, we should bring them to nearly £11 per ton. Nine sacks of beans, at 24s. per sack, would amount to £10 16s. This, however, might be worked out in a different manner, as there are some beans heavier than others, and some of higher price. Oats, again, contain a larger proportion of fatty matter than beans, viz., as much as 5 per cent., but only a little more than half as much albuminous compounds, 57 per cent of starch, &c., and 3 per cent. mineral matters. By the same method we should value oats at £10 10s. per ton, Seven qrs. and a half, 37 lbs. to the bushel, at 28s. per qr., would just make that sum, which very much tended to support

the relative value given to the different constituents of food. Barley, valued in the same way, comes to about the same price as oats, taking the following per centages: Fat, 8; albuminous matters, 11; starch, 66; and materials, 8. Eleven sacks of barley, 51 lbs. to the bushel, at 38s. per qr., amounts to £10 9s. If we value the constituents of rape-cake in the same manner as we have those of linseed cake, we should bring the value about the same, whereas the former can be bought at a considerably lower price than the latter; but there is this fact that the animals do not like rape-cake, owing to its bitter taste, which I have before alluded to, and it is necessary to study the animal taste as well as the food. Then, again, the oil is of a thinner substance, and consequently is considered to be less fattening than linseed oil. If we, therefore, were to value the oil the same as the starch, viz., £12 per ton, instead of £20, we should bring the value of rape-cake to something like £10 per ton, showing that it is still cheap food if animals would eat it. The manuring of rape-cake, owing to its richness in nitrogenous matter, is comparatively high, being estimated at £4 0s. 9d. per ton. Decorticated cotton and earth-nut cake, being still richer in those compounds, are estimated even higher in manuring value, viz., £5 6s. 6d. and £4 18s. per ton respectively, whilst linseed cake is £3 15s. 8d. per ton. Some people think it is more profitable to buy linseed than the cake. This might have been some years ago, when the former could have been bought at a comparatively cheaper rate than now, but, although it contains three times the quantity of oil, it has less of the flesh-forming and starchy matters. Therefore the cake must be more profitable than the seed for feeding purposes. If we take the analysis of swedes we should find that the greater portion of them consists of water, viz., 89½ per cent. thus leaving a very small margin for the really necessary constituents of food, which consist of 1½ per cent. of nitrogenous matter, 8½ of starchy matter, and ½ per cent. of mineral substances. What a great difference in composition to linseed cake! It shows the superior advantage of giving cake in combination with turnips inasmuch as it supplies those ingredients of which the latter is deficient—that is mainly the flesh-forming principles. By feeding alone on turnips a much larger quantity of water is given than is desirable. It shows, likewise, that we were justified in placing a higher value on the flesh-making matters, because they are not found to a great extent in ordinary matters of food. If we value swedes in the same way as we have done the various other articles, we should bring them above their real value, and the manuring value about 4s. per ton. The composition of mangold is very similar to that of swedes. It, however, contains a larger amount of sugar, and is consequently, on the whole, considered of greater value than swedes. On account of the large amount of nitrogenous matter present in oilcakes the most profitable way of using it seems to be in combination with some article of an opposite character that is rich in respiratory matter, such as barley-meal, Indian-corn, or the carob or locust bean. Indian-corn is, however, now largely used alone for feeding purposes, the cost of this article being comparatively low, and its feeding qualities in proportion high. The locust bean, also known by the term St. John's bread, contains a large amount of sugar, which affords a means of not only augmenting the respiratory elements in mixtures of food, but, at the same time, imparts a sweet flavour, making coarse or other food more palatable to the animal fed. This property is rather a drawback than otherwise in one respect, inasmuch as the beans appear as nice to the boys on the farm as they do beneficial to the cattle. In fattening animals, a food in which the respiratory matter predominates would seem to be most suitable, since the muscles or flesh are incapable of increase to anything like the extent as fat. Respiratory matter, in the form of vegetable oil, is most favourable for the formation of fat: hence the efficiency of oilcake, although the common respiratory matter, such as starch, sugar, or mucilage, are also, though probably less easily, available for that purpose. We can scarcely give the animal too much nourishment, provided its health is maintained, as we thereby shorten the time of fattening, and thus save the food that would be otherwise consumed in sustaining the system during that period. But when the system is undergoing development, as in young or growing animals, we gain more the advantage of growth than the formation of fat, for which, of course, time to a certain extent is necessary, in which case the mineral

elements are particularly required, as well as a due proportion of respiratory and flesh-making elements. Deficient food, or what amounts to the same thing, food which does not furnish the requisite quantity of the various nutritive elements required by the animal to meet the wants of its system, is always a loss to the owners of stock, from the fact that the animals cease to make progress, and fall back, and thus it requires a much larger proportion of nutritive food to regain flesh than it otherwise would to have retained its former condition; and, again, all that food consumed, instead of yielding its proper return, was expended in keeping the animal alive. Moreover, all the time consumed, we might have been making progress. The quantity and quality of food required by animals will be just in proportion to this demand upon its system. An animal has no power to produce anything which Nature has ordained that it should unless the raw material of the same are supplied in food. It is by carrying out with care and judgment the principles involved in the feeding of animals that we can expect to dispose of the many kinds of food at our command to the best advantage, and thereby to develop the resources of agriculture, and increase, it is hoped, the profits of farming.

The lecture was illustrated by some interesting experiments with hydrogen, oxygen, &c., and samples of the various kinds of cake alluded to were produced, Mr. Spooner being received with applause on resuming his seat.

Mr. JOHN GATER opened the discussion. He said that Mr. Albert Spooner had made some remarks which came very opportunely at the present time, and he was pleased with the excellent lecture he had given them. These remarks came very appropriately at a time when stock rearing and fattening was gradually getting into disfavour with the agriculturist. Such a subject must be of interest to the agriculturist, especially at a time when, as now, the food for cattle was so short, and the practical farmer should know now that which would assist him in rearing and fattening the animals. It was also of importance to the people of the country that more stock should be reared and fattened, and that it should be known what food would do that more successfully than another. He could not help thinking, too, that some notice should be taken of other things as well as the way in which the animals should be fattened—the age required to be looked to as much as possible, the kind of stock, and the peculiar constitution of the animal itself. He believed that in differently constituted animals there must be different treatment. He thought the quantity and quality of the food might be so much varied as to give better and greater results in a larger number of instances than was at present the case. With reference to Mr. Spooner's remarks that some food being different in its results to other with cattle he might say, from what little knowledge of chemistry he possessed, that he quite agreed with him that food for cattle must be given the same as other food, according to the senses—the nose, taste, or sight, and this could only be arrived at by chemical analysis. It might be said that they could fatten their cattle without it, but he contended they could not really understand the value of their food without it was submitted to such a test. Therefore he thought that the study of foods and the analysing of them was only just in its infancy. Before sitting down he must say a word or two in favour of chemistry, of which he had heard Mr. Spooner speak. What he knew he learnt of the late John Nisbet, who was a first-rate agricultural chemist. They might depend upon it the agriculturist who could combine with his practical knowledge of farming a little of chemistry would be able to compete more successfully with the farmer who had no knowledge of it whatever. It was only by a knowledge of chemistry that they could know what was the real value of that which they were giving their animals, and come to a just conclusion. All he could say to them was if they had any sons now who were to become farmers above all give them some knowledge of chemistry, for they might depend upon it the day was fast approaching when the man who had a knowledge of it would have a better chance of getting a living than the one who knew nothing about it.

Mr. BLUNDELL said: In alluding to the deleterious matter in cake Mr. Spooner spoke of bran as being simply harmless, but he believed Mr. Gater would say it was something more than simply harmless. However, he would leave Mr. Gater to answer for himself. Then Mr. Spooner had made another remark with regard to the oil of mustard seed being almost poi-

sonous, and thus it was shown that while some cake contained that which was fattening others had that which was the reverse. Therefore, in order to know what was the nutritive value of the cake the farmer should know what were its real ingredients. With regard to the two sorts of cake of which he had spoken they could only test their value by analysis. Some men might say they could not do that, but there was no difficulty when they had the Royal Agricultural Society to fall back upon, as members of it could have anything analysed. They should not trust anyone. He would take no person's word. They might hand them an account of the analysis, but they could find out the excellence or otherwise of that which was offered to them by the simple mode of testing, some of which had been done by the gentleman who had lectured on that occasion. Upon other occasions their worthy secretary had set before them, with a great deal of clearness and practicability, the various modes by which they might ascertain the genuineness of feeding commodities. He thought each of them should be able to test the cake, and see how such and such a man was serving them. By sending it to the Royal Agricultural Chemist they could ascertain what that with which they were supplied was really composed of. It was important that agriculturists, seeing that cake was so dear, should ask the question, "Which is the best for cattle, cake or corn?" If they took into consideration the relative fattening properties of corn and cake, the same as Mr. A. Spooner had introduced to their notice, they would find that while corn stood pre-eminent and unassailable in fattening animals that the residue left from corn was very different to that left from cake. In his (Mr. Blundell's) experience he could tell them what was the difference in the state of the land where £100 had been spent in feeding cattle with cake and £100 in giving them corn. He considered, whether the money might be laid out more advantageously in corn or in cake, yet the residue of cake on ploughed land on an after crop was superior to anything else that had come under his experience. One observation of Mr. Spooner's with regard to the value of swedes and mangolds he could not quite understand. Probably the secretary would give them some observations upon it. As far as his experience went he thought a mangold was of considerably more value for fattening purposes than a swede, and if he was about to fat a bullock he would sooner have 60lbs. of mangold than 75lbs. of swedes—that was to say, it was one-fifth superior as a root food, that was that he would give one-fifth less of mangold than he would have to do of swedes. The precise value of these two things by analysis had not been shown, and he hoped Mr. Spooner would himself give them some idea on that point. He was sure they were all indebted to Mr. Spooner for his lecture, and he personally thanked him for it.

Mr. JAMES WITHERS was not prepared to say much about chemistry or chemicals, but he quite agreed with Mr. Gater that it was most desirable that all farmers should have some knowledge of it. He could see the necessity for it every day. With regard to the value of cake he could say that there was a marked difference in the land where he had fed sheep on it and where they had none. He fed 200 with it and 300 without it, and, where the sheep which were fed on cake had been, the barley was one-third better. He could see distinctly every fold.

The CHAIRMAN: Did the sheep consume as many turnips?

Mr. WITHERS: They had turnips.

The CHAIRMAN: Do you think they consumed so many turnips as they would otherwise?

Mr. WITHERS replied that he did not think they did. Those which had the cake seemed careless about the roots.

Mr. BLUNDELL remarked that as the price of hay was enormous, and there was a great scarcity of it, he should like their secretary to tell them what was the value of hay as compared with the present price of oats, linseed-cake, or beans—how much dearer hay was than it ought to be.

Mr. LEANE could not understand how it was that Mr. Spooner placed the swedes so high per ton.

Mr. A. SPOONER replied that he had taken their comparative value with reference to concentrated foods.

Mr. LEANE was afraid it had been overdone—that too high a value had been placed on them.

Mr. A. SPOONER thought not much, if they compared one with the other.

The CHAIRMAN said he could not understand the argument

at first, but the fattening and manurial value of the swedes was brought together.

Mr. STUBBS said he had experience with sheep, and he had come to the conclusion that they could hardly live now.

Mr. J. GATER: Can't you give us some theory how it is the stock of sheep is decreasing?

The CHAIRMAN: I suppose it is because we do not keep enough stock. Did not Mr. Stubbs think the drought of 1868 had much to do with it?

Mr. STUBBS replied that the drought in 1868 had much to do with the decrease in the number of sheep in 1869. Thousands of sheep were killed which never ought to have been slaughtered; in fact, three sheep were killed instead of two—that was, they were in such poor condition that three had to be killed to make up for two fat ones.

Mr. JOHN WITHERS remarked that Mr. A. Spooner had told them that linseed was not so valuable as the cake. How was it that by pressing out the oil it became more valuable?

Mr. A. SPOONER: Because what it loses in oil it gains in other valuables.

Mr. W. C. SPOONER said one or two questions had been put to him, which he had much pleasure in answering. The most important was with regard to the value of swedes. It appeared to him to be what his son had estimated. He had taken the theoretical value as given by analysis, subject to all drawbacks. If they could extract all the water from swedes and reduce them to cake, then the positive value would be something like what he had given it, seeing that for every ten tons of nutritive matter nearly 100 per cent. had to be taken off for waste, cleaning, the carriage to the farm, &c., which reduced their value at least one-third, and what Mr. A. Spooner had stated would be the practical value of the swedes if they were not attended with those circumstances. He was not at all satisfied that if they were taken into the town they could not be compared with hay for feeding cows and other cattle. No doubt the price would then be £1 to £1 5s. per ton. They had been able by study to reduce the value very accurately. They considered the various constituents of swedes and mangolds, and placed their value at so much per ton, and the same was done with regard to linseed-cake. They would find that in yard dung, from its bulk, the ammonia and phosphate there was of less value than in Peruvian guano and other foreign manures. Mr. Blundell had asked a question with regard to hay, which stood by analysis at something like one-half of the value of many kinds of concentrated food, but in hay there was a considerable and continual waste. There were scarcely two blades of grass alike, and where the animal would eat one it often refused the other, and thus there was waste. Some was got together much better, and in a sweeter condition than other parts, and that which was too dry was converted into woody fibre. This was one of the drawbacks with regard to hay, and he thought the best possible way of using it was by cutting it into chaff. He considered there was a great waste with it, and it was not worth the price at which it was now selling—viz., £6 to £7 per ton. It was made of that value in consequence of its scarcity, and because people in the town would have it for their highly-fed horses. A statement had been shown to him with regard to some experiments tried a long time ago by Mr. McCullum, in which turnips were shown to be superior when grown with yard dung to those grown with guano. That was tried in Scotland, but there had been many experiments tried since; and although they were in favour of what Mr. McCullum had stated, yet they were nothing like he had made out. There were many experiments, although he could not lay his hand on them just now, which had put his statements on one side to a very great extent. In Scotland they found that the swede turnips were more productive than they were in England. There were not many people in England who would like to give their cattle 150lbs. of swedes per day, but the practice showed their nutritive nature in Scotland. Mangolds were never a large crop in Scotland, and they were not so nutritious. They found that mangold wurzel was more nutritious than swedes, but at the same time they should not be given too largely. Mangolds contained a very large quantity of salt, and they would find that the green leaves contained a much larger quantity than the roots, and that accounted for the leaves causing purging when given to cattle. He thought the great secret in all cattle-feeding was a variety of food. Great care was required to be taken; for if they gave too much of one food, a large quantity passed away with

out being acted upon. By mixing concentrated foods with other things a much greater advantage might be obtained. Greater results have been obtained by giving a mixture of beans and cake together. It had been shown that two different kinds of food given together caused an animal to do better because of the variety it contained. For instance, with too much cake the oil would be partly wasted, and it would pass away as unproductive matter. There was no doubt but that the practice of combining maize with other food was a very good one. The paper read had shown that linseed and rape cake were three times more flesh-making, and were more beneficial as a manure. These were calculations made from analyses by Dr. Voelcker and Mr. Lawes. Indian corn was put down at £1 5s. per ton as manuring value, linseed cake at £3 15s., and rape at £4. Decorticated cotton cake was put down at £5 6s., and decorticated earth-nut cake and others at about the same. Much depended upon the way in which the palate of the animal was suited. A gentleman, who was a successful exhibitor at Southampton and also at Smithfield, had just had some locust beans. He had also a quantity last year, and he did not know what he wanted them for unless they were given to the animals. No doubt one of his reasons was that they might have a variety of food, and so their palates would be tempted. He thought if people who relied upon the different sorts of condiments were to mix a few locust beans instead, they would find that their animals would eat their food better, and that much good would result from it. If any further explanation were wished he should be happy to give it.

Mr. LENE quite agreed with Mr. Spooner with regard to the feeding of cattle, but he was not aware there was so much salt in mangold. He had been giving each of his beasts 140lbs. of mangold, 7lbs. of linseed cake, 4½lbs. cotton cake, and 6½lbs. of bean, pea, and barley meal per day, but he never knew them so thirsty before. Since the mangold had been taken away they had begun to refuse the water, which they wanted so badly before, and thus the cause was explained.

The CHAIRMAN said: It was quite clear they must take the value of the feeding stuffs by the result of analysis. They must supply that food which would be most tempting for the animal to take up. They found themselves the more variety of food they had the better it was for them, and he believed oilcake and beans given together was very good food for cattle. The linseed gave fat, and the beans had good flesh making properties. He thought it very desirable not to tax the animal by confining it to one kind of food alone, but to judge, from what it was doing, what kind of food it required.

Mr. W. C. SPOONER remarked that it had been found by experience that 150lbs. of swedes would produce one pound of beef, and a greater quantity of mutton. That would help to show them their proportionate value.

Mr. A. SPOONER, in reply, said he had no claim to practical experience, but he thought the most advantageous way of feeding cattle and sheep was to combine a variety of food, so as to please the palate, and at the same time increase the value of the manure.

THE BUTLAND AGRICULTURAL SOCIETY.

MEETING AT OAKHAM.

The cattle exhibited were about equal to the last show in point of number. The Uppingham school medal for the best beast in five classes was carried off by Mr. T. Pulver, of Broughton, near Kettering, that also took the first prize offered for the best ox or steer, of any breed or weight, exceeding three years old, Earl Spencer winning second honours. These animals competed together at Wellingboro' with a similar result. Mr. Pulver also secured the ribbon for the best steer under two years and six months. His prize medal ox has previously won prizes amounting to £84. Mr. Searson was extremely successful, as he carried off honours respectively for the best beast shown in classes 6 to 13, for the best ox or steer under three years, for the best cow above three years, and for the best young bull, and was commended in class 5. The show of sheep generally was not numerous, but the display of fat sheep was good. The principal prize-takers were Colonel Lowther, M.P., the Marquis of Exeter, Lord Berners, and Mr. Harris, of Wootton. The number of horses exhibited was quite up to the average, and they were rather superior than inferior in quality.

PRIZE LIST.

JUDGES for Cattle, Sheep, and Pigs:

J. Clayden, Littlebury.
C. Howard, Biddenham.
W. Sandy, Holme Pierrepont.

CATTLE.

Ox or steer, of any breed or weight, exceeding three years and three months old (open to all England).—First prize, £15, T. Pulver, Broughton; second, £7, Earl Spencer, Althorp Park, Northampton. Highly commended, Colonel Reeve, Leadenham, Grantham. Commended, J. P. M'Pherson, Muirton of Kinloss, Forres; T. Ross, Hillhead, Forres.

Ox or steer, of any breed or weight, not exceeding three years and three months old (open to all England).—First prize, £10, R. Searson, Market Deeping; second, £5, W. Sisman, Kimbolton.

Cow, of any breed, age, or weight (open to all England).—Prize, £10, Col. Reeve.

Heifer, not exceeding four years old, of any breed or weight (open to all England).—Prize, £10, R. Wood, Clapton, Thrapston. Commended, T. Rose.

Steer, under two years and six months old, fed within the

district.—First prize, £10, T. Pulver; second, £5, Marquis of Exeter, Burghley Park. Commended, R. Searson.

Best beast in the show.—Prize, the Uppingham School medal and extra premium of £25, T. Pulver, for ox exhibited in class 1.

Cow, above three years old, in milk or in calf.—First prize, £10, R. Searson; second, £5, Marquis of Exeter. Commended, J. J. Sharp, Broughton, Kettering.

Heifer, above two and under three years old, bred within the district.—First prize, £7, R. Searson; second, £5, C. Chapman, Brook Farm, Exton.

Heifer, under two years old, bred within the district.—First prize, £7, C. Chapman; second, £4, C. Speed, Horn Mills, Exton. Commended, E. H. Cheney, Gaddesby Hall, Leicester.

Bull, above twelve and not exceeding twenty months old.—First prize, £10, R. Searson; second, £5, Marquis of Exeter. Commended, L. Hardy, Burley-on-the-hill.

Cow, in milk.—First prize, £5, R. Fardell, Cold Overton; second, £2, J. Edgson, Langham. Commended, R. Coverley, Cottesmore; T. Clarke.

Heifer, under three years old.—First prize, £4, J. Harris, Langham; second, £2, C. Hubbard, Langham. Highly commended, R. Fardell. Commended, R. Coverley; W. Hotchkin, Burley-on-the-hill.

Heifer calf, above six and under twelve months old.—First prize, £2, Mrs. Hammond, Egleton; second, £1, J. Harris. Highly commended, H. Hayes, Langham.

Breeding beast shown as extra stock.—First prize, silver medal value 10 guineas, J. J. Sharp; second, silver medal value 5 guineas, R. Searson. Highly commended, W. Fowler, Manton. Commended, W. Colwell, Thorpe-by-Water.

Best beast shown in classes 6 to 13.—Prize, an extra premium of £10, R. Searson.

Best fat beast, above two years and six months old, shown as extra stock.—Prize, £5, R. Wood, Clapton, Thrapston. Highly commended, Marquis of Exeter.

SHEEP.

Three fat wether Leicester sheep, one year old (open to all England).—First prize, a silver cup or £10, Lord Berners, Keythorpe Hall; second, £5, Colonel Lowther, M.P., Barleythorpe Hall. Commended, W. Shipman, Eaton Lodge.

Three long-woolled fat wether sheep of the Lincoln breed, one year old (open to all England).—First prize, £10, T. W. D. Harris, Wootton; second, £5, J. Byron, Kirkby Green, Seaford.

Four long-woolled breeding ewes, bred within the district.—First prize, £5, Colonel Lowther; second, £3, C. J. Bradshaw, Barley-on-the-Hill.

Four long-woolled theaves, one year old, bred and fed within the district.—First prize, £5, Marquis of Exeter; second, £3, W. Shipman. Highly commended, Colonel Lowther.

Four longwoolled wether lambs, bred and fed within the district (ram lambs excepted).—First prize, £4, Colonel Lowther; second, £2, W. Shipman.

Four long-woolled ewe lambs, bred and fed within the district.—First prize, £4, Colonel Lowther; second, £2, W. Shipman.

The best sheep shown as extra stock (open to all England).—Prize, a silver medal value 5 guineas, T. W. D. Harris. Highly commended, W. Shipman.

PIGS.

Fat pig under 18 months old (open to all England).—First prize, £5, R. E. Duckering and Son, Northorpe, Kirton Lindsey; second, £3, W. Hughes, Oakham. Commended, W. Carver and Sons, Ingarsby.

Fat pig under 10 months old, not to exceed 30 stone live weight (open to all England).—First prize, £5, R. Pawley, Manton; second, £3, Messrs. R. E. Duckering. Commended, T. Sator, Brooke.

Fat pig of any weight.—First prize, £2, G. Chester, Walham; second, £1, Mrs. E. Knight, Burton-on-the-Hill.

HORSES.

JUDGES (Hunters): J. Berridge, Careby. — Braithwaite, Stackley. — Cockayne, East Langton. H. Thurnall, Royston. (Cart horses) H. Wagstaffe, Chesterton.

Mare for agricultural purposes.—First prize, £5, T. W. Fowler, Hall Farm, Exton; second, £3, T. Woods, Wythley Warren.

Cart horse under seven years old.—First prize, £5, T. Woods; second, £3, J. Bailey, Hambleton.

Hunting mare or gelding above five years old (open to all England).—First prize, £20, G. H. Finch, Burley Hall; second, £10, J. Hind, Ryhall Grange.

Farmers or tradesmen, four-year-old hunting mare or gelding, bred within the district.—First prize, £20, T. Cross, jun., Melton Mowbray; second, £10, T. Stokes, Warmington.

Farmers or tradesmen, three-year-old hunting mare or gelding, bred within the district.—First prize, £10, J. Brewster, Denton Lodge, Grantham; second, £5, W. Franklin, Barford Lodge, Kettering. Highly commended, F. Bowman, Duddington.

Hunting mare or gelding shown in the three previous classes.—Prize, a gold medal value 10 guineas, T. Cross, jun.

Tenant farmers or tradesmen, mare for breeding hunters.—Prize, £5, J. J. Sharp, Broughton.

Tenant farmers or tradesmen, hackney mare or gelding under seven years old, not exceeding 15 hands 1 in.—First prize, £10, G. Cant, Harringworth; second, £5, T. Bryan, Seaton Lodge, Uppingham. Commended, R. L. Bradshaw, sen., Tinwell.

Ponies under seven years old, not exceeding 13 hands.—First prize, £3, J. Hornsby, Grantham; second, hunting whip, N. Walters, Oakham.

THE LEEDS SMITHFIELD CATTLE SHOW.

That Leeds, with its quarter of a million of people, and its many prosperous industries, should aspire to have a fat show fit to follow suit to Smithfield is not strange. Although a town of manufacturers, it does not depend on any single line of business. It makes nearly everything, not only for export to the populations of the east, but for sale to the farmers of England—clothes, machinery, and implements, everything, in fact, from a washing-tub to a steam plough. It affects, therefore, a large agricultural interest, has a corn and cattle market unsurpassed in extent of business, and a Corn Exchange to be proud of. Beyond this it is situate in the centre of the county, close to the feeding pastures of Craven on one side, and on the other to the great arable district of central Yorkshire. It is not difficult to imagine, therefore, that the Leeds Smithfield Club would be an institution of a permanent character. For fourteen years has it continued to progress, and has so extended its operations as to make it one of the leading provincial winter exhibitions. Following the show of the Smithfield Club, the Leeds exhibition is the last act in the agricultural drama that begins at Birmingham, and it is quite worthy of its position. As a Christmas spectacle of the best animal products of the kingdom it is not one whit less imposing and instructive than the meetings which have preceded it; and celebrated as Leeds is at all times for the quality of the meat provided in its shambles, it may be proud of the collection of the treasures of the farm which have been displayed in the hall of the Leeds Smithfield Club.

The entries for the present show are nearly double those of last year, and are, so far, a satisfactory test of the popularity of the exhibition amongst breeders, and a proof that the management continues to guide affairs in a judicious manner. Good, however, as is the arrangement by which all the cattle classes are kept together in the Central Hall, so as to be inspected by the visitor by following the order of the catalogue, without having to enter upon a side wing, it will on another occasion be desirable to meet the further increase of visitors to give still more space between the rows of animals, and by taking the poultry altogether away from the Cattle Hall.

The attendance of the public is, in fact, evidence of the

increasing popularity of the exhibition. About 10,000 persons visited the yard on each of the two first days, £214 18s. 4d. being taken on Tuesday, and £215 11s. 8d. on Wednesday for admissions. On Thursday the attendance was still larger. Owing to a series of contingencies and the sudden exercise of power by Veterinary Inspectors in London, the Smithfield animals were not allowed to leave the yard at the proper time, so that we have too large a proportion of vacant stalls, especially in the cattle classes. A "beggarly array of empty benches" will chill any performance, and three or four empty stalls following each other consecutively have had a marked effect in detracting from the character and appearance of two or three important classes of cattle. Unfortunately, too, amongst the absentees was Mr. Pulver's champion ox, whose second appearance at Leeds was announced by Mr. Pulver, to be his final one on any stage. The non-arrival of this ox is still more to be regretted, as his competitors at Islington were admittedly rivals scarcely worthy of his steel; while at Leeds he would have had to meet the York prize Shorthorns. There were here 33 missing animals out of an entry of 95 head of cattle.

Glancing at the animals in their consecutive order, we come first to Lord Zetland's two Shorthorn oxen, first and second here for the "any age" prize; and although defeated by the Scotch ox of Mr. Reid's for the Mayor's £20 prize as best animal in the yard, the prize Shorthorn took the Innkeeper's £10 cup as best Shorthorn ox, cow, or heifer. The York decision was in this class also reversed, the second animal at York being first here. A heavier beast than the York winner he is, but that he is a better we certainly deny. With an extra weight of 10 or 12 stones, he is not so large in girth as the other. This shows his irregular making. Indeed as a Shorthorn ox he is not equal to the York winner; and as scales are not used yet as judges, we take it that a Shorthorn ox exhibited in a Shorthorn class at a fat show must not only be merely the best *fat* ox, but the best fat ox and best Shorthorn at the same time. The winner of the York prize for the young ox belonging to Mr. Thompson has H. C. only here; but he has broken down on his legs, and was suffering when shown at York, as he is now. Mr. Drysdale's third ox is a heavy beef ox entitled to his place. Of Shorthorn cows, out of six entries

three were absent, the splendid cow winner at York belonging to Mr. W. Hill, and also Sir W. Trevelyan's, and Lord Feversham's. The first prize went to Mr. Meynell Ingram for a useful roan cow, with capital crops and loin, but very deficient between rib and hip.

The absentees in the Shorthorn heifer class reduced a large entry of eleven to that of four moderate animals, and the winner was a fair good animal, but not prime enough to get a place at York. The prize cross-bred ox is a very moderate Irish exhibited by Mr. Scholefield, Tadcaster. What mischance has put him before Mr. Ross's second prize—a large and good specimen of the polled breed—we know not. Mr. Ross, however, is in better luck among the females, and takes first prize for cows, and cup for best cross-bred with a moderate animal. In Scotch oxen, we have only three, and Mr. Reid scores first and second; and with the same 3 years and 6 months wins first in his class, the Royal Agricultural Cup, value 6 guineas, as best Scotch ox or cow, and the Mayor's Cup, value £20, as best beast in the yard.

Scotch cows were moderate in quality and few in number; and Highland oxen the same. Sir C. Trevelyan's flat-sided mouse-coloured ox had only one to meet—a rough Highlander, "uncouth and unkempt," belonging to Mr. Drysdale, Fifeshire. The Highland cow of Mr. Eastwood, as at York, was first; Sir W. Trevelyan second, *sed longo intervallo*. The Scots made up a larger class than usual. In the Tenant Farmers' classes, Mr. R. Brogden and Mr. MacPherson were first and second, both York prize animals, Mr. Brogden being second in the young Shorthorn oxen, and Mr. MacPherson second in polled oxen. Mr. Brogden's ox has rare quality and fine making, but rather lacks growth. If he had more size nothing could beat him. Mr. Brogden's young 2 years 9 months Shorthorn took third here as at York. He is of superb quality, and would go on well. He displaces a magnificent beef ox of great weight, shown by Mr. Drysdale, for third place. The latter is rather coarse in bone and common in his hind legs while his young conqueror is at least a gentleman to look at, if not quite a ripe butcher's beast.

In cows Mr. W. Hill wins, as at York, with his fine Shorthorn, and Mr. Thomlinson, third at York, is second here worthily. Mr. Reid wins for heifers, and also takes *the Cup* for these classes, with his beautiful black 4 years, the beauty that we remarked upon at York when she, as here, stood first. The milch cows were a pretty numerous class, and Mr. Parsons won the first and the Cup with a cow well up in condition and full of Shorthorn blood, as well as of milking attributes.

The sheep were nearly the same as at York; Mr. Jordan, Mr. W. Hill, and Lord Wenlock taking all the honour and profit.

Pigs we shall not particularize. At a fat show in Yorkshire especially they are never deficient; and the names of exhibitors here show us how many of the animals that we have known in agricultural competitions are now closing their gay career, and approaching that bourne from which no prize pig ever returns alive—the butchers' shambles at Christmas time.

Poultry, pigeons, and rabbits ran up excellent and large classes.

PRIZE LIST.

JUDGES.

CATTLE AND SHEEP.—H. Ambler, Watkinson Hall, Halifax; C. Edmondson, Ripon; W. Silversides, York.

PIGS.—T. Dodds, Wakefield; G. Hutchinson, Prospect House, York.

ROOTS.—J. Parker, Dunkeswick, Harewood; R. Crossley, Newsam Green, Temple Newsam.

VETERINARY INSPECTOR.—Mr. Mitchell, M.R.C.V.S.L., Leeds.

SHORTHORNS.

Ox of any age.—First and second prizes and plate, the Earl of Zetland, Aske, Richmond; third, W. Drysdale, Kilrie, Kinghorn. Highly commended: H. S. Thompson, Kirkby Hall, York.

Cow, having had a living calf.—First prize, H. F. Meynell Ingram, M.P., Temple Newsam; second, John Ingleby, Austwick, Clapham; third, Jas. Reid, Greystone, Alford.

Heifer, not exceeding four years old.—First prize, Geo. Robson, Easingwold; second, Geo. Hargreaves, Shipley; third, John Ferguson, East Grange, Forres.

OTHER BREEDS.

Cross-bred or Irish ox.—First prize, W. Schofield, Tadcaster; second, Thos. Ross, Hillhead, Forres; third, Jas. Reid.

Cross-bred or Irish cow or heifer.—First prize and plate,

Thos. Ross; second, Jas. Bruce, Burnside, Fochabers; third, the Earl of Crawford and Balcarres, Haigh Hall, Wigan.

Polled Scotch ox.—First and second prizes and the Mayor's cup for the best animal in the show ground, Jas. Reid.

Polled Scotch cow or heifer.—Cattley, Wiganthorpe, York; second, Jas. Reid, Greystone, Alford. Highly commended: Wm. Drysdale, Kilrie, Fifeshire.

Highland ox.—First prize, Sir W. C. Trevelyan, Wallington; second, W. Drysdale.

Highland cow or heifer.—First prize, R. Eastwood, Thornholme, Clitheroe; second, Sir W. C. Trevelyan.

TENANT FARMERS' CLASSES, NOT BEING LANDOWNERS.

Ox.—First prize, R. Brogden, jun., Tockwith; second, J. P. McPherson, Muirton, of Kinloss, Forres; third, R. Brogden, jun. Highly-commended: W. Drysdale.

Cow, having had a living calf.—First prize, W. Hill, Wetherby; second, M. Thomlinson, Cowthorpe, Wetherby; third, J. W. Botherby, Middleton-one-Row.

Heifer under four years old.—First prize and cup, J. Reid, Greystone; second, T. Ross, Hillhead, Forres; third, J. Walton, Horncliffe Quarries, Rawtenstall.

Fat cow, in milk, for slaughtering.—First prize, a cup, R. Parsons, Leeds; second, J. Thackray, Leeds, third, J. Botterill, Leeds.

SHEEP.

LEICESTER OR LONG WOOL.

Pen of three wethers or gimmers, under 2 years old.—First and second prizes, F. Jordan's Exors., Eastburn, Driffield.

OTHER BREEDS.

Pen of three South or other Down wethers, of any age.—First and second prizes, the Right Hon. Lord Wenlock, Escrick Park.

Pen of three cross-bred wethers, of any age.—First prize and cup, J. Bruce, Fochabers; second, J. Hunter, Fochabers, North Britain.

Pen of three horned Scotch, Lonk, or Mountain wethers, of any age.—First prize, W. Hill, Wetherby; second, R. Eastwood, Clitheroe.

EXTRA.

Silver medal.—Lord Wenlock.

PIGS.

Fat pig, large breed, of any age.—First prize, R. E. Duckering and Son, Northorpe; second, W. Lister, Armley; third, R. E. Duckering and Son.

Fat pig, hog or gilt, middle breed, exceeding 14 months old.—First prize, R. E. Duckering and Son; second, R. Hurtle, Armley; third, C. F. Hallas, Huddersfield.

Fat pig, hog or gilt, middle breed, under 14 months old.—First prize, T. Greenwood, New Wortley; second, M. Walton, Halifax; third, C. Johnson, Potternewton.

Fat sow, middle breed.—First prize, W. Lister; second, R. E. Duckering and Son; third, — Ambler, Halifax.

Fat pig, hog or gilt, small breed, exceeding 14 months old.—First prize, R. E. Duckering and Son; second, M. Walton, Halifax; third, G. Mangles, Great Givendale.

Fat pig, hog or gilt, small breed, under 14 months old.—First prize, W. S. Moiser, Beeston; second, W. Wellock, Halton; third, — Ambler.

Fat sow, small breed.—First prize and cup, R. E. Duckering and Son; second, W. Hatton, Addingham; third, W. Lister, Armley.

Pen of three pork pigs, under 20 weeks old.—First prize, T. Turner, Leeds; second, J. King, Leeds; third, W. Hill, Wetherby.

EXTRA.

Silver medals awarded.—Sow, J. C. Taylor, Leeds; two gilts, S. Walton, Halifax; sow and litter, T. Hall, Leeds.

ROOTS.

Long mangold wurzel.—First prize, G. Nussey, jun., Sutterton, Spalding; second, W. H. Gaunt, Old Thorville, Kirkhammerton.

Globe mangel wurzel.—First prize, R. L. Everett, Rushmere, Ipswich; second, G. Nussey, jun.

Swedes turnips.—First prize, J. Johnson, Arthington; second, J. Bruce, Burnside, Fochabers, N.B.

Common turnips.—First prize, J. Bruce; second, W. Ripley, Kirkhammerton, York.

Potatoes.—E. Sucksmith, Hipperholme, Halifax; second, T. Wintersgill, Gownley Foot, Masham.

ABINGDON FAT CATTLE SHOW.

The Judges were :

BRATS AND CART COLTS.—W. Franklin, Ascot; B. Castle, Charlton; and G. M. Dunn, Ardington.

SHEEP AND PIGS.—J. Edmonds, Longworth Lodge, Faringdon; and G. Wallis, Old Shifford, Bampton.

ROOTS.—J. Litchfield, Southmoor; T. N. Dewe, Drayton; and R. Pyke, Lyford.

CORNS.—J. Weaving, Oxford; Mr. Prowse, Wallingford; and C. Cox, Abingdon.

PRIZE LIST.

BEASTS.

Best fat ox.—First prize, £5, H. Betteridge, Hanney; second, W. Aldworth, Frilford.

Best steer, under 3 years and 3 months old.—First prize, £5, H. Betteridge; second, W. Aldworth.

Best fat cow.—First prize, £5, J. P. King, near Wallingford; second, W. Aldworth.

Best fat heifer, under 4 years of age.—First prize, £5, Col. Loyd-Lindsay, M.P.; second, W. Aldworth. Highly commended: H. Betteridge.

Best two heifers in calf, under 3 years of age.—First prize, £3, W. Curtis, Fernham; second, W. Curtis.

Best beast shown in class 1 or 2.—A silver cup, H. Betteridge.

Best beast shown in class 3 or 4.—A silver cup, Col. Loyd-Lindsay, M.P.

Best two heifers in class 5.—A silver cup, W. Curtis.

SHEEP.

Best pen of three fat half-bred or Oxford Down wether sheep, under 22 months old.—First prize, £3, Col. Loyd-Lindsay, M.P.; second, Jas. Mason, Eynsham Hall.

Best pen of three fat Hampshire or Southdown wether sheep, under 22 months old.—First prize, £3, Sir W. Throckmorton, Bart.; second, Col. Loyd-Lindsay, M.P.

Best pen of three fat ewes.—First prize, £3, R. Badcock; second, R. Badcock.

Best pen of sheep in any class.—A silver cup, Sir W. Throckmorton.

PIGS.

Best pen of three fat pigs of one litter, under nine months old.—First prize, £2, J. Wallis, Kingston Bagpuize; second, H. Betteridge.

Best pen of three fat pigs under 14 months old.—First prize, £2, E. Pullen, sen., Sutton Courtney; second, E. Pullen.

Best fat hog, above 14 months old, irrespective of weight, age, or breed.—First prize, £2, W. M. Tagg, Charney Wick. Highly commended: R. Aldworth, Hagbourne; H. Humfrey, Kingston, near Shrivenham; and Sir W. Throckmorton. Commended: J. H. Clarke, Maidenhead.

Best pig in the show, age to be taken into consideration.—A silver cup, W. M. Tagg.

HORSES.

Best four-year-old hunter.—Prize, £10 10s., W. M. Tagg.

Best cart colt under three years old.—Prize, £5 5s., Colonel Loyd-Lindsay, M.P.

ROOTS.

Best five acres of swedish turnips, 25 to be exhibited.—A silver cup and prize of £2, W. Graham, Pewit; second, T. Latham, Wittenham.

Best two acres of mangold wurzel, 25 to be exhibited.—First prize, £3, W. M. Tagg; second, E. Pullen, sen.

Best collection of roots, not less than 10 each, field culture, and not less than four sorts.—First prize, £2 2s., W. M. Tagg; second, W. Graham.

Best collection of roots.—A silver cup, W. M. Tagg.

CORN.

Best five quarters of wheat, one bushel in an unmarked bag to be pitched.—First prize, £2, J. H. Clarke; second, R. Aldworth.

Best five quarters of barley, one bushel to be pitched.—First prize, £2, J. H. Clarke; second, R. Aldworth.

Mr. C. P. Duffield, of Marcham Park, presided at the dinner.

CHIPPENHAM AGRICULTURAL ASSOCIATION.

PRIZE LIST.

JUDGES OF STOCK.—Francis Burnett, Wilts.

Geo. Garne, Churchill.

John Treadwell, Winchendon.

CATTLE.

Bull, cow, and offspring.—£10, T. M. Ferris, Tytherton; second, £5, Isaac Cox, Whatley. Commended: J. Smith, Bynoll.

Fat steers above three years old.—£6, R. Stratton, Burderop; second, £4, T. H. Ferris, Manningford Bohun.

Fat steers under three years old.—£6, T. H. Ferris, Manningford; second, £4, W. F. Beaven, Woodborough.

Fat cows.—£6, J. Redman, Whaddon; second, £4, R. Chillingworth, Highworth.

Milch cows of any age.—£5, H. W. White, Stanley; second, £4, Oriel Viveash, Berwick Bassett. Commended: A. M. Sloper, Compton Bassett.

A prize of £5 was awarded also to J. Limbrick, Iron Acton.

Dairy cows under four years old.—£4, Mrs. E. Burbidge, South Wraxall; second, £2, J. Fry, Lacock.

Heifers under thirty-six months old.—£4, R. Stratton, Burderop; second, £2, S. Downing and Son, Chippenham. Commended: Mrs. E. Burbidge.

Heifers under twenty-four months old.—£5, T. Hewer, Inglesham; second, £3, the Marquis of Lansdowne, Bowood. Commended: Mrs. E. Burbidge.

Heifer calves under twelve months old.—£5, R. Stratton; second, £2, T. Hewer, Inglesham. Commended: W. F. Beaven, Woodborough; Isaac Cox, Whatley.

Bull calves under twelve months old.—£5, C. Hobbs, Maisey Hampton; second, £2, R. Stratton. Highly commended: H. Say, Lacock.

Bulls under two years old.—£5, R. Stratton. Highly commended: W. Spencer, Chalfield. Commended: G. Anstie, Hinton.

Bulls above two and under three years old.—£5, Chapman Uncles, Chippenham.

Working oxen.—£2, O. Viveash, Berwick Bassett.

SHEEP.

Four fat short-wool wethers.—£3, E. Little, Lanhill. Highly commended: H. Gough, Grittleton. Commended: E. Little.

Four fat long-wool wethers.—£4, T. Little, Nercott.

Four fat cross-bred wethers.—£4, J. Hibbard, Stanton.

Eight short-wool breeding ewes.—£5, R. Henly, jun., Calne; second, £3, J. Moore, Littlecot.

Eight long-wool breeding ewes.—£5, W. Limbrick, Horton.

Eight cross-bred breeding ewes.—£4, J. Whale, Corston; second, £2, J. Miles, Stanton.

HORSES.

Two-year-old cart gelding or filly.—£3, G. Anstie, Hinton.

Mares and foals.—£5, J. Farmer, Woodshan. Commended: W. Ghey, Littleton.

PIGS.

Boars.—£2, Mrs. E. Burbidge, South Wraxall; second, £1, J. Hibbard, Stanton.

Breeding sows.—£2, R. J. Butler, Bremhill; second, £1, J. Hibbard. Commended, Mrs. E. Burbidge; R. Spackman, Broughton; E. Little, Lanhill.

Two fat pigs of one litter.—£3, R. J. Butler.

Fat pigs of any age.—£2, Mrs. E. Burbidge.

CHEESE.

JUDGES.—C. Pitt.

J. Titley.

Best cwt. thick cheese.—£3, H. Reynolds, Dauntsey.

Second-best cwt. thick cheese.—£2, T. Newman, Cray's Marsh.

Best cwt. thin cheese.—£3, C. Beaven, Shipton Moyne.

Second-best cwt. of thin cheese.—£2, H. Reynolds.

THE TREDEGAR CATTLE SHOW AT NEWPORT.

At this annual exhibition there was a change in the arrangements. Formerly the stock was judged on the Monday, the principal day of the show being Tuesday, and the proceedings winding up with a dinner; whilst a second show-day was afforded on the Wednesday. This year Monday was devoted to receiving the stock in the show-yard, and on Tuesday the business commenced. The silver cups were eighteen in number, and the classes in which fewest exhibitors appeared were those of the North Devon Cattle. Not one local farmer entered for the cup given for the best yearling bull, best two-year-old heifer, or the best four-year old heifer. For most of the other cup prizes the entries were numerous, and the neighbouring tenantry sent in stock for competition. The Glamorganshire sheep were in some force; and the pigs numerous.

From what we hear the arrangements appear to have been simply lamentable, and the judging indifferent. A visitor assures us that though the authorities had the whole day before them not the slightest information was afforded as to the winning animals until eight o'clock at night, when of course every one had left, and the public who paid its money to witness the judging was refused the information to which it was entitled. Of course under such circumstances people said the awards were touched-up afterwards; while, according to *The Hereford Times*, "rumours were flying about that the judges had made such and such decisions, and there were not wanting instances in which, the reports being believed, those gentlemen were described as a 'set of fools,' either wholly incompetent to the discharge of their onerous duties or influenced by strong prejudices." As to the judging, so far as it could be followed, some of the best animals looked to be carefully left out, and Mr. Evans, of Swanstone, was sadly ill-used. They never noticed Lady Oxford, not even with so much as a commendation, though the best of her class at the Oxford Royal meeting; nor the young bull Sir Oliver, another prize animal in good company. The whole business appears to have degenerated into a wretched muddle, and yet this meeting has all the elements of a successful show under more efficient management.

JUDGES for Cattle, Sheep, Pigs, Cart-horses, and Implements: Thomas Swingle, Langham, Oakham, Rutland; John Wigmore, Lower Weston, Ross, Herefordshire; and Rees Williams, Pencelly Castle, Breconshire. **For Riding-horses:** D. R. Williamson, The Layers, Perthshire, and H. Arkwright, Hampton Court, Leominster.

PRIZE LIST.

SILVER CUPS GIVEN BY LORD TREDEGAR.

North Devon yearling bull.—Thos. H. Riden, Washford, Taunton, Somerset.

North Devon two-year-old heifer.—Rev. A. Morgan, Machen Rectory, Newport.

Shorthorn yearling bull.—Richard Stratton, Burderop, Swindon. Commended: Rev. E. T. Williams, Caldicot, Chepstow.

Shorthorn two-year-old heifer.—Lord Tredegar, Tredegar Park, Newport. Highly commended: Richard Stratton, Burderop, Swindon.

Hereford yearling bull.—Warren Evans Llandowlas, Usk Mon. Commended: William Harris, Llansoar, Caerleon, Mon.

Hereford, two-year-old heifer.—Rees Keene, Pencraig, Caerleon, Mon.

Boar.—C. R. Wheeler, Long Compton, Shipton-on-Stour. Highly commended: A. Higgins, Hewelsfield Court, Chepstow.

Fat pig.—C. R. Wheeler. Highly commended: H. Workman, Coedkernew, Newport.

Ram lamb, long wool.—R. Leyshon, Island Farm, Bridgend, Glamorgan. Highly commended: C. Spencer, Gilestown, Cowbridge, Glamorgan.

Ram lamb, short wool.—G. Wallis, Old Shifford, Bampton, Farringdon.

Yearling cart colt or filly, bred by the exhibitor.—R. W. Bridgwater, Great Porthamel, Talgarth, Brecon. Commended: T. B. Price, Duffryn St. Nicholas, Cardiff.

Shorthorn bull calf.—A cup, value £5 5s., T. Morris, Macmore Court, Gloucester.

Shorthorn heifer calf.—A cup, value £5 5s.; R. Stratton, Burderop, Swindon.

Hereford bull calf.—A cup, value £5 5s., W. Evans, Llandowlas, Usk, Monmouth.

Hereford heifer calf.—A cup, value £5 5s., J. H. Arkwright, Hampton Court, Leominster.

Yearling heifer.—A cup, value £5 5s., T. Hewer, Ingleham, Lechlade, Gloucestershire.

Stock bull, above two years old.—J. H. Arkwright, Hampton Court, Leominster.

Cows of any pure breed, in-calf or in-milk.—J. H. Arkwright.

North Devon Four-year-old heifer.—T. H. Riden, Washford, Taunton, Somerset.

Fat cow.—S. Channing, Pillgwenlly, Newport.

Pair of yearling steers.—Lord Tredegar.

Pair of two-year-old steers.—Wm. Williams, Red House, Ely, Cardiff.

Best male horned breeding animal selected from any class in the yard.—A piece of plate, value £21, W. Evans, Llandowlas, Usk, Monmouthshire.

Best female horned breeding animal selected from any class in the yard.—A piece of plate, value £21, Lord Tredegar.

SHEEP.

Four shearling ewes, long wool.—Prize, £5, J. Williams, Caercady, Cowbridge, Glamorgan.

Four shearling ewes, short wool.—Prize, £5, G. Wallis, Old Shifford, Bampton, Farringdon.

Pen of four breeding ewes and one ram, of real Welsh mountain breed.—Prize, £6 6s., J. Stephens, Hay, Brecon.

PIGS.

Boar and sow of any breed, under one year old.—J. Seys, The Graig, Newport.

Breeding sow, with litter of pigs not exceeding three months old.—Prize, £5, Joseph Waters, Langstone Court, Newport.

HORSES.

Cart mare and foal.—W. Hall, Tynwydd, Brecon.

Cart stallion that has covered in the county of Monmouth, in 1870.—W. Duke, Cefn Farm, Llanarth, Mon.

Nag mare for general purposes, in foal, to, or with colt by her side, by a thorough-bred horse.—W. Powell, M.P., per Mr. T. Stroud, Blackwood, Monmouthshire.

Pony, under four years old.—J. Thomas, Arcade Wine Vaults, Cardiff.

Cob or galloway bred in the county of Monmouth, Glamorgan, or Brecon, under six years old, over 13 hands and under 14 hands 2 inches high.—Prize, £5 5s., M. Williams, Caerleon, Monmouthshire.

Yearling colt or filly for hunting purposes, got by a thorough-bred horse, and bred in the county of Monmouth, Glamorgan, or Brecon.—W. Powell, M.P., per Mr. T. Stroud, Blackwood, Monmouthshire.

Three-year-old colt or filly for hunting purposes, got by a thorough-bred horse, and bred in the county of Monmouth, Glamorgan, or Brecon.—W. Williams, Red Farm, Penlyne, Cowbridge, Glamorgan.

Weight-carrying hunters.—Colonel F. C. Morgan, Rapera Castle, Newport; second, Captain M. Batt, Old Court, Abertgavenny.

Light-weight hunters.—G. C. Williams, Llanrumney Hall, Cardiff; second, G. W. G. Thomas, Coedriglan, Cardiff.

Thorough-bred entire colt, two years old or upwards.—Prize, £10 10s., T. C. Hallen, Brooks Farm, Raglan.

Best and most useful implements in agriculture.—Prize,

£5, J. S. Stone, implement maker, Dock-street, Trosnant, Newport.

Best general root crop, consisting of mangold wurtzel, Swedish or common turnip, in all not less than 15 acres growing on the farm of a tenant-farmer in Monmouthshire.—Prize, £10 10s., H. S. Williams, Soutbrook, Portskewett.

Best three acres of mangold wurtzel, grown by a tenant-farmer, whose farm is situated the south side of the road leading from Newport to Chepstow.—Prize, £5 5s., V. Parsons, Caerwent.

Five acres of swedes grown within the county of Monmouth.—Prize, £5, G. Jones, Undy, Magor.

NEWPORT TOWN PRIZES

Bull, cow, and offspring; the offspring being under one year old, the cow being in milk or within three months of calving, and she and her offspring having been bred by the exhibitor.—Prize, £10, W. Evans, Llandowlas, Usk, Mon.

Pair of breeding cows, in milk, or within three months of calving.—Prize, £10, W. Evans.

Pair of two-year-old steers, bred and fed by the exhibitor.—Prize, £10, W. Harria, Llansoar, Gaerleon, Mon.

Pair of yearling steers, bred and fed by the exhibitor.—Prize, £8, J. Skinner, Abernant Farm, Caerleon, Mon.

In-calf heifer under three years old, in milk, or within three months of calving.—First prize, £7, H. Hale, Trosnant, Newport; second, £3, H. Hale.

Yearling stock heifer.—Prize, £6, W. Jones, Cefnlogell, Castleton, Cardiff.

Pen of five wether lambs, long wool, bred and fed by the exhibitor.—Prize, £5, J. Williams, Caercady, Cowbridge.

Pen of five ewe lambs, long wool, bred and fed by the exhibitor.—Prize, £5, C. Spencer, Gileston, Cowbridge.

Pen of five yearling stock ewes, long wool, bred and fed by the exhibitor.—Prize, £5, J. Williams.

Pen of five breeding ewes, long wool, bred and fed by the exhibitor.—Prize, £5, J. Williams.

Piece (not less than ten acres) of Swedish turnips, growing within the county of Monmouth.—Prize, £10, W. Watkins, Wern-y-Cwm, Abergavenny.

Piece (not less than five acres) of Swedish turnips, grown by a tenant-farmer in the county of Monmouth.—Prize, £5, H. Price, Tithe House, Undy Magor.

Piece (not less than two acres) of mangold wurtzel, grown by a tenant-farmer in the county of Monmouth.—Prize, £5, H. Lawrence, Ty-Isha, Llantarnam, Newport.

THE SANDWICH CATTLE SHOW.

Unfortunately we had an extremely wet morning, which must have prevented many of our country friends attending. The show of cattle was very good, more especially the Sussex, of which 13 were exhibited. The two years old Sussex steer exhibited by Mr. H. Page, of Walmer, took the Town Cup, being the best steer, and the three years old Sussex heifer exhibited by Bradley Brothers, of St. Bartholomew's Farm, Sandwich, took the cup presented by Mr. H. Brassey, M.P. for Sandwich, as the best heifer in the show. It ought to be mentioned that the heifer winner of Mr. Brassey's prize was a most extraordinary fine specimen of the Sussex stock, in fact, several visitors who had seen the London show were of opinion nothing better was shown there. We had a good trade for the cattle; every animal was soon sold from 6s. 6d. to 7s. per 8lbs.

PRIZE LIST. CATTLE.

SUSSEX, HEREFORD, AND DEVON.

Steers, over three and under four years old.—First prize, £3, Bradley Brothers, St. Bartholomew; second, £2, Jno. Woodruff, Weddington.

Steers, over two and under three years old.—First prize, the Town Cup and £3, Henry Page, Walmer Court; second, £2, Bradley Brothers; third, £1, Bradley Brothers.

Heifers, over three and under four years old.—Silver cup and prize, £3, Bradley Brothers.

Heifers, over two and under three years old.—First prize, £3, Bradley Brothers; second, £2, Jno. Woodruff, Weddington.

WELSH AND SCOTCH.

Steers, over three and under four years old.—First prize, £3, G. R. Harnett, and £1 to breeder.

Steers, over two and under three years old.—First prize, £3, Mr. Harvey, and £1 to breeder.

Heifers, over three and under four years old.—Prize, £3, Jno. Woodruff.

Heifers, over two and under three years old.—No competition.

SHORTHORNS, OR ANY OTHER BREED.

Steers, over three and under four years old.—First prize, £3, E. Murton, Pedding, and £1 to breeder; second, £2, Lord Fitzwalter, Goodneston.

Steers, over two and under three years old.—First prize, £3, Henry Page, Walmer Court; second, £2, Bradley Brothers; third, £1 10s., T. Harvey; fourth, £1, C. Ratcliffe.

Heifers, over three and under four years old.—First prize, £3, W. Bushell, Rowling, and £1 to breeder; second, £2, Jno. Woodruff.

Heifers, over two and under three years old.—First prize, £3, Lord Fitzwalter; second, £2, Bradley Brothers.

THE GUILDFORD FAT STOCK SHOW.—The annual show of cattle, roots, corn and poultry in connexion with the Guildford Agricultural Association, was held on Monday and Tuesday. The stock show was small, owing to the fact that a number of the beasts which would have been exhibited had been shown in London. Nevertheless, the specimens exhibited were good. On Tuesday, the principal day, and market day, the weather was miserably wet, and consequently a great many persons who would have visited the show, stayed at home. Of the exhibitors of stock we may mention prominently Mr. H. Shotter, Mr. Beale who won the 10 guinea prize, Mr. Holland who exhibited a very superior heifer, and Mr. W. S. Smith who won several prizes. The cattle were Sussex and Shorthorns. The show of sheep was very small, and there was scarcely any competition. In pigs Mr. Wells was a most successful exhibitor. His stock, and those exhibited by Mr. Holland, were bought at prices averaging £10 each. The show of roots was unprecedentedly good, taking the dry season into consideration. The attendance at the market on Tuesday was large, but the amount of stock, except perhaps pigs, was small. Some good prices were made. Messrs. Hewett and Lee sold a dozen Devons at over 6s. per stone.

WEST OF ENGLAND FAT STOCK SHOW.—On Tuesday the annual show of the West of England commenced at Plymouth. Cattle are, of course, the prominent feature of the exhibition, and here the North Devons, as at Birmingham and Smithfield, take the lead, although the animals exhibited at the up-county shows are here excluded. The South Devon breed presented a very poor appearance when compared with the breed from the north of the county. Among them was one enormous beast, the first prize taker in Class 5, without any pretensions to shape, but standing just six feet high. The Shorthorns were the next breed, and, as at Smithfield and Birmingham, they produced the champion beast of the show. The animal now taking the champion plate was shown by Mr. Bult, of Taunton. The male Herefords were nothing very striking, though the first-prize ox would have, no doubt, been deserving of favourable comment if it had been taken more care of with a view to exhibition. The cows and heifers were an exceedingly good class. In the cross-bred classes there were some good useful animals. Of the six entries of extra stock only two appeared, but these were both fine beasts. Although the show of beasts is exceedingly good, surpassing both in numbers and quality anything of the sort that has been seen at Plymouth in preceding years. The sheep classes produce many fine pens. The pigs shown by Mr. Collier and Mr. Burt were very fine specimens of their respective breeds. The roots made a splendid exhibition; among the exhibitors and prize takers being Mr. W. Harvey, Ashpington, and Mrs. Grace Barter, Berry Pomeroy. The poultry exhibition was, generally, a first-class show of 470 pens.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: Wednesday, Dec. 7.—Present: Lord Vernon, President, in the chair; the Earl of Lichfield, the Earl of Powis, Viscount Bridport, Lord Tredegar, Lord Walsingham, Sir Massey Lopes, Bart., M.P., Sir A. K. Macdonald, Bart., Sir Watkin W. Wynn, Bart., M.P., Mr. Baldwin, Mr. Barthropp, Mr. Booth, Mr. Bowly, Mr. Cantrell, Colonel Challoner, Mr. Clive, Mr. Davies, Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Holland, Mr. Hornsby, Mr. Wren Hoskyns, M.P., Mr. Lawes, Mr. Leeds, Mr. Milward, Mr. Pain, Mr. Randell, Mr. Rigden, Mr. Sanday, Mr. Shuttleworth, Mr. Thompson, Mr. Torr, Mr. Webb, Mr. Wells, M.P., Mr. Whitehead, Mr. Jacob Wilson, and Dr. Voelcker.

The following new members were elected:

Armstrong, J. W., Fairlie, Greenock.
 Baker, Thomas, Blackstone, Bewdley.
 Broadbent, J. H., Sealand, Chester.
 Burney, Thomas, Eastleigh, Hants.
 Corden, Arthur H., Brineton, Shifnal.
 Corden, John, Great Chatwell, Newport, Salop.
 Crosthwaite, Peter, Monk's Hall, Keswick.
 Gilbey, Alfred, Wooburn House, Beaconsfield.
 Hall, W. Henry, Glen Parva, Leicester.
 Harding, William, Marksby Vale, Bristol.
 Harrison, T. Ashton, Stalybridge, Cheshire.
 Key, Major-General G. W., Manor House, Coates, Cirencester.
 Mawer, Edward, Thorney, Peterborough.
 Newport, Henry A. Wakeman, Cotton Hall, Bridgnorth.
 Nicholl, G. Whitlock, The Ham, Cowbridge.
 Nuttall, James, Chaddeaden, Derby.
 Orlebar, H. Amherst, The Rocks, East Grinstead.
 Playfair, George G., Erroll Villa, Southbrook-road, Lee, Kent.
 Rayner, Captain W. S. M., Lounde House, Benlob Hill, Upper Norwood.
 Round, D. George, Portland House, Edgbaston, Birmingham.
 Sankey, Thomas, Burntwood, Lichfield.
 Thompson, E. J., Timperley, Altrincham.
 Wilding, Joseph, Bank House, Tyldesley.
 Williams, John, Gwernhefn, Bala.

FINANCES.—Major-General Viscount Bridport (chairman) presented the report, from which it appeared that the secretary's receipts during the past month had been duly examined by the Committee and by Messrs. Quilter, Ball, and Co., the Society's accountants, and found correct. The balance in the hands of the bankers on Nov. 30 was £1,535 14s. 9d. The Committee recommended that Mr. H. J. Hine's salary be increased to £100 per annum. The Committee had met ten times and made nine reports.—This report was adopted.

JOURNAL.—Mr. Thompson (chairman) reported that a letter had been received from Captain Dashwood, in reference to the farm-prize competitions; it was recommended that Captain Dashwood be thanked for his communication, which raised some important questions, and informed that the Committee would take them into careful consideration in the event of future competitions being sanctioned by the Council. It was also reported that the Committee had met ten times during the year and made nine reports, and that they recommended the addition of the name of Mr. Charles Whitehead to the list of the Committee.—The report was adopted.

CHEMICAL.—Mr. Wells, M.P., presented the following report:—

Dr. Voelcker reports the following case of a manure sent to him for analysis, by Mr. C. S. Read, M.P., under

the name of Holman's Blood Manure. This manure was found to have the following composition:—

Moisture	30.93
*Organic matter	22.02
Tribasic phosphate of lime (bone phosphate)	5.06
Oxides of iron and alumina	5.10
Sulphate and little carbonate of lime	18.11
Alkaline salts and magnesia (chiefly common salt)	6.06
Insoluble siliceous matter	12.73
						<hr/> 100.00
*Containing nitrogen	1.91
Equal to ammonia	2.33

This manure was manufactured by N. R. Holman, manufacturer and dealer in agricultural tillages, Newhall Mills, Attercliffe, and Sheffield. The price of this manure is £6 a ton, delivered carriage paid to any station within 50 miles of Sheffield.

In a trade circular, Mr. Holman speaks of his blood-manure as having acquired a world-famous reputation as one of the best and cheapest tillages, and invites his friends and all consumers to an inspection of the numerous testimonials with which he has been favoured. He likewise gives an analysis, of which the following is a copy:

ANALYSIS OF BLOOD MANURE.

Medical Institution, Sheffield.

A sample of artificial manure, received from Mr. Holman, was found, on analysis, to contain in 100 parts:

Moisture and organic matters, containing 17.72 of ammonia, equivalent to 14.58 of nitrogen	64.40
Insoluble silicate and sulphate of lime	11.00
Phosphate of lime, equivalent to 4.34 of phosphoric acid	9.40
Oxides of iron and alumina	2.35
Carbonate of lime	5.10
Ditto magnesia	1.80
Alkaline salts (chlorides and sulphates)	4.45
Ditto (soluble silicates)	1.60
	<hr/> 100.00

March 1, 1865.

(Signed) W. BINGLEY, Ph.D., F.C.S.

In this analysis the manure is represented to contain more ammonia than the best samples of Peruvian guano. Supposing the sample analysed by Dr. Bingley contained only 10 per cent. of moisture, and not 32, like the sample sent to me by Mr. Read, I am at a loss to understand how the remaining 54.4 of organic matter could have yielded 17.72 of ammonia.

That amount of the richest available nitrogenous organic matter, or even of pure sulphate of ammonia, produces considerably less ammonia than 17.72 per cent. However, presuming the analysis to be correct, the question which would naturally be asked by any intelligent farmer who knows something of the market price of fertilising materials, is: Is it probable that a manure manufacturer will sell an artificial manure at £6, when he can get for the ammonia alone, which is represented to be present in a ton of the manure, over £10?

Attention is directed to this analysis, because in many instances farmers are led astray by printed analyses, which many regard as a sufficient guarantee of the good quality of the manure to which they refer. Whenever an analysis is shown, when an artificial manure is offered for sale, and such an analysis should prove to be satisfactory, we would advise the intending purchaser to obtain in the first

place a statement in writing that the bulk of the manure on delivery shall be equal in composition with that given in the printed analysis; and in the next place he should draw from various parts of the bulk several pounds of the manure, mix all the samples well together, and forward such a fairly drawn and prepared average to a competent and trustworthy agricultural chemist for analysis. Neither printed analyses nor printed testimonials in themselves have practical value, and both are often used for the purpose of deception.

The sample of Holman's Blood Manure, analysed by me, it will be seen, instead of 17.72 per cent. of ammonia, as represented in the printed analysis, yielded only 2½ per cent.; and instead of 9.4 per cent. of phosphate of lime, only 5 per cent.; and, besides a large proportion of sand and useless earthy matter, it contained 81 per cent. of water in round numbers. Such a manure would be dear at £2 5s., and I would not recommend any one to buy it at £2 a ton.

Mr. C. S. Read has kindly favoured me with the subjoined letter, and given me leave to lay it before the Chemical Committee:

Holman's Manure.

Honingham Thorpe, Norwich, Nov. 16, 1870.

My dear Sir,—On receipt of your analysis of Mr. Holman's manure, I wrote to him, stating "that I certainly should not pay for the manure." At Mr. Holman's earnest request I did not send the manure back, but agreed to his proposition to "pay whatever it was worth, according to the crop it produced." I thought that it would be a good opportunity of testing the soundness of your analysis, and accordingly sowed 4 cwt. per acre of this manure, and two different kinds of superphosphates, both costing the same price as Mr. Holman charged for his manure, viz., £6 per ton. They were applied for white Turnips after Peas, and a strip of land was left, upon which no manure of any kind was sown. The two superphosphates have grown a nice little crop of Turnips, but I can see no difference at all between the unmanured plot and Mr. Holman's blood manure. I ought to add, that Mr. Holman states, the "second crop is equally benefited as the first." I hope, for his sake and mine, it will be *more so*.

Yours faithfully,

Dr. Voelcker.

CLARE SEWELL READ.

The committee would call attention to the frequent inferiority of certain manures sold under the name of fish-and-blood manures. A sample of such a fish-and-blood manure (sent by Mr. N. N. Young, Orlingbury, Wellingboro') had the following composition:

Moisture	18.86
*Organic matter	25.63
Oxides of iron and alumina	4.43
Phosphate of lime	1.92
Sulphate and carbonate of lime...	32.72
Alkaline salts and magnesia (chiefly common salt)	3.69
Insoluble siliceous matter (sand)	12.75
					100.00

*Containing nitrogen	1.20
Equal to ammonia	1.45

This so-called fish-and-blood manure is very poor in phosphate of lime; and as dry blood and flesh yield about 16 per cent. of ammonia on decomposition, the sample analysed, producing not quite 1½ per cent. of ammonia, cannot have contained much blood or fish. It is principally composed of carbonate of lime, earth, and sand, mixed with various kinds of organic refuse matters, a little blood, some fishery salt, and a few fish-bones. Such a manure is barely worth 25s. a ton, but was sold at £6 a ton.

With respect to feeding cakes, Dr. Voelcker reports the case of a linseed cake, which was sold to Mr. Jas.

J. Bibby, Hardwicke Grange, Shrewsbury, branded, "W H Genuine." This cake he found to be adulterated with earth-nut cake, and to be of the following composition:

Moisture	9.20
Oil	9.90
*Albuminous compounds (flesh-forming matters)	26.18
Mucilage, sugar, and digestible fibre	30.84
Woody fibre cellulose)	17.36
Mineral matter (ash)	6.52
					100.00

*Containing nitrogen ... 4.19

In answer to an inquiry for particulars of the purchase, Mr. Bibby writes that he bought a lot of 5 tons in July, from Messrs. Fields' Mercantile Company (Limited), Shrewsbury, as a genuine cake, at £11 7s. 6d. per ton, delivered. Messrs. Fields, the dealers, state that the maker is W. Holt, of Hull.

The following correspondence ensued:

Hardwicke Grange, Shrewsbury, Nov. 2, 1870.

Dr. Voelcker, London, E.C.

Dear Sir,—I duly received yours of the 18th and 21st ult., with analysis and report on a sample of adulterated linseed cake branded "W H Genuine," and, as requested, I write to inform you of the particulars of the purchase.

The sample is from a lot of 5 tons, bought in July from Fields' Mercantile Company (Limited), Shrewsbury, as a genuine cake, price £11 7s. 6d. per ton, delivered—"Earles and King's," Liverpool cake being then £12 7s. 6d. per ton, delivered. Messrs. Fields, who are dealers, inform me that the maker is W. Holt, Hull. I have written for an explanation, and annex a copy of my letter and of the maker's reply, &c.—I am, dear sir, yours faithfully,

JAS. J. BIBBY (pro Jos. Winchester).

(Copy.)

Grinshill, Shrewsbury, October 26, 1870.

Messrs. Fields' Mercantile Company, Shrewsbury.

Gentlemen,—In July last I bought from you a parcel of 5 tons linseed cake branded "W H Genuine," which was described by your manager, and sold, as a genuine linseed cake. I regret to say, however, that the analysis of a sample by Dr. Voelcker shows the cake to be adulterated, and, of course, inferior in quality to genuine linseed cake. I enclose an extract from Dr. Voelcker's letter, and a copy of his analysis; and waiting your reply.—I am, yours faithfully,

JOSEPH WINCHESTER.

(Copy.)

Shrewsbury, October 31, 1870.

From Fields' Mercantile Company.

To Mr. Jos. Winchester, Grinshill.

We beg to hand you a copy of the letter which we have received from the crushers at Hull, and we trust that it will be acceptable and satisfactory.

[Copy of enclosure with the above.]

Hull, October 28, 1870.

Messrs. Fields' Mercantile Company.

Dear Sirs,—In reply to your favour of yesterday, enclosing "copy of analysis," &c., of 5 tons linseed cakes marked "W. & H." "Genuine," and supplied to you in July last, we beg to state that the term "genuine," as a trade brand, is not understood to signify a pure cake, which, as you are aware, is always sold at 20s. to 25s. per ton more money, and at the time we sold you the 5 tons referred to we were selling pure cakes at 22s. 6d. more. The difference between "pure" and "genuine" cake, when these brands were first introduced, was simply that the former was made from the finest seed imported, and the latter from a secondary or inferior growth, containing a considerable percentage of non-feeding admixture, such as hay seeds, &c., and generally more or less of grit, which washers have found great difficulty in screening from the seed; in fact, it could not be entirely removed. For some time past, therefore, it has been the general custom of the trade to use fine clean seed also for "genuine" cakes, reducing the price by the admixture of a small proportion of other good feeding stuff, thus producing what we believe to be a better feeding

cake at the same cost. We may add that we have always supplied to our friends a cake of quality at least equal to any on our market at the same price; and the analysis you have sent us shows that cake sent you was of good feeding quality, and, we believe, for feeding purposes if anything a little cheaper in proportion than a "pure" cake at 20s. to 25s. per ton more money.

[Copy of reply to the foregoing.]

Grinshill, Shrewsbury, November 2, 1870.

Messrs. Fields' Mercantile Company, Shrewsbury.

Gentlemen,—I have to acknowledge receipt of yours of 31st ult., enclosing copy of a letter from the manufacturers of the cake, bought from you in July, in reply to the complaint of its being adulterated.

As the cake was not only sold as branded "Genuine," but as a "Genuine Cake," I do not consider the explanation at all satisfactory. No trade usage can justify an adulterated cake being sold as "genuine."

I was not aware, till your secretary informed me on Saturday last, that the makers quoted for "pure" cake a higher price than "genuine;" and I consider this fact being known to you ought to have led to inquiries before the sale as a pure cake of that branded "Genuine."—I am, gentlemen, yours faithfully,

JOSEPH WINCHESTER.

P.S.—I send a copy of the correspondence to Dr. Voelcker.

Two other cases, where cakes sold as pure were found on analysis to be adulterated—one with oat-dust, and the other with earth-nut cake and beech-nut cake, came under Dr. Voelcker's notice; but the committee think that the evidence in these instances, though sufficiently convincing, might not have the requisite legal force to warrant the publication of the names of the vendors.

In pursuance of the recommendation made by the committee in their last report, a suggestion was forwarded to Messrs. Thomson, Bonar, and Co., that some standard of quality for guano should be settled upon by the importers, and all cargoes valued accordingly. This communication has been transmitted by Messrs. Thomson, Bonar, and Co. to Senor Toribio Sanz, the agent of the Peruvian Government, and this gentleman has undertaken to submit the matter to the authorities in Peru.

With reference to the case of Mr. W. Bradburn, the committee have to report that they have received notice from that gentleman's solicitor that it is his intention to take legal proceedings against the Society; and the secretary having been requested to furnish the name of the Society's solicitor, it is recommended by the committee that the question of choosing a solicitor to represent the Society in this case be referred to the Finance Committee.

The committee have met six times, and issued reports in March and June.

They recommend that extracts, as usual, from Dr. Voelcker's quarterly report, be published in the agricultural journals.

They recommend the following to be the list of the members of the Chemical Committee:—Lord Vernon, William Wells, M.P., W. J. Edmonds, D. R. Davies, J. D. Dent, M.P., Sir Massey Lopes, E. Holland, C. Wren Hoskyns, M.P., Lord Lichfield, J. B. Lawes, Dr. A. Voelcker, Jacob Wilson, and C. Whitehead.

These reports were adopted.

STOCK PRIZES.—Mr. Milward (chairman) reported that the list of prizes to be offered by the Wolverhampton local committee had not been completed, and that they therefore recommended the publication of the Society's prize-list as sanctioned by the special Council summoned for the purpose, with an announcement that a complete prize-sheet giving the prizes offered by the local committee will be issued as soon as possible. The annual report of the committee was also presented. These reports were adopted. In accordance with the notice given

at the last monthly Council, it was then moved by Mr. Milward "that the resolution of June 1, respecting prizes for mules and asses be rescinded." This motion was seconded by Mr. Jacob Wilson, who stated that the Welsh agricultural societies, whose prize-sheets he had been able to obtain, did not offer prizes for these animals, although Wales was considered their great stronghold. The motion was supported by Mr. Randell, Mr. Booth, and Mr. Torr, who maintained that the small farmer should rather be encouraged to breed mountain ponies of good character in preference to donkeys. On the other hand, the Earl of Powis supported the June resolution, which had been proposed by himself, on the grounds then stated, and remarked further that it was as desirable for the Society to aid the small farmer by offering prizes for asses, as to aid the large farmer by offering prizes for steam-engines. He was supported by Lord Walsingham, who considered the breed of donkeys capable of great improvement; by Colonel Challoner, who urged the quality of endurance possessed by mules; and by Mr. Wren Hoskyns, on the ground that if such animals were extensively employed in agriculture, it was the duty of the Society to attempt to improve the breed. Ultimately, it having been acknowledged that, as mules are not breeding animals, it would be against the practice of the Society to offer prizes for them; the question was put with reference to donkeys. On a division, Mr. Milward's motion was carried by 20 votes against 7.

VETERINARY.—Major-General Viscount Bridport (chairman) reported that, up to the present time, they had received no report from Professor Simonds with regard to the experiments which they had requested him to make in pleuro-pneumonia. The committee had met four times during the year, and made four reports, and they recommended that the name of Mr. M. W. Ridley, M.P. be added to the list of the committee.—This report was adopted.

GENERAL WOLVERHAMPTON.—Mr. D. R. Davies reported that the ex-mayor, on behalf of the local committee of Wolverhampton, having explained that the siding from the goods station to the showyard, which the local committee had undertaken to make, would entail considerable expense on them; the committee recommended that the Wolverhampton local committee be relieved of their undertaking to make the aforesaid siding, on the condition that the expenses to exhibitors shall not be thereby increased, and that the local committee add prizes to the amount of £1,000 to the Society's prize sheet. The contract between the local committee and the Society not to be in any other respect affected by this agreement.—This report was adopted.

SHOWYARD CONTRACTS.—Mr. C. Randell reported that the members of the committee had each been supplied with a copy of the conditions and specifications for a new contract for the erection of showyard works, as ordered by the Council, and that these conditions having been finally considered by the committee, they recommended that they be now printed under the direction of the secretary, and that he be authorised to advertise for tenders. It was also reported that the surveyor had supplied the Wolverhampton local committee with a plan of the intended showyard, and had given instruction for the necessary draining, levelling, removal of fences, and forming approach-roads. The annual report stated that the committee had met nine times and made seven reports to the Council; that they had been perfectly satisfied with the showyard works as carried out by the present contractor under the superintendence of the surveyor; and that, as the existing contract will expire at the conclusion of the Wolverhampton meeting, they had made the necessary preparations for obtaining tenders for a new contract to commence at that time. These reports were adopted.

SELECTION.—On the motion of the chairman of this committee (Mr. Thompson) the list of the committee for the ensuing year was discussed and agreed to. The annual reports of the Implement, House, and Education Committees were also received and adopted.

The Earl of Lichfield moved, "That in selecting a town for the holding of the exhibition in 1872, the plan of the Bath and West of England Society be adopted." In support of this motion he urged the unnecessary expense that many towns are put to under the present system, and the feeling of annoyance caused by defeat, which he regarded as more important to the Society than the question of expense. The effect on the success of the meeting was also stated to be very marked, as many did not subscribe to the local fund of the successful town on the ground that they wanted the meeting held a tone of the other towns which had been put in competition. In anticipating objections that might be brought forward, he urged that the only advantage accruing to the Society by the competition was occasionally an increased subscription from the winning town, all other arrangements being made after the selection of the town. Mr. Holland, in seconding the motion, stated that the Bath and West of England Society found no difficulty in working their scheme, and that by it no jealousy was created, and no expense incurred. Mr. Rigden, although a member of the Council of the Bath and West of England Society, preferred the plan of competition, and considered that quite as much offence would be given to the towns not selected, as is now taken by those which compete unsuccessfully. Mr. Randell and Mr. Milward urged the greater requirements of the Royal Society, and the difficulty that would be raised if the first town selected were either incapable or unwilling to receive the Society. Mr. Wren Hoskyns and the President gave instances of the bad feeling which had been created, in the districts in which Herefordshire and Derbyshire are situated, by unsuccessful competition; and Mr. Torr rebutted the charge, which was made in some districts, of the conclusion of the Council in certain cases having been foregone. Mr. Thompson referred to the gradual expansion of the Society's exhibitions under the competition principle; but at the same time considered that now it might be advisable to discuss whether the annoyance caused in some instances might not be averted by a modification of our practice. He therefore suggested that the subject should be referred to a committee. Lord Lichfield having adopted this suggestion, it was resolved: "That a Committee be now appointed to consider and report to the Council whether it is in their opinion desirable to make any change in the present mode of inviting competition between the leading towns of the district selected for the Society's country meeting; the committee to consist of the Earl of Lichfield, Mr. Wells, M.P., Mr. Wren Hoskyns, M.P., Mr. Randell, Mr. Thompson, Mr. Torr, and Mr. Jacob Wilson. The secretary was then instructed to send the usual letters to Cardiff, Cheltenham, and Hereford. Mr. W. J. Edmonds withdrew the motion of which he had given notice, viz.:

"That the sum of £10 to be voted to the Cirencester Chamber of Agriculture, for the purpose of assisting its committee to carry out, in conjunction with the Professors of the Royal Agricultural College, manurial and other experiments upon corn and root crops."

A communication was received from the Royal Dublin Society, stating that in accordance with a newly enacted bye-law, the President of the Royal Agricultural Society was *ex officio* an honorary member of the Royal Dublin Society.

A letter having been read from Mr. C. E. Amos, the Society's consulting engineer, resigning his office, it was moved by Lord Bridport, seconded by Mr. Thompson, and carried unanimously, that

"The Council have received with much regret the resignation of Mr. Amos, the consulting engineer of the Society, and they cannot do so without recording their sense of the very valuable services rendered to the Society by Mr. Amos for so many years, and that it be referred to the Committee of Selection to consider and report to the Council in what mode their appreciation of the valuable services rendered by Mr. Amos can best be expressed and conveyed to him."

A letter was read from Mr. Hassall, resigning his seat at the Council.

The annual report of the Council to the general meeting was prepared.

The Half-yearly Meeting of this Society took place on Thursday, at noon, in Hanover Square; the President, Lord Vernon, in the chair. The attendance was, as usual at the December meeting, numerous, and rather above the average even for the Smithfield week.

The SECRETARY, Mr. H. M. Jenkins, read the Report of the Council, which was as follows:—

The Council of the Royal Agricultural Society of England in presenting their Half-yearly Report, have to state that since the last General Meeting in May, 3 Governors and 39 Members have died, and the names of 62 Members have been removed from the list; on the other hand, 3 Governors and 172 Members have been elected, so that the Society now consists of

74 Life Governors,
74 Annual Governors,
1547 Life Members,
3899 Annual Members,
15 Honorary Members,

making a total of 5609.

Conformably with the provisions of the Charter the Council have enacted the following Bye-law:—"Members who have paid their annual subscriptions for 20 years or upwards, and whose subscriptions are not in arrear, may compound for future annual subscriptions, that of the current year inclusive by a single payment of £5."

The half-yearly statement of accounts to the 30th June, 1870, has been examined and approved by the auditors and accountants of the Society, and has been published for the information of the members in the last number of the *Journal*. The funded capital of the Society remains the same as at the last half-yearly meeting, namely, the permanent fund of £20,000 New Three per Cents., and the Reserve Show-fund of £4,612 7s. 8d. New Three per Cents.; but the deficiency in the Show-yard receipts at the Oxford Meeting entailed a cost to the Society of more than two thousand pounds. On the 1st instant the actual balance of the current account at the London and Westminster Bank was £1,535 14s. 6d.

Notwithstanding this pecuniary loss, the Council have reason to congratulate the members of the Society on the result of their second meeting at Oxford. The entries of implements, cattle, sheep, and pigs were more numerous than at any previous meeting of the Society, while the quality of the animals exhibited in most classes reached the highest standard.

The most distinctive feature of the Oxford Meeting was the competition for the farm prizes offered by Mr. Mason and the Society for the two best managed farms in the Oxfordshire district. The awards of the judges were made known at the general meeting of members held in the showyard, and, on their recommendation, a third prize was added by the Society. The report of the competition, with descriptions of the prize and commended farms, written by Mr. H. W. Keary, one of the judges, has been published in the last number of the *Journal*. The farming of every district has its strong and its weak points, and each season its peculiarities. To point out and record these seems a fitting object for the Society's efforts, and must offer valuable and instructive lessons to agriculturists generally. The Council are endeavouring to promote a continuation of these competitions by offering, in conjunction with the landowners of Shropshire and Staffordshire, similar prizes for the two best managed arable and dairy farms in a district to be hereinafter determined upon in connection with the Wolverhampton meeting.

The Council refer with satisfaction to the two numbers of the Society's *Journal* published during the current year, which contain papers of more than ordinary interest. The Report

on the Agriculture of Belgium especially calls for particular notice, as it is an able description of the rural economy of a country whose farming has been so frequently and so loosely described by agricultural writers, that a detailed and trustworthy account of the daily doings of Belgian farmers is a valuable addition to existing knowledge on the subject. It is very creditable to Mr. Jenkins that in the short period which has elapsed since his appointment as editor he should have made himself sufficiently conversant with both the science and practice of agriculture to be able to write a report of this high character.

In accordance with the Society's classification of implements for trial at the country meetings, machinery suitable for steam-cultivation will be tried at Wolverhampton. Keeping in view the increasing importance of steam power as a means of good cultivation, and especially as a means of improving heavy land, the Council have extended and developed the scheme of prizes hitherto offered for implements and sets of tackle suitable for steam-cultivation. In order to meet as far as possible the requirements of every class of agriculturists, they have decided to offer prizes for the best combination of machinery for the cultivation of the soil by steam-power, under three heads—viz.: 1, without imposing any restrictions; 2, limiting the weight of the engine to ten tons; and, 3, stipulating that the combination of machinery can be worked by an ordinary farm-engine, whether locomotive or portable. The president of the Society has still further extended this scheme by offering a silver cup, value £100, for the best combination of machinery for the cultivation of the soil by steam-power, the cost of which shall not exceed £700—the engine to be locomotive, and adapted for thrashing and other farm purposes. In this way the Council has endeavoured to include the whole subject, so far as concerns the sets of tackle; and, in addition, with a view to render the result as complete as possible, they have decided to offer a special prize for the best implement of each description suitable for steam-cultivation—viz., windlass, snatch-block or a substitute, plough, digger, cultivator, harrow, roller, drill, skim-plough or scarifier, root or stone extractor, and sub-soiler. They also offer a prize for the best implement or part of tackle not qualified to compete under the foregoing heads, and for the best combination of any two or more of the above-mentioned implements, not qualified to compete for the general prizes. The Wolverhampton prize-sheet further deals with the subject of steam-traction, and prizes are offered for the best agricultural locomotive engine applicable to the ordinary requirements of farming, and for the best waggon for agricultural purposes to be drawn by the above-mentioned engine. The Council have also decided to offer a series of prizes for implements and machinery used in the cultivation and management of hops.

The continued increase in the number of implements exhibited at the country meetings of the Society has again received the careful attention of the Council. They have decided that no exhibitor shall be allowed to enter duplicates of the same article, and that a maximum fine of 10 per cent. on the declared price shall be imposed for each article exhibited in breach of this rule; but that in no case shall the fine be less than £1. They hope that this step will have the desired effect of preventing any unnecessary extension of the exhibition without curtailing its usefulness or diminishing its interest.

The Council have received with much regret the resignation of Mr. C. E. Amos, the consulting engineer of the Society. In recording their high sense of the very valuable services which Mr. Amos has rendered to the Society during the 23 years that he has fulfilled the important duties of his office, they feel sure that they are expressing the general opinion of the members of the Society.

The regulations affecting the awards of medals to miscellaneous articles have also been revised, and it has been resolved that in future no medal shall be awarded to any implement included in the quinquennial rotation which is not placed in the classes tried at that meeting, nor to any miscellaneous article capable of trial until it has been subjected to such trial as the stewards may direct.

In the stock prize-sheet for the Wolverhampton meeting the Council have made further additions to the prizes which have hitherto been offered for live stock. In particular, they have added a fourth prize in the classes of Shorthorn bulls above one year old, but have somewhat reduced the amount

of the first prize; they have offered separate prizes for the two breeds of Guernsey and Jersey cattle; and they have decided to establish a series of classes for Cheviot and other mountain sheep. In order to ensure the purity of blood of the Shorthorns exhibited at the Society's country meetings, it has been resolved "that each animal entered in the Shorthorn classes shall be certified by the exhibitor to have not less than four crosses of Shorthorn blood, which are registered in the 'Herd Book.'"

The Council have been requested by her Majesty's Commissioners for the International Exhibition of 1871 to assist them in forming a collection of live specimens of the best breeds of animals whose wools are principally used in the woollen and worsted manufactures, by recommending breeders of good examples of the different classes of long-wool, short-wool, Down and mountain sheep. The Council have therefore placed in the hands of the commissioners the Catalogue of Stock exhibited and the lists of stock-prizes awarded at the last three Country Meetings of the Society.

The Council have fixed the commencement of the Wolverhampton Meeting for Monday, the 10th of July. The arrangements for the arrival and departure of the Stock, and for the opening and closing of the showyard remain the same as at Oxford; but as the trials of implements will be of an unusually extensive nature, it has been decided that they shall commence a fortnight before the show instead of a week.

During the past half-year, the Consulting Chemist of the Society has presented two quarterly reports on manures and feeding stuffs forwarded to him for analysis by members of the Society. These Reports, giving the names of the dealers and the analyses of the substances are regularly published in the Agricultural Journals as well as in the Journal of the Society. This publication has produced some dissatisfaction on the part of vendors whose articles have been analyzed; but the Council are prepared to defend their action in this matter, and believe that no part of their work is more valuable to agriculture than the analysis and exposure of inferior or adulterated manures and feeding stuffs. In several instances the dealers have made money compensation to the purchasers, and the Council regret that in some of these the purchasers have been unwilling to give up the names of the dealers, resting satisfied with the settlement made in their individual cases.

The variation in the quality of guano as now imported, has been under the consideration of the Chemical Committee, and a communication has been addressed to Messrs. Thomson, Bonar and Co., the agents of the Peruvian Government, suggesting that the guano trade might be regulated by some standard analysis, and that deductions from the price might be made according to the variations from such standard. Up to the present time, however, no satisfactory settlement of this matter has been suggested.

The Council have renewed the education grant for the year 1871 subject to the following alterations in the scheme which was tried this year:

1. That the next examination shall commence on Tuesday, April 18, 1871.
2. That the forms of entry, duly filled up, together with a certificate of general education, must be forwarded to the secretary by March 1, 1871.
3. That no candidate shall be eligible for the Society's prizes who has completed his 21st year previous to the said March 1; but that any candidate, irrespective of age, may compete for the Society's certificates.
4. That the prizes for aggregate merit, to be awarded to successful candidates who are eligible and are placed in the first-class, shall be: 1st prize, £25; 2nd, £10; 3rd, £5.

The Council have watched with apprehension the spread of rinderpest on the Continent. The establishment of water-side markets, the slaughter of cattle from the scheduled countries at the port of landing, and the inspection which the animals undergo before embarkation and after their arrival in this country, encourage the Council to hope that we may escape another outbreak of the cattle-plague in England.

By order of the Council,

H. M. JENKINS, Secretary.

Mr. NEILD, in moving the adoption of the Report, said he regretted to perceive that the number of members seemed not

to have increased, the number of life and annual members still being only a little over 5,000. If it were true, as he believed it to be, that the cause of the Society was that of the farming interest throughout the kingdom, the number ought to be at least quadrupled. He had noticed with some little concern the amount of loss connected with the Oxford meeting; but they must not estimate the shows altogether by the financial results, and he felt sure that if it should ever become necessary to make an appeal, with regard to funds, the Council would meet with a hearty response from the agriculturists of England. It was almost impossible to overestimate the beneficial results to British agriculture which would arise from the reading of the reports on the prize farms. A more interesting document had never been issued by the Council (Hear, hear). He did not like praising men to their faces, but he must say that their worthy secretary had earned the approbation of all the members by the able manner in which he had drawn up the report on the agriculture of Belgium (Hear, hear). That subject was referred to at the Farmers' Club on Monday evening, and, admirable as the details of continental farming were in some respects, what he had heard there as well as the reports on the prize farms showed that English farming would compare very favourably with that of foreign countries (Hear, hear). He observed with great pleasure the allusion in the Report to the trial of machinery suitable for steam cultivation at the Wolverhampton meeting. All the implement makers of the country would thus have their attention directed to the matter, and he hoped that important results would follow. He must say, in passing, that it was due to the President of that Society that they should all express their gratitude and delight at his noble offer of a prize of a silver cup of the value of £100 "for the best combination of machinery for the cultivation of the soil by steam-power, the cost of which shall not exceed £700" (cheers). He longed to see the day when the best kind of machinery would be at the command of small farmers. Large farmers could take care of themselves, but there were many small ones who could not avail themselves of the best machinery at the present prices. He was glad to see what the Council said about duplicate implements, the exhibition of which had become such a serious evil that it was absolutely necessary to put some check upon it. They must all concur in the Council's regret at the resignation of Mr. C. E. Anon, the Consulting Engineer of the Society, who had for many years rendered valuable service (cheers). He was glad that so much attention had been paid to the adulteration of manures and feeding stuffs. Such adulteration was not merely a commercial wrong; it was a moral injury for men who had dealings with farmers to practice deception upon them with regard to the quality of seeds or manures. An ordinary loss arising from trade practices might be rectified in a month; that was a loss which extended over a year, and the injury to the farmer and his family was very serious. No doubt what had occurred would cause farmers to exercise greater caution with regard to those of whom they purchased, and he thought they were very much indebted to the Council for endeavouring to secure fair-dealing (Hear, hear).

Mr. ROBERTS, in seconding the motion, said he considered the Report eminently satisfactory; while even as regarded the number of members—the only point on which the previous speaker complained—he reckoned that there was an increase of 71. The number of life members had been augmenting for several years past. It now amounted to 1,547, and that showed the necessity of having a considerable funded capital, seeing that those 1,500 members would during their whole life be receiving the *Journal* and other advantages without paying anything for them. The Council did not appear to have recently increased the amount of funded property, and he thought that fact would be viewed with satisfaction. What they desired was, he believed, to store up knowledge and information for the present and future generations, and not to accumulate money unnecessarily. He noticed in the Report that the Council were determined not to rest satisfied with those achievements of the past which had done so much good, but were introducing new elements. The scheme of giving prizes for the best-managed farms would, he thought, prove exceedingly useful. Hitherto the Society seemed to have almost confined itself to encouraging improvements in breeding of animals and the manufacture of implements. In both of these it had been very successful, but he hoped it would be equally so in giving direct encouragement for the improved cultivation

of the soil itself. He would suggest to the Council whether it might not be desirable in some way to give direct encouragement to persons who were experimenting with a view to improved cultivation. As he heard Mr. Jenkins read the paragraph in the Report, which related to the *Journal*, he could not help being struck with a contrast between that year and two years ago. When they were first told that a new secretary had been appointed, the feeling excited by the announcement was very different from that which he believed was now universal—he meant the feeling that the *Journal* itself, not merely Mr. Jenkins' paper, but the *Journal* itself was throughout a success. It was valuable and not dull (cheers). Mr. Jenkins had succeeded excellently as editor, and had established himself within a very short time in the good opinion of the members (Hear, hear). He (Mr. Roberts) thought they might expect great benefit from the prizes offered for steam cultivation by their president, and it was gratifying to find that such encouragement would be given at Wolverhampton to that department. It would also be a great advantage to limit the size of the show-yard in some measure, by excluding duplicates. At the Oxford meeting he felt that the increasing extent of the show yard was becoming a serious evil. He would suggest that an exception should be made in the case of implements which were intended to compete for prizes—that it should be made compulsory to exhibit such implement, and that they should be shown by themselves, say, in one acre out of seventy, and should be accessible only to members of the Society. It was highly inconvenient to have to hunt about in all directions for what you were looking for, and he thought the arrangement which he suggested would be satisfactory, both to members and exhibitors. As regarded the publication of the reports of the analyses of food and manures, he thought that, though it might not have been very pleasing to some traders, it could hardly have given dissatisfaction to the consumers (Hear, hear). When they found that acts which were clearly dishonest were justified on the score of their being part of the customs of the trade, the defence being to the effect that it was generally the practice of the great body of the trade to humbug the farmer, and therefore each individual was justified in humbugging him (laughter), it was high time for that Society to take the matter in hand. He would suggest for consideration whether the publication of adulterations of seeds should not be added to that of adulterations of manures (Hear, hear). He was sure that any efforts of that kind would meet with the cordial approval and support of all the members, and if they were thus enabled to secure a good quality of manures, of feeding stuffs, and of seeds it would be a great boon. He was glad to find that the Council intended not only to continue the education grant but also to admit candidates over 20 years of age to competitors for prizes. In conclusion, he must express his satisfaction that the danger of the introduction of rinderpest appeared to have been averted partly through the care with which the Council had watched over their interests (cheers).

Mr. SIDNEY, the Secretary of the Agricultural Hall Company (Limited), said on the last occasion that he attended a meeting of the Society he felt it his duty to make some very strong observations on the principle on which the Secretary had been elected. Since that time he had had the honour of making the acquaintance of the Secretary, and had watched the course which he had pursued; and while he retained his opinion on the question of the mode of election, he must do full justice to the industry, the energy, and the intelligence with which that gentleman had performed the duties of Secretary and sub-editor; he said sub-editor because it was perfectly childish to imagine that a gentleman, however intelligent and however highly educated, who came there two years ago with his mind like a blank sheet of paper, was now in a position to instruct the farmers of England on the subject of agriculture. He should not have risen had it not been for that paragraph of the Report of the Council which called attention to the Report which had appeared in the *Journal* on the agriculture of Belgium. There was a very important omission in that paragraph. No doubt Mr. Jenkins was just the man whom any one would wish to have under him for the purpose of sub-editing such a Report; but he prepared that document in conjunction with Professor Voelcker, who had spent 20 years in studies of that

kind, who was thoroughly up to the science and practice of agriculture, and whose words were received with respect north and south, east and west (Hear, hear). It was Professor Voelcker's Report, and not Mr. Jenkins's. That Mr. Jenkins had acquired sufficient knowledge of the science and practice of agriculture within a couple of years to deal with practical questions of agriculture was too absurd a notion for anybody to entertain. He thought, however, they had been exceedingly fortunate in obtaining such a Secretary (cheers), and before leaving that room he should perhaps suggest a little work for the Secretary to do which was congenial to the spirit in which he had carried out his duties. But he could not sit there and hear Professor Voelcker passed over or to hear it impliedly suggested that the observations which he made at a former meeting with regard to the election of the Secretary were not founded in fact.

Dr. VOELCKER: Allow me, my lord, to say one or two words. I am very much obliged to my friend Mr. Sidney for mentioning my name in connection with the Belgian Report; but I hope it will not be regarded as an expression of mock modesty if I give full credit to my friend Mr. Jenkins for his share in drawing up that document (cheers). I can with great propriety and honesty say that he had the lion's share. My part in the business was more in acting as an interpreter than as a composer of the Report (Hear, hear). I did what I could to assist Mr. Jenkins; but after all, much credit is due to him. I wish to acknowledge that publicly, because my name has been associated with his, and because the chief credit which I take with respect to the journey to Belgium is that of having acted as an interpreter (cheers).

Mr. THOMPSON: I should like to say one or two words on different points which have been referred to by gentlemen who have spoken. First with regard to the number of members. The gentleman who moved the adoption of the Report said it did not quite appear whether there was an increase or a decrease in the total. There is a slight increase, but it is so small that, practically, the numbers remain the same as before. I think the addition to the total is 12. I quite agree with him that there might with advantage be a large increase in the number of members; but I really should not like to ask the tenant-farmers of England to come and subscribe. They are the best judges as to how they ought to spend their money, and whether the advantages to be gained by joining this Society are sufficient to induce them to subscribe or not (Hear, hear). I think we can show results which are satisfactory so far as they go, and would bear extending very much with benefit to agriculturists themselves. If they think so they will no doubt join the Society in greater numbers. We go on in a steady course, trying to improve and to take the lead in agricultural matters. If we succeed in convincing farmers that we have done so they will no doubt join us, but we don't think it necessary to go round with the begging box (Hear, hear, and laughter). Now as to the investment of funds, the gentleman to whom I have just alluded remarked that we had not much increased the permanent fund. It is true that £20,000 is about the amount which had been invested some years ago; but there were two or three years in one of which we had no exhibition owing to the cattle-plague, and in one or two more of which we held our meeting in places which were less populous than some others which we had visited, the result being that, because the receipts were diminished, we were obliged to draw upon the fund. But the effect of the Manchester meeting was to restore the permanent fund to £20,000, and give us a reserve show-fund of £4,600, which is practically an addition of nearly £5,000 to the permanent fund, I mean as contrasted with the actual income intended to be drawn upon if the receipts fall below the amount necessary to keep up the average amount of the prizes and the average expenditure of the Society. The object of having a permanent fund at all is clearly to make up for a bad year or two; for it was never contemplated by the founders of the Society, nor would it be thought desirable by the members that we should invest so large a sum that the annual income arising from it would make the Society independent of the annual subscriptions of members (Hear, hear). It is clear that a Society of this kind ought not to continue to exist if its operations are not sufficiently useful to secure the support of a large body of the leading agriculturists of the kingdom (Hear, hear). That is what the Council ought to look to as their regular means of support, while the permanent

fund is merely a provision for meeting any unusual deficiency which may exist from time to time. Now in order to prove what I said just now, namely, that the operations of the Society are of great use and benefit to the agricultural body, I will venture to allude to two points which are made prominent in the Report, and which are just now points of special interest to agriculturists. One is the new work lately begun by the Society of ascertaining results already attained, whether by offering prizes for the best managed farms, with a view of giving a detailed account of different modes of management, the prize being obtained by open competition against neighbours in the district, or by sending out on a tour of inspection men who are competent to examine different representative farms in different districts, and give an account of them to the public. That I call a record of results already attained. Such records are very valuable, but they are also very expensive. The cost of sending round gentlemen to prepare reports is very serious, and it is only when the Society is in a good position as regards funds that it can undertake work of that description in addition to the ordinary show (Hear, hear). The accounts of what have been done when they are clearly understood, and when they relate what has proved successful, are an encouragement to others to go on improving, and point out to them the way of improvement. I believe that nothing is more likely to prove advantageous than this increase and extension of steam cultivation. Our President, Lord Vernon, has very liberally, and as I think very usefully, offered a prize for steam apparatus adapted to be generally used by farmers not holding very large farms, nor possessing very much capital. Men of very large capital can of course afford to provide themselves with any sort of apparatus which they may think likely to prove useful. I could mention one tenant-farmer who having one double set of Fowler's steam apparatus has this year ordered a second double set. But this is an exceptional case. The occupiers of moderate-sized farms can generally only obtain the advantage of steam cultivation by means of an apparatus to be purchased at a not inordinate cost, and which will not only cultivate the limited number of acres on the farm that require to be cultivated, but may also be used for thrashing and chaff-cutting, and be easily moved from one part of a field to another, in fact be a generally useful slave (laughter). If we can obtain general efficiency and have a thoroughly-useful servant for a cost which is put down as the limit of competition for Lord Vernon's prize, we shall then have made considerable progress towards enabling a man holding a moderate-sized farm to purchase steam machinery for himself (Hear, hear). But, then, there is the case of small farmers. These will certainly not be able to buy at all (Hear, hear). But there are companies—and I am happy to say that they are increasing and extending very much—for letting out steam implements for hire; and I have sanguine hopes that these societies will enable even small farmers to use steam apparatus (Hear, hear). I heard yesterday of one company, my informant being one of the principal promoters, which had thirty sets of steam apparatus at work last autumn: that looks like business (Hear, hear). There are one or two northern counties—I may especially instance Cumberland—in which such companies are getting at work; and I hope that we shall soon see steam cultivation becoming as general as it ought to be (cheers). Mr. Sidney considers it a very absurd idea that a gentleman who has only been for two years secretary and editor should have written a report like that on Belgian agriculture [Mr. Sidney: "No, no"]; nevertheless, it is a fact that he did write that report; and therefore in the official Report which has just been read no reference is made to Professor Voelcker's valuable assistance in the course of the Belgian tour; but reference is made to the report itself, the writing of which was the work of the secretary and editor; the Council thus calling attention to that fact, which, by anticipation, was said to be absurd by other gentlemen as well as Mr. Sidney, and showing that what was said to be absurd by anticipation is proved by the result to be an established and accomplished fact (laughter). Professor Voelcker's knowledge of the language, which he has very modestly stated to be his principal recommendation, was by no means his principal recommendation (Hear, hear). His knowledge of geology, his knowledge of science generally, was extremely valuable (Hear, hear). It is certainly far from the wish of the Council to depreciate or undervalue in any way the

services of Professor Voelcker (Hear, hear). On the contrary those services, which have been so frequently alluded to before, are prominently referred to in the present report in connection with the analyses of feeding stuffs and manures. But it is a fact that Mr. Jenkins wrote the report on Belgian agriculture, and it is a very creditable report to us. No one can read that report without feeling convinced that both Mr. Jenkins and Professor Voelcker saw all that was to be seen of Belgian farming, and that Mr. Jenkins had faithfully described what they saw. Now, looking at the way in which Belgian farming has been publicly alluded to by various persons, considering what inaccurate descriptions have been given of it, and the assumption that what was found in one particular place prevailed all over the country, I must say it is satisfactory to us to have this fresh proof that the agriculture of England will compare favourably with that of other countries (cheers). Gentlemen may hold and express what opinions they please with regard to Belgium; but the facts are there and cannot be disputed (Hear, hear). I should not have alluded, perhaps, to this subject again, had it not been so positively asserted by Mr. Sidney that the principle on which the secretary was elected—[Mr. SIDNEY: "The editor."] I call him the secretary, and if I were also to call him the editor it would be a true description—was wrong. That gentleman was elected on this principle: We advertised for applications. We had no preconceived knowledge of Mr. Jenkins: his testimonials were received and considered in common with all the others that were sent in. A selection was made of a certain number of candidates, I think there were eight or nine at least of those whose testimonials looked best. A large committee of our body, of which I had the honour to be chairman, sat and had interviews with all those gentlemen whose testimonials had been selected as being best; and, after having an interview with each of those gentlemen, the committee were unanimously of opinion that Mr. Jenkins would make the best secretary. Now I would ask Mr. Sidney, or any one else, to point out any way which was more likely to secure the best man among those who applied for the office (Hear, hear). I have defended the course pursued before, and I still think that no better one could have been followed.

Sir J. H. MAXWELL said he was glad to hear Mr. Sidney's remarks, especially as the effect had been to make them happy all round (laughter). Even if Mr. Jenkins were not eligible at the time when he was appointed, he had proved himself so now. He had shown himself to be an eligible secretary, and, as regards his ability as an editor, all acknowledged that the Belgian Report was an admirable one. The popularity of that Society was on the increase, and he believed it would receive a great impetus from the course recently pursued with regard to the adulteration of manures and feeding stuffs. The necessity for such proceedings was manifest. He recollected a case in which a tenant of his (a widow) was offered, by a man with a dog-cart, some guano which he represented as "Gibbs' true Peruvian," and which his factor, who happened to be present, found to consist one-half of feathers (laughter). It was most satisfactory to find that that great Society was now endeavouring to prevent imposition from being practised upon the farmers of Great Britain.

Mr. W. BOTLY said: Some years ago he suggested that the subscriptions of those who had been paid for twenty years should be reduced, and he was glad to learn from the present Report that that hint had not been forgotten. As regarded the *Journal*, every one who had read it for the last two years must have observed a great improvement. It was a more popular and readable periodical than it ever had been before. He was gratified to find that the Council had renewed the education grant; and he thought the improvement of the special education of agriculturists, from the highest to the lowest, would be a proper application of any surplus, after paying due regard to the case of life governors.

Mr. MARTIN wished to allude to what was said in the Report about the adulteration of artificial manures. Having become a member of that Society within the last twelvemonth, he determined to have his manures analysed. His consumption of cake amounting to about £1,500 in the course of the season, it was of course a matter of considerable consequence to him that he should not be deceived. Within the last three months he had sent up three samples of cake to Dr. Voelcker to be analysed; and of these, two were reported upon as pure, and

the third as adulterated with beech and earth-nut. He thought that fact should be known. The person who supplied him with what was adulterated afterwards excused himself by saying that he had two sorts of cake, and that in that case when the men had left off making the best sort and proceeded to manufacture the second quality, the man who was especially engaged in the work forgot to remove the impression (laughter), so that the impression was used alike for both qualities (renewed laughter). Ultimately there was an amicable arrangement, and he having paid £12 a ton for the cake, the manufacturer agreed to return £3 a ton or £15 for five tons.

Mr. MARK PHILIPS wished to call attention to a subject which had recently been one of special interest. Probably there was scarcely any gentleman present who had not suffered more or less during the excessively dry seasons of 1868 and the last summer for want of water (Hear, hear). That seemed to him a most important question for farmers to consider. It was for landlords to provide proper means of obtaining a supply of water, but it was for tenant-farmers to maintain the supply. He had that morning received from the manager of a large estate in Northumberland a letter drawing his attention to the fact that owing to the increase of drainage there had been created in many instances a want of water for farming purposes (Hear, hear), and it was of real importance that farmers should in future look not merely to the discharge of water from the land but also the keeping up the supply required for general farming purposes. With the increased use of steam-engines there was an increased demand for water to supply the engine. In connection with the offering of prizes for the best-cultivated farms he would make it, to use parliamentary language, an "instruction to the committee" that those who inspected the farms should have respect to the water supply found on the farm itself (Hear, hear). He had seen many instances of great loss through farmers being compelled to cart water. Some of the first agriculturists in the kingdom had been obliged to cart water two or three miles daily, employing three or four horses, which were wanted for other purposes on the farm; and he knew a case in which a miller was so jealous of every drop of water that he would not allow a single barrel to be taken from the mill-race until, as he said, he had done with it (laughter). He thought those who were employed in inspecting farms on behalf of that Society should always have respect to the supply of water in dry seasons.

Mr. NEILD said, he should ill-discharge the debt due from Manchester to that society if he did not acknowledge the kind and noble manner in which the Council assisted the Manchester Committee in getting out of debt. He believed that if the Society should ever come to Manchester again they would not stand in need of such help.

The PRESIDENT: Gentlemen, it would be unbecoming in me to put the motion for the adoption of the Report to the meeting without making a few preliminary observations. I feel very much that there are many of my colleagues, right and left of me, who are far more entitled by their knowledge of agriculture to hold the position which I occupy. I have been elected to the position only because of my having served a considerable time on the Council, and being fairly conversant with the Society's business. But having been elected, I must fulfil my duties to the best of my ability; and it is not only a great pleasure to myself, but to all my colleagues to meet the gentlemen who attend the half-yearly and annual meetings of this Society. There is no doubt that the comparison of opinions between the general body of the Society and those who represent them in the Council are very useful in eliciting the views of the agricultural public generally; and I hope it needs no assurance on our part that any remarks which are made in this room will always be properly considered at the meetings of the Council. The Council, indeed, would fail very much in its purpose, if it did not in some way reflect the opinions of the agricultural public outside; and I have no doubt at all, from the various endeavours that we have made to promote investigations, and to excite competition at our agricultural shows, that we have fulfilled in great measure, at any rate, the wishes of the public out-of-doors. I cannot help agreeing in the observations which have fallen from different speakers with regard to the number of members of which the Society is composed. It is not our province, as Mr. Thompson has very properly observed, to seek to draw members to the Society, excepting by the proper fulfilment of our duties; but when I consider

the great advantages which are offered to the agricultural body, I confess that I am somewhat surprised that the Society is not more generally supported than it is (Hear, hear). Having, as I said, been a member of the Council for some years, I am perfectly aware of a growth of confidence out of doors in the proceedings of the Society. At any rate, however much opinions may differ on that point, no one can possibly deny that at our shows there has been a much larger exhibition of agricultural stock and implements, and a greater number of exhibitors. So much so, that we have found it necessary very properly to limit the number of articles exhibited, and certainly in my opinion not before it was required. When, on going through the Oxford Show, I saw on one side a steam launch and on the other a very large greenhouse, which occupied an enormous space, I do not think the Society has done wisely in exhibiting such articles as those (Hear, hear). I omit all mention of smaller items, such as hundreds of sausage-machines, poaching-nets, and a variety of other articles (laughter). Nevertheless, the show at Oxford was, I think, eminently successful; and that a success which lay not in the financial results, but in the larger and more important result of bringing landlords and tenants together, and in having a real good exhibition of implements and stock (Hear, hear). Reference has been made to the farm-prize competition, and upon that subject I intended to have offered a few remarks; but Mr. Thompson has gone so fully into it, that I shall not occupy your time further than to say that in my opinion there is no action which the Society has taken which will more conduce to competition among farmers for excellence in the management of their farms than the desire to acquire the rewards of merit which the Society can confer upon them. Mr. Jenkins, as the secretary of the Society, has been so thoroughly deceptive for three years that I think it would be charity on my part to say nothing about him (a laugh). With this exception that, in the paragraph which refers to him at the close of the Report, I most cordially concur, believing as I do that no person could more efficiently in every way perform the laborious duties which belong to his double position. And as it seems that our Society depends in great measure on the high character and ability of the officers who serve under us, I think it must be as agreeable to the members of the Society present to-day as it is to us to have found how very well, and without any jealousy, the leading officers of the Society, Dr. Voelcker and Mr. Jenkins, appear before you in the remarks which have been made. Sufficient has been said with regard to the admirable article on Belgian farming; and as the owner of land in a dairy district myself, I cannot help expressing my acknowledgments to the Society for the investigations which have been carried on with regard to the development of dairy produce of all sorts. I have on my right a friend who thinks that I, and the Council too, must have gone crazy on the subject of dairy produce, but in my opinion there is no agricultural question of much greater importance than the development of the cheese factory question, which has been forced upon the county in which I reside by the enormous competition that has come so suddenly upon us from the United States of America; and that threatens to swamp all those, and they are a very large class, who produce very moderate cheese here (Hear, hear). With respect to the investigations which have been carried out in the matter of adulterated manures, I may mention one circumstance which appears to me to be conclusive as to the value of the position which the society has taken up in regard to it. Yesterday Dr. Voelcker presented his report to the Chemical Committee of a great many analyses of bone manure which he had made during the past quarter, and all of which he reported to be "pure." In previous reports he had mentioned many cases in which manures were considerably below their professed value, and one or two cases where they were absolutely worthless (Hear, hear). It was my intention to have alluded to the question raised by the last speaker but one (Mr. Mark Philips) the storage of water. The agricultural public, I fear, are not aware that this society has published in its *Journal* a very valuable article on that subject. No one can say, therefore, that we are behind on this question; for it was three or four years ago that that article—an admirable one, written by Mr. Bailey Denton—appeared (Hear, hear). The fact is that we are rather apt, when we get into winter, to forget what has happened in the summer; but if the summer

comes upon us again with such a severe drought as we have had this year, we shall have to sit in sackcloth and ashes. If, then, the agricultural public would read and consider that article of Mr. Bailey Denton, they might obtain many useful hints from it for the economical storage of water (Hear, hear). Before I conclude these observations, I should like to be allowed to express my own great personal regret at the loss by the Society of the valuable services of Mr. Amos. Like many of my colleagues on the Council, I served my term of office as a steward of implements some years back; and if there was one thing which then struck me more than another, it was the zeal and integrity with which Mr. Amos fulfilled his duties. In fact, I may add that the value of our trials has depended entirely upon the confidence which the exhibitors reposed in Mr. Amos's decision. They looked upon him "as Caesar's wife, above suspicion" (cheers). And I can only trust that the Council may be led to make as wise a selection of an engineer to succeed Mr. Amos as they did when they selected him (Hear, hear). When next we meet I hope it will be under more hopeful circumstances with regard to the condition of affairs abroad (Hear, hear). And I do not think that we ought to conclude our meeting to-day without expressing our great regret that countries with which we are on intimate terms of intercourse, both on business and pleasure, should be engaged in so suicidal a contest (cries of "Hear"). I have only to add that I thank you sincerely, gentlemen, for having listened so patiently to these remarks (cheers).

The report was then adopted.

Mr. TORR, in moving a vote of thanks to the auditors, said the real increase in the number of members was 197. It had been found necessary to strike a great many off the list, on account of arrears of subscriptions; but the arrears were now small in point of money value, and the acceptance of £5 as a life subscription in the case of persons who had been members for twenty years would probably add considerably to the funds. They must not expect that all the shows would be as profitable as that at Manchester. The loss of £2,000 at Oxford showed the difference between going to populous and going to non-populous places. The Wolverhampton people were behaving very liberally, having offered on the previous day special prizes amounting to £1,000, and he trusted that when it went into South Wales in the ensuing year the Society would meet with a hearty welcome. What the chairman had said about churning was, in some degree, a matter of joke with himself. He (Mr. Torr) did think that the president and the secretary had done a good deal of churning lately (laughter); and they had that day churned out of the meeting its good opinion very successfully (renewed laughter, and Hear, hear). If the result of the churning should be that English-dairy farmers made a good deal more by cheese producing than they had done, he hoped other farmers would be taught how they might make something by corn (laughter). As regarded Mr. Jenkins, he must say that he was one of the most apt scholars in collecting practical information he had ever met with, while no man could be more free from prejudice or anything that might tend to prevent information from growing serviceable (Hear, hear). Some years ago he (Mr. Torr) went over nearly the whole of Belgium, and the report of Mr. Jenkins and Professor Voelcker on Belgium farming fully agreed with what he then witnessed. They had been told for years that they should go to Belgium to learn farming. Belgium was well cultivated, so far as small tillage went; but the best agricultural labourers of this kingdom lived very much better than the Belgian farmers (Hear, hear); and if the latter lived as well as the former they would have very little produce to send out of Belgium; they would consume it all themselves. The Belgians were a very industrious, very clever, and very happy people; but they lived on very small means, and their farming would not bear comparison with that of England. As regarded steam cultivation, he thought the cheapest way of proceeding was to adopt the hiring principle. He himself hired for his thrashing, his grinding, and his steam culture, and found that system very beneficial. What had been said at that meeting about the storage of water was very important. In Hampshire and Berkshire he had found the greatest providence as respected water, and the cause was that in those counties there was great necessity for providence. There were in those districts many good standing ponds made of marl and the refuse of the gashouse.

Mr. W. BOTLY seconded the motion, which was then put and carried; and the auditors were re-elected.

The CHAIRMAN having inquired whether any member had any suggestion to make to the Council,

Mr. SIDNEY moved the following resolution: "That the Council be requested to take steps for obtaining a complete report on the progress of agriculture in England since the Society was founded in 1839." As to the mode in which the investigation should be conducted, what he would suggest was that the Council should divide England into a certain number of agricultural districts; that there should be a committee to draw up a series of questions upon live stock, upon implements, upon the chemistry of food and manures, and upon every other branch of agriculture; and that those questions should be printed and circulated among all the members of the Society, say in the autumn, so as to allow the whole of the winter for farmers to prepare the answers. It must be recollected that since that Society was founded there had sprung up a large class of intelligent farmers who were well able to write on agricultural topics, and the Council should endeavour to utilise the members. It was in a similar way to that—that is, by sending out a number of questions, that he prepared for publication his work on the pig.

The CHAIRMAN promised that this suggestion should receive the full consideration of the Council.

Mr. RICHARDSON said he hoped the Council would try and obtain some definite answer from Messrs. Bonar and Co. to the questions relating to guano. At present there was no guarantee of quality, nor were samples given, so that no one could tell what he would obtain for his money.

The CHAIRMAN observed that there was a paragraph in the Report relating to that subject.

Mr. RICHARDSON: I suppose Messrs. Bonar have not received any communication on the subject?

The CHAIRMAN: No; but they are in communication with the Peruvian Government.

Sir J. MAXWELL, in conveying a vote of thanks to Lord Vernon, observed that no one could doubt that his lordship had rendered great service to agriculture, not merely in the churning district, but elsewhere (laughter and cheers). He hoped his lordship would allow him to conclude with his own family motto: "*Vernon semper viri*" (cheers).

Col. CHALLONER, in seconding the motion, said the Society had had a great number of presidents, many of whom had been very active; but there were very few who had paid more attention to the duties of the Council than Lord Vernon had done during the last five or six years. They had had that day an illustration of the earnest manner in which his lordship dealt with the different subjects which came before him for consideration; and they could not do otherwise than give him a unanimous and cordial vote of thanks for his conduct in the chair and his zealous and constant attention to the affairs of the Society (cheers).

The resolution having been put by Sir J. Maxwell, and carried by acclamation,

The CHAIRMAN said: Gentlemen, I shall not detain you more than one minute, but I hope you will not think that paucity of words implies that I am not deeply sensible of the honour conferred upon me. I can only say that in the performance of my duties as President it is a great encouragement to me to have been received with so much kindness by you, and to have heard an old member of the Council speaking in such terms of approval of my conduct (cheers).

The meeting then separated.

ANNUAL REPORT OF THE CONSULTING CHEMIST FOR 1870.

The publication of the periodical reports of the Chemical Committee has awakened the agricultural community to the painful fact, that oilcakes, as well as artificial manures, are frequently sold in an adulterated condition, or at prices much exceeding their real commercial value. The analytical work in 1870 has increased in an unprecedented degree, no doubt in consequence of the issue of these reports. Before 1868 the average number of analyses for members was about 330, for

1867 it amounted to 341. A considerable increase took place in 1868, when 432 analyses were made for members of the Society, and again in 1869, when 465 analyses were sent out from the laboratory. Notwithstanding this steady increase in the three preceding years, as many as 580 analyses have been referred to me during the past year, being an unprecedented increase of 115 analyses over the number sent out in 1869. The appended summary shows that a large number of guanos and artificial manures of the class of superphosphates were examined in 1870, as well as an unusually large number of oilcakes. Comparatively few of the guanos were adulterated, but many were found damaged by sea-water and of inferior quality. On an average the proportion of ammonia yielded by the guano analysed in 1870 little exceeded 14 per cent., and in several cases the proportion was less than 13 per cent. It is to be hoped that the supply of guano from the Guanape Islands will turn out to be of a superior quality than has been anticipated. I have recently made a number of analyses of Guanape guano for the Peruvian Government, and am glad to be able to report that nearly all the samples were much drier than those analysed in the preceding year. Although not equal in quantity to the best Chincha Island guano of former years, the Guanape Island guanos recently analysed by me are about equal to the average quality of last year's importations of Peruvian guano. It remains to be seen whether Guanape guano, which no doubt will be sold as Peruvian, is uniform in character. By far the greater number of artificial manures—such as special wheat, oat, barley, potato, and grass manures—are mixtures of dissolved bones or superphosphates with ammoniacal salts, common salts, dried blood, nitrate of soda, and other nitrogenous fertilising materials. These manures are, therefore, grouped together with superphosphates. As many as 152 samples of superphosphates and similar manures were analysed by me in 1870. Large sums of money are annually expended in the purchase of phosphatic manures, and as the quality of these manures varies exceedingly, and the actual price at which they are sold does not always correspond with the intrinsic value of the manure, it is highly desirable that purchasers of superphosphate or dissolved bones should buy these manures of a quality guaranteed by analysis. The following analyses of two superphosphates offered for sale in the same place, one at £6 3s. (cash) per ton, and the other at £4 3s., afford a good illustration of the fact that a considerable saving may often be effected if the composition of rival superphosphates is determined previous to the purchase:

Composition of Two Superphosphates.

	No. 1. Sold at £6 3s. nett cash.	No. 2. Sold at £4 3s. nett cash.
Moisture	15.38	18.92
Water of combination and }	9.45	6.21
*Organic matter		
Biphosphate of lime (mono-basic phosphate of lime)	13.04	15.66
Equal to bone phosphate (tri-basic phosphate of lime) rendered soluble by acid	(20.42)	(24.52)
Insoluble phosphates	13.25	5.14
Sulphate of lime	43.10	47.37
Alkaline salts and magnesia	1.03	.86
Insoluble siliceous matter	4.75	5.84
	100.00	100.00
*Containing nitrogen33	.08
Equal to ammonia40	.09

These two superphosphates have nearly the same commercial value. No. 1 contains a little bone; No. 2 is a purely mineral superphosphate. I should feel disposed to give from 5s. to 7s. 6d. more per ton for No. 1 than for No. 2. The sample marked No. 1 is rather dear at £6 3s., nett cash, and No. 2 cheap at £4 3s., nett cash. Of the 32 samples of bone dust not one was adulterated, which clearly shows that the unsparing publication of the names and addresses of dealers in adulterated bone dust has had an excellent

detering effect. With respect to feeding cakes, I regret to have to report that linseed cake is still sold as genuine and pure, which is largely mixed with rice meal, oat dust, pollard, mill-sweepings, earth-nut cake, cotton cake, and sometimes with more objectionable materials. Linseed cake, when mixed with rice dust or pollard, is generally comparatively poor in flesh-forming matters, as will be seen by the following analysis of a sample of cake which was found adulterated with oat dust :

Composition of a Sample of Linseed Cake, adulterated with Oat dust and similar starchy mill refuse.

Moisture ...	14.72
Oil ...	12.0
*Albuminous compounds (flesh-forming matters) ...	23.25
Mucilage, sugar, and digestible fibre ...	35.57
Woody fibre (cellulose) ...	8.24
Mineral matter (ash) ...	6.18
	<hr/>
	100.00
	<hr/>
*Containing nitrogen ...	3.78

It is, however, quite possible to supplement the deficiency of flesh-forming matters in a cake adulterated with starchy mill-refuse by incorporating at the same time with the cake a meal richer in nitrogen than pure linseed cake. Decorticated nut cake or decorticated-cotton cake, being very rich in nitrogen, is sometimes used for that purpose, and the blending of the starchy matters poor in nitrogen with others abounding in that element is so skilfully performed by some notorious cake-crushers, that a cake is produced having almost precisely the same proximate composition as pure linseed cake. It is well to bear this in mind, for the fact that an oilcake on analysis shows the same per-centage of oil, flesh-forming matters, woody fibre, &c., as pure linseed cake, is no proof that it may not be, after all, a mixed cake, and be composed of materials inferior in taste, digestibility, and condition to pure linseed cake. Excellent decorticated-cotton cake is sent over to England from America at the present time. When broken up fine, or, better still, when reduced to a coarse powder, decorticated-cotton cake is a most valuable feeding cake for store cattle, when these have to be kept chiefly upon straw chaff and a few roots. A mixture of finely-ground cotton cake or meal, linseed cake, and Indian corn, or palm-nut meal in equal proportions is also well adapted for fattening stock, and for milk cows, good decorticated-cotton cake is preferred, I believe justly to the best linseed cake. Green German rape, or Rubsen cake continues to be scarce, and ordinary rape cake is often so full of mustard that it endangers the life of the animals to which it is freely given. Common rape cake should therefore never be given to stock without having been previously examined for mustard. Most of the samples of common rape cake sent for examination I found utterly unfit for feeding purposes, and I would especially warn the members of the Society not to buy a variety of rape cake which has recently found its way into commerce under the name of yellow rape cake. Several samples of this species of cake I found so pungent that, in my opinion, less than half a cake would in all probability kill an ox. Satisfactory reports of field experiments on root crops, on potatoes, and on grass land, have been received, and will form the subject of future contributions to the *Journal*. I may observe, however, in this place, that potash-salts have again proved to be very useful, in 1870, for potatoes and mangels as well as for clover seeds, and not only when used upon light sandy soils, but likewise when applied in conjunction with superphosphate to poor clay land. The following are the papers contributed by me to the pages of the February and August numbers of the *Journal* for 1870 :

1. Field experiments on mangels.
2. On beet-root pulp.
3. On a peculiar kind of Swedish whey-cheese, and on Norwegian goat's-milk cheese.
4. Field experiments on potatoes.
5. On the composition and practical value of several samples of native guano prepared by the "A.B.C." process of the Native Guano Company.

(Signed) AUGUSTUS VOELCKER, F.R.S.	

THE DOUBLE PLOUGH TRIALS AT ALFORD.

JUDGES' REPORT.

TO THE COMMITTEE OF THE ALFORD AGRICULTURAL SOCIETY.—Gentlemen,—Your Judges feel much the responsibility of having to report on the double-furrow ploughs, tried at the Alford meeting, held on Friday, the 12th instant, in a field of Mr. W. O. Parr's, of Well. The day was a most unfortunate one as regards weather, snow and rain falling, more or less, the greater part of it; this, with the aid of a slight frost during the previous night, brought the surface of the trial-field into a state more easily imagined than described. The field was a strong loam on a clay subsoil: in the face of this the ploughs went through their severe trial, some of them making excellent work. Everything considered, we are of opinion the trials were most satisfactory. There were eight double-furrow ploughs put to work in your trial field, some drawing three horses, others only two. In practice we consider three horses ought always to be used. That double-furrow ploughs will quickly come into use on lands not exceedingly strong may with safety be predicted, as a plough of this description, with three horses and one man, will do quite as much work, and as well, as two single ploughs working each two horses and one man; thus producing a saving to the farmer of one horse and one man. We are also of opinion that, although it is quite practicable to set a ridge and take up a furrow with a double plough, it would be better if these two operations were done with a single plough. In a double-furrow plough there are several points to be taken into account, amongst them strength, draught, simplicity of construction, and ease in management, and though last, not least, the handiness in turning at the headlands. Some of the ploughs at the trial met all these requirements—others did not; and it was proved beyond all doubt that only the strong, rigid, and well-made ploughs can go through their work satisfactorily. It is much better to have an excess of strength and weight than to have an implement not strong enough for its work, which, on meeting a little extra resistance, gives either one way or the other, causing the plough to run out of work altogether, or bury itself up to the beam. This was shown to demonstration, both in your trial field and at the Peterborough meeting, at Thorney, a short time since. As regards the work by some of the double ploughs at your meeting, it was indeed excellent. The work by Howards' plough was very good, both in appearance and fact; and that by Ransomes' and Co. but little inferior. Had we not been by our instructions directed firstly to take the draught of the plough into consideration, the position of these two great plough manufacturers might have been transposed. The draught of Messrs. Ransomes' plough by the dynamometer of the Royal Society, brought by Mr. Amos, C.E., for the purpose of these trials, was very light for a double

plough, being only 4 cwts. 2 qrs. 7 lbs. The draught of Messrs. Howards' was also light in comparison to some of the others, being 5 cwts. 1 qr. 14 lbs. The furrow in each case being fully 5 inches deep by 9 inches wide—that is, 18 inches for the two furrows, and both the ploughs were on a very even sole. Here perhaps, for the sake of comparison, it would not be amiss to state the draught of a single-furrow plough, one by Messrs. Hornsby, which was tried on your ground by the dynamometer, it was 4 cwts. 2 qrs. 14 lbs., a trifle in excess of Messrs. Ransomes' draught of their double-furrow plough; but it must be stated that the depth of furrow in the case of the single plough was 5½ inches as against 5 inches in the double. This slight difference in draught may seem difficult to account for, but we think there can be but little doubt it is, in a great measure, owing to the system of suspension now employed by many of the double-plough makers, instead of the old sleading one. Had time allowed, it was our intention to have tested the difference between the two systems, and much we regret we could not do so. The double plough brought into the trial-field by Messrs. Ransome was an exceedingly strong and well-made implement, and worked most satisfactory. It is easily thrown in and out of work at the headlands by raising and lowering a central wheel with a lever, and this wheel also turns well and easily on the headlands. To Messrs. Ransomes' double-furrow plough we awarded the first prize. The Messrs. Howards' double-furrow plough, at the Alford meeting, was a most excellent implement; well-made in all its parts; the arrangements good, showing great strength and simplicity of construction, and readily put into and out of work. The steering by both the front wheels with the same lever makes the turning of the plough on the headlands a most easy process. The suspension is well balanced, and for the heavier kind of land this will prove a valuable kind of plough. The above two ploughs (Howards' and Ransomes') were easily and quickly adjusted to the desired depth and width of furrow, viz., 5 inches and 9 inches. To Messrs. Howards' plough we gave the second prize. Fowler's plough, which was exhibited by Mr. Harwood Mackinder, of Langton Grange, and who has regularly worked it on one of his farms for some time, is a thoroughly good and useful plough. At the trial it did some very good work—not equal in appearance to that of the two previously mentioned, but quite worthy of our notice, the furrows being well turned and packed, leaving the land in a very good form to produce a good seed-bed with but little labour. On the whole, this is a strong good double-furrow plough, easy to manage, and with Perkins' patent steerage (as was the case with the Fowler's plough exhibited at the Peterborough meeting) turning most readily and easily at the headland. Perkins' patent steerage was not attached to the Fowler's plough at Alford. The draught of Fowler's plough was 5 cwts. 2 qrs. 24 lbs. Cooke, of Lincoln, had a double-furrow plough on the ground; it did good-looking work to a casual observer,

the furrows being well cut and sharp; but they were not well turned over, the land consequently was left too hollow, and so would require more labour to produce that desirable object—a good seed-bed. This plough, by Mr. Amos' Table (to which we beg to refer), shows the lightest draught of any of the double ploughs tried; but it must be remembered that the depth of furrow was only 4½ inches, instead of 5 inches, the depth worked at by all the other ploughs. Had the weather and time allowed we should have given this plough another trial on the dynamometer, for it was thoroughly worthy of it, and received with Fowler's a high commendation from us. The Messrs. Ball, of Rothwell, near Kettering, exhibited a plough which did nice-looking and good work, cutting out the furrows with a sharp angle, and laying them well. The dynamometer, however, told its tale—making the draught 6 cwt. 1 qr. 14 lbs. The remaining three ploughs do not require special notice from us, we will therefore simply refer to the Tables as to draught given by Mr. Amos.

DRAUGHT OF DOUBLE-FURROW PLOUGHS.

Exhibitors.	Draught in Cwt. qr. lbs.			Remarks.

Fowler	5	2	24	
Howard.	5	1	14	
Ashley	8	1	14	
Ball	6	1	14	
Ransome ...	4	2	7	
Cook.	4	0	0	Only 4½, instead of 5 inches, the depth it should have been.
Hodson.	5	1	7	
Average...	5	3	7½	

We fear you will think our report a long one; but we cannot conclude it without congratulating the Committee of the Alford Agricultural Society on the success of their meeting, as regards double-furrow ploughs and ploughing. Not only does the immediate district but the country generally owe a debt of gratitude to these gentlemen for the trouble they have taken and the energy they have displayed in getting up and carrying out this trial; and they deserve special thanks also, for having procured the valuable assistance of C. E. Amos, Esq., C.E., without whose help the interesting and very necessary trials on the dynamometer could not have been carried out.

Thanking the Stewards for their kind attention to ourselves,
We are, Gentlemen, your obedient servants,
H. V. GRANTHAM,
JOHN HELMSLEY,
JAMES MARTIN.

November 30th, 1870.

WIDE DRILLING.

BY CUTHBERT W. JOHNSON, F.R.S.

The width at which seed corn should be drilled has long been a moot point with the agriculturist. When Jethro Tull so earnestly advocated the use of his drill, the width of the rows did not escape his attention. He well perceived that on many soils, the drill and the horse-hoe might both be profitably employed. To this end he used a much smaller amount of seed than was usual in his time, and he drilled at such widths as allowed of the free use of the horse-hoe. Tull was born, as it has been well remarked, before his time. He fell, however, into the error of many a man who had not his genius—his conclusions were often far too sweeping—as when he contended that by drilling the corn at wide intervals, good crops could be raised on any soil, with less seed, and without fallows, or dung. The many correct observations

he made, were however, very remarkable; he had a far greater knowledge of the effect of the atmosphere upon vegetation than was possessed by his contemporaries, who were wont to denounce his modes of cultivation, and ridicule his reasonings, with more acrimony than sense. For instance, in the third chapter of his Horse-hoeing Husbandry, he refers to the existence in the air of a substance which he regarded as “of the nature of aquafortis.” It is nearly a century and a-half since Jethro Tull made this remarkable observation, long before nitric acid was shown to exist in our atmosphere.

From the days of Tull (he died in 1740) the use of the drill made but slow progress until the beginning of the present century. Arthur Young was long opposed to it, but Lord Leicester rendered it popular by his successful use

of it at Holkham. I find, however, but slight attempts to employ wide intervals in drilling corn until the time of the Lois Weedon experiments, when the Rev. S. Smith on his heavy wheat soils adopted the system of growing wheat on the same land every year, by leaving a space equal to rather more than three feet between every three rows of drilled wheat, and so fallowing and cleansing that unoccupied space as long as the height of the growing corn would allow.

By this process only half the land was sown, but then, the soil was kept clean, and the atmosphere had more ready access, not only to the plants, but by stirring the land in the intervals to their roots also, and this last is, I take it, an advantage for certain soils and cereals, not so generally understood as is desirable.

Now, the cost and profit of the system thus employed at Lois Weedon is of primary importance, and this I will state in the words of the author of the "Word in Season," when he said: "I sum up, then, the average annual outlay for the wheat crops from first to last; always keeping in mind the digging process I have described—how it began with one shallow spit the two first years, increasing by degrees to two good spits of pulverised soil, two or three inches only of solid clay being added, and for four years not even that.

Digging and cleaning the moiety of each acre	...	£1	14	0
Horse-hoeing do. three times, 6s.; ploughing, 4s.	...	0	10	0
Hoeing and hand-weeding...	...	0	5	0
Rolling with crusher at seed time and at spring	1s.	0	3	0
Two pecks of seed 2s. 6d., dibbling 5s.	...	0	7	6
Bird keeping	...	0	4	0
Earthing up wheat...	...	0	3	0
Reaping, &c., to thrashing and marketing...	...	1	13	0
Rent £2, rates and taxes 4s. 3d.	...	2	4	3
Total outlay	...	£7	3	9

The produce and profit from Sherriff's red wheat on these half acres, Mr. Smith thus gave:

Thirty-four bushels of wheat at 5s.	...	£8	10	0
One and a-half tons of straw at 40s.	...	3	0	0
		£11	10	0
Deduct outlay	...	7	3	9
Net profit	...	£4	6	3

The experiments of Lois Weedon were repeated and elaborately examined at Rothamsted by Mr. J. B. Lawes and Dr. Gilbert in 1851, and the subsequent years, with very indifferent success (*Jour. Roy. Ag. Soc.*, vol. xvii., p. 582). These experiments were reviewed by Mr. Smith, and several sources of error pointed out (*ibid.*, vol. xviii., p. 30).

It was in 1865 that Mr. J. A. Clarke, of Long Sutton, reported the result of his trials upon the Lois Weedon system. The results which he obtained convinced him (*ibid.*, N.S., vol. i., p. 79) that "it is possible that hand-trenching by the spade to a depth of 18 or 20 inches would enable my field to produce good wheat crops in perpetuity; but as my horse-tillage extended only to a depth of 9 or 10 inches, and effected but a rough pulverization compared with that of the fork, I did not expect a long series of crops. My experiment simply proves that *several paying wheat crops can be grown, one after the other, without any manure, provided the land be in fair wheat-growing order at the beginning.*" After detailing the mode he adopted in the cultivation of wheat on the same land for a series of years, Mr. Clarke thus summed up the results of his experiments (*ibid.*, p. 85): "And now for the practical recommendation arising

out of this experience. Not necessarily to grow four or more wheat crops in yearly succession on the same land; for in my experiment you see a principle tried to an extremity, just for the sake of proving the productive power of intercultural tillage. Not to introduce a rotation like mine as a pattern to be followed on a large scale. Suppose we take but a couple of wheat crops together in a three-field course—that is, two years wheat, and the third year spring corn, green crops, or what you please, the straw being returned to the land as manure in this third year. On my field the produce on this system (as I have shown from what actually was raised on the comparatively exhausted ground) would be, with every degree of probability, 36 to 40 bushels per acre in an average season. Take a low market—say, at 36s. per qr. Then 36 bushels per acre give a return of £8 2s.; and deducting the low total cost of the crop, £5 10s., we have a balance of £2 12s. per acre for profit and interest of capital. A yield of 40 bushels an acre at the same price would give a surplus of £3 10s. per acre over the total expenditure. If you reckon upon the more reasonable market-price of 40s. per quarter, the yield of 36 bushels leaves a profit of £3 10s. per acre, and the yield of 40 bushels leaves a profit of £4 10s. per acre. On 300 acres arable we should have 200 acres under wheat, producing a nett annual income of £520, £700, or £900, according to whichever yield and market we met with. No manure being wanted by either year's wheat crop, all the wheat-straw, enriched if you please with cake and corn feeding, would go to manure the remaining 100 acres of crops—spring corn, green food, and roots; and if it is really more profitable to grow food for live stock than to sow large breadths of bread-corn under the common mode of management, there can be no doubt that this 100-acre portion (with 200 acres of straw manuring it) would account for itself without any heavy deficit of expenditure over proceeds. But this manuring is not all that would be in favour of the 100 acres of cropping. Not only is the second year's wheat crop produced at a total outlay of £5 10s. per acre, but *the land is simultaneously fallowed and cleaned in readiness for the third year's mixed cropping.* The stripe-wheat relieves the green crop of its old burdensome duty of cleaning the land for succeeding crops, and no part of the 100 acres will have to undergo the usual long processes of winter and spring fallowing. Hence the expenses on such a crop of roots would be far less heavy than in the common way."

It was in consequence of the report of Mr. Clarke's experiments, that in 1868 a series of very valuable trials on the width of the drills in corn-seeding were instituted by the Chamber of Agriculture at Cirencester. The results of these have recently been detailed by Professor Wrightson (*ibid.*, vol. vi., N. S., p. 299). The love of truth which marks the Professor's introduction to his Essay will not escape the reader's notice. If his caution in arriving at a conclusion had been more frequently regarded, many an agricultural self-deception would have been avoided. As he well remarks at the opening of his very valuable report: In conducting agricultural experiments, the investigator is beset with many difficulties which tend to render the results indistinct, and to detract from the value of his work. Among these difficulties may be named, inequalities in the condition, or the natural fertility of the soil; inequalities in the vigour of the plant; peculiarities of the season; and attacks of insects. A number of plots may be measured off, and treated with care, but as the crop advances towards maturity, one or other of the above named sources of error appears, causing differences, not attributable to methods of cultivation or special dressings of manure. Hence the

importance of repetition and control, for although a single series of experiments may yield results of comparatively small value, several series designed with a view to confirm or control each other will probably elicit evidence of almost irresistible strength. The Cirencester Chamber of Agriculture in undertaking the work of conducting field experiments kept the truth steadily in view, and it will be observed that the variety of methods of cultivation was restricted. The treatment decided upon was repeated sufficiently often to justify some useful conclusions being drawn, but in spite of the precautions taken contradictory results were occasionally obtained. Such disagreements are not un instructive. They teach the importance of each farmer conducting experiments upon his own land in order to find its peculiarities. When a general concurrence of evidence is obtained an important point is gained; when dissimilar answers are the result, some special reason for the want of conformity must be looked for in the soil and surrounding conditions.

It was in the autumn of 1868, that the Cirencester chamber decided to carry out a series of wheat experiments. In planning these it was resolved that the trials should be of a simple character. That the same series should be simultaneously carried on upon as many farms as possible. That duplicate plots should in every case be used. The Cirencester trials consisted of two series, one upon different methods of manuring wheat, and the other upon different modes of drilling and tillage. It is to this last series that I propose on this occasion to confine my attention.

The usual width of drilling wheat being about 9 inches, it was resolved—(1) to omit every alternate row, leaving a space of 18 inches between the rows (2); to omit two drills, and leave two, making a space of 27 inches between double rows 9 inches apart; (3) to omit two drills and leave two, forking the interspaces during the summer; (4) to attempt the cultivation of carrots or potatoes between wheat-rows arranged as just described; (5) to try the effect of firmly pressing land with the foot in winter and spring. In carrying out these experiments the wheat was in some cases sown with the drill in the usual manner, and the surplus rows were obliterated by the hand-hoe soon after the blades of corn appeared above ground. In other cases the drill was set so as to deposit the seed at the required width. The objects of these experiments were as follows: To show (1) how far a free admission of air and light influences the growth of the wheat-plant; (2) how far interculture is beneficial or the reverse; (3) the effect of thin seeding. Similar experiments upon barley were also undertaken with interesting results. The following is a list of the plots required for carrying out these trials:

- 2 plots in which 2 rows were alternately omitted and left.
- 2 „ in which 2 rows were alternately omitted and left, the interspaces being forked twice through the summer.
- 2 „ the same as the last, but with carrots or potatoes planted in the interspaces.
- 2 „ firmly pressed with the foot.
- 2 „ untouched for comparison.

Some encouraging results, obtained by Mr. J. A. Clarke from trials upon wide drilling (to which I have already referred) in a field cultivated upon modified Tullian principles, were published in vol. i., N. S., of the Royal Agricultural Society's *Journal*, and were the immediate cause of a series of wide-drilled plots upon the College Experimental Farm in 1865. A piece of winter-drilled wheat was selected, and alternate

rows were cut out with the hoe, leaving the wheat rows 18 inches apart. In like manner three rows were removed, and three left, forming triple rows with 10-inch interspaces. Of these plots some were forked, and others merely hand-hoed. As the experiment was only commenced on April 18th, the result, as might have been expected, was not favourable to wide intervals. It was, however, worthy of notice that although half the wheat was removed, the produce from the wide-spaced plots was, in spite of the unfavourable conditions of the experiment, equal to 27 bushels per acre, while the ordinary untouched wheat yielded 32 bushels per acre.

These experiments were repeated on a more extended scale in 1868, a season in which wide-drilling and forking could hardly be thought advantageous. Both wheat and barley were subjected to the trial, care being taken that the superfluous rows should be removed before they could interfere with the future prospects of the remaining rows. Some of the wide-spaced plots were twice forked during the summer, while others were kept free from weeds by means of the hand-hoe. The results are embodied in the following table:

TABLE I.—RESULTS OF WHEAT EXPERIMENTS, 1868.

	Bushels per Acre.	Weight per Bushel. lbs.
Alternate rows obliterated, spaces forked	29.6	65
Alternate rows obliterated, re- maining rows singled into tufts or bunches	22.8	62.5
Ordinary wheat for comparison	30.8	64.75
Three rows left and three hoed out, spaces forked	25.2	64
Alternate rows obliterated, spaces not forked	28.4	64
Alternate rows obliterated, re- maining rows "tufted" as in 2	24.4	64
Three rows left and three ob- literated, not forked	26.8	64.75
Alternate rows obliterated, spaces not forked	28.4	64.75
Three rows left and three hoed out, spaces forked	20.4	65
Ordinary wheat	29.2	65.5
Three rows left and three hoed out, spaces forked	23.2	65
Alternate rows obliterated, spaces forked	26	65

- Inspection of this table shows:
- 1st. That in no case was the crop so good as in the case of the wheat cultivated in the usual way.
 - 2nd. Plots in which the alternate wheat rows were obliterated were so nearly equal to those of ordinary wheat that, since half the seed might have been saved by sowing at once with a wide drill, the advantage is pretty equal in both methods.
 - 3rd. The forked wheat was generally worse than the corresponding unforked, a result borne out by the experiments of 1865.
 - 4th. Since 25 and 26 bushels per acre were obtained from *half the land* under crop in the cases of Plots 4 and 7, the question whether the interspaces would have borne as large a crop of wheat the succeeding year, as at Lois Weedon, is worthy of attention.

The experiments made upon barley during the same droughty season point to a clear advantage from wide-drilling and interculture, as will be seen upon inspecting Table II.

TABLE II.—BARLEY EXPERIMENTS ON THE ROYAL AGRICULTURAL COLLEGE EXPERIMENTAL FARM, 1868.

PLOTS (1.40 acre each).	Measure calculated at 58lbs. per Bushel.	Increase in Bushels per Acre over Average Unmanured. Ordinary.
	Bushels.	Bushels.
Ordinary	30.2	—
Alternate rows obliterated, May 3rd	38.0	6.4
Ordinary	35.5	—
Alternate rows obliterated, May 3rd	43.4	11.8
Alternate rows obliterated, spaces forked, May 3rd	40.7	9.1
Ordinary	29.0	—
Alternate rows obliterated, spaces forked, May 3rd	44.6	13.6
Average of three ordinary plots	31.6	—
Average results of two plots, alternate rows obliterated ...	40.7	9.7
Average result of two plots, alternate rows obliterated, spaces forked	42.7	11.1

The experiments upon wheat were repeated in 1869, at the farm of the College at Cirencester, and by Mr. Smith, of Bibury, the results of which will be found in the following tables :

TABLE IV.—TILLAGE AND WIDE DRILLING EXPERIMENTS ON WHEAT, 1869—ROYAL AGRICULTURAL COLLEGE EXPERIMENTAL FARM.

PLOTS (1.40 acre each).	GRAIN PER ACRE.	
	Weight per acre.	Increase or decrease.
	lbs.	lbs.
Two rows removed and two left	1440	— 80
Three rows removed and three left	1460	— 60
Firmly pressed with the foot ...	1040	— 470
One row removed and one left forked	1780	+ 260
Two rows removed and two left forked	1610	+ 90
Nothing	1360	— 160
" " " " " " " " " "	1330	— 190
Two drills 9 inches apart, alternated with 27-inch spaces (potatoes between) ...	1650	+ 130
Two drills omitted and two left, spaces forked twice	1060	— 460
Two drills omitted and two left, land pressed	1640	1520= average
Two drills taken and two left, and land pressed	1560	
Untouched plot	1360	

TABLE V.—WIDE DRILLING EXPERIMENTS ON WHEAT, 1869—BY MR. SMITH, OF BIBURY.

PLOTS (1.20 acre each).	Grain per acre.	Straw per acre.
	lbs.	lbs.
Two drills 9 inches apart, alternated with 27-inch spaces (potatoes between) ...	3200	4260
Two drills omitted and two left, spaces forked twice	3020	4140
Two drills omitted and two left, land pressed	3080	4340
Two drills taken and two left, and land pressed	3280	4380
Untouched plot	2760	3500

The results obtained by Mr. W. Smith, of Bibury, were so satisfactory that he has sown a larger area of wheat upon the same principle this season. Here the wheat was at once drilled the required width, thus actually

saving 1 bushel of seed per acre. The land was naturally good, and may be described as a quick free barley soil, dark in colour, and in excellent condition. The previous treatment of vetches fed, followed by turnips fed, was a good preparation for wheat. Table V. at once shows that a considerable, and in some cases remarkable, increase in yield was obtained by adopting the proposed plan of cultivation. A party of farming friends, who visited the experimental field, were greatly pleased with the wide-drilled portions, and considered that they would probably yield *as well as the plots manured with nitrate of soda*. The heads were exceedingly large and well filled, and the yield of both grain and straw fully attested the truth of these observations. In one case, where alternately two rows were omitted and two left, the interspaces *being firmly pressed*, there was an increase of 8½ bushels of grain and 880 lbs. of straw per acre! In the second plot, where the interspaces were planted with potatoes (and consequently, to some extent, worked between the rows) there was an increase of 440 lbs. of grain (above 7 bushels) and 760 lbs. of straw. In a third case, an increase of 320 lbs., or upwards of 5 bushels, of grain was obtained. And, lastly, where the spaces were twice forked, there was an increase of 260 lbs., or 4 bushels per acre. Such results indicate the importance of carrying out simultaneous experiments upon many farms if we desire to arrive at truth; they also teach the necessity of each farmer trying experiments upon his own land.

From the general results obtained from these valuable researches (and there are others reported by Mr. Wrightson) we may be well encouraged to repeat and vary these trials. There are many facts which lead us to the conclusion that we have yet much to learn in the drilling of our seed corn. The superior strength and finer ears of the plants growing on the verge of our corn fields, and those sown amongst vetches, or those accidentally dropped in places where they have abundance of room to vegetate—these, and other facts of a similar kind, all seem to give the same evidence as that afforded in the Cirencester experiments, of which we learn (*ibid*, p. 321) “where wheat is allowed abundance of room, the growing plant assumes a dark-green vigorous appearance very similar to that of wheat dressed with some highly nitrogenous manure; and this effect is not confined to any particular season, but may be seen wherever thin sown can be contrasted with thicker sown wheat.”

THE CENTRAL AND LOCAL CHAMBERS OF AGRICULTURE.

REFUSAL TO PAY ANY MORE SUBSCRIPTIONS.

At the General Meeting of the North of England Chamber of Agriculture, in reply to a member, Mr. ARKLE stated that the subscription to the Central Chamber of Agriculture had been paid for this year.

Mr. THOMAS LAWSON said they should withdraw the subscription if the Central Chamber continued to say they had power to represent the opinion of the Chamber without consulting the North of England Chamber. All steps for continuing their connection with the Central Chamber should be adjourned until they heard the result of the meeting in London.

Mr. ARMSTRONG, the Secretary, said that a letter had been received from the Central Chamber, requesting the Chamber to consider a resolution which had been passed at a meeting of the General Council, with respect to memorialising magistrates at the January Sessions on the subject of the rates levied by them; and also to present a petition on the subject to the House of Commons.

Mr. LAWSON said there had been no opportunity of giving notice to the members that such a matter would come before them, and it would be irregular for the Chamber to attend to it now.

The SECRETARY said the Sessions would be held before the next meeting of the Chamber.

Mr. LAWSON said he would propose that the consideration of the matter be adjourned until they had before them the resolutions passed at the meeting in London in relation to the connection between the provincial chambers and the Central Chamber.

Mr. CHARLTON, the Chairman, thought they were quite in

the dark as to what the Central Chamber would do in the matter.

Mr. LAWSON said the subscription should not be paid to the Central Chamber.

The SECRETARY said that that would come before the meeting of the Council in January.

The communication from the Central Chamber was laid upon the table.

THE CENTRAL AND THE LOCAL CHAMBERS OF AGRICULTURE.

It has for some time past been sufficiently evident that, while the local Chambers of Agriculture have been developing into really useful institutions, there has been as manifest a lack of administrative ability at head-quarters. We have never hesitated to draw the strongest possible line between the actual service of the country agent and the mere pretension of the central power. In fact, any decisive step ever taken in the provinces has been pretty generally frittered away in vapid discussions over round-about resolutions when once the question has been carried to London. Rarely, indeed, has any representative man had anything satisfactory to report when he reached home again. And the world at length is coming to see this, although for a season we were subjected to the most absurd abuse, because we declined to commit ourselves to the proceedings of a clearly incapable body. At the general meeting in the Smithfield show-week the chief business of the Central Chamber was a discussion as to how its own constitution might be amended, or in other words how it might be rendered a more efficient instrument. It is not our purpose here to dwell over this conference, because so far nothing has come of it, or, as one of the general members said on leaving the room, "Well, we have done nothing but talk." It may be interesting, however, if only on behalf of these very tributaries, to see what the local Chambers think of the centre-piece.

At the close of the meeting in Salisbury-square, Colonel Tomline terminated his duties as the Chairman for 1870, and early in the following week he was present at a dinner of the Suffolk Chamber at Ipswich, where a feeling anything but favourable to the Central Chamber was very noticeable. Lord Henniker "had heard many members of the Suffolk Chamber say they did not get much good out of the Central Chamber, and that their Chamber should not subscribe to it." Mr. W. Kersey "had been astonished at the number of amendments made upon amendments at the Central Chamber, and he was glad it was proposed to reduce the Committee of twenty-four to twelve." Mr. Herman Biddell said "what was wanted was a body that would speak with power and authority for the Agricultural interest;" and Mr. Corrance, M.P., seemed to fear that under any other circumstances "the talk would be interminable and the business nothing;" although this, in point of fact, is just what is complained of at present. Some time back a delegate from a Devonshire Chamber told his friends in the West how there was a member of Parliament at the Central Chamber who was always jumping up again "like a Jack-in-the-box" whenever anyone else sat down. Judiciously enough the President was not content with what Mr. Kersey, Mr. Biddell, Mr. Corrance, or Mr. Hawkins said, but "he would like to hear Colonel Tomline's opinion, he having greater knowledge of the Central Chamber;" and in answer to this invitation, Colonel Tomline did say he "was glad to see the impatience shown by some delegates that the Central Chamber had done little or nothing." Further, that the "Central

Chamber had practically no power. It was in the local Chambers, where he hoped it would always remain, and in the House of Commons;" while the gallant gentleman repeated with marked emphasis his opinion that "the Central Chamber had done nothing." It is true that he qualified this by adding that the Central Chamber had organized the establishment of the local Chambers, which it was not worthy to control. "Surely one small room in Salisbury Square was not so fit a place for those Chambers to exert their energies.—He had felt for some time that the Central Chamber was, after all, a sort of Convocation, with the semblance of power, without its reality," and so forth.

This is tolerably plain speaking, coming as it does with all authority from a Chairman of the very Society which he condemns; but this is not all. Mr. Lawson, of the North of England Chamber, has recently addressed two or three strong letters to the secretary of the Central Chamber on this very subject, in one of which he says: "You and I are not on one platform as to whether the Central Chamber does on all or any question represent the opinions of provincial Chambers. We will probably be as far asunder as to why no member from here will attend the Central meeting on the 7th of December. When the North of England Chamber delegates one of its members to the Central he bears with him the resolutions of his Chamber, and his action is limited within the spirit of the resolutions, and the member delegated is chosen as well acquainted with the subject, and whose opinions are in harmony with the resolutions." And further: "Such a Council—with independent action—would be less of an association of Chambers than of a small agricultural Parliament, and the effect of such independent action would not fail to sap the vitality and energy of provincial Chambers; the extinguishment of local control would paralyse local action. The common sense of agriculturists would naturally ask the question, What degree of power or usefulness does such a Central Council possess beyond our ordinary real parliamentary representation?" Colonel Tomline and Mr. Lawson certainly look to agree very well as to the mere pretensions and actual uses of the Central Chamber of Agriculture; and at the last meeting of the North of England Chamber the members declined to entertain any communication from or pay any subscriptions to the Central Chamber for the present. As the Chairman said, "they were quite in the dark as to what the Central Chamber would do." Then, again, at the last Monthly Meeting of the Morpeth Chamber the following reply was ordered to be given to a letter from the Local Taxation committee soliciting a subscription: "The objects of the Local Taxation Committee appear to be similar to the objects of the Morpeth Chamber of Agriculture, and this Chamber cannot see that the grounds on which such Committee applies for contributions from the Morpeth Chamber could not be at least as fully urged by this Chamber on the Local Taxation Committee. In declining to contribute to the expenses of the Local Taxation Committee, this Chamber begs to express its cordial

sympathy with every person or institution (under whatever name) that is earnestly endeavouring to effect an improvement in our local taxation." This is very politely put, but at the same time the application appears to be regarded as something of an impertinence. If the Morpeth Chamber has anything to urge as to local taxation, of course it can put its case into the hands of its own town and county members, without paying to put it under the charge of any particular gentleman selected by the Central Chamber of Agriculture.

But this is a habit with the Central Chamber, which is always pleading poverty and always sending round the hat, as we hear a subscription list under its auspices is now being put about London. And yet the Chamber can afford to treat its own Council, that is itself, with the most charming liberality. There are other central agricultural associations, like the Royal, the Smithfield Club, the Farmers' Club, and the Royal Agricultural Benevolent Institution, where the members of Council and Committee feel it something of an honour and a distinction to be called up to act to the best of their ability on behalf of themselves and their fellows. But not so the twenty-four members of the Council of the Central Chamber of Agriculture, where, to "ensure an attendance," as the phrase goes, a second-class fare for each man must be paid there and back. Put in the secretary, and say twenty-five people for eight meetings a year at so much a visit, and what does it come to? To carry the thing handsomely out, surely they should also be boarded and lodged, if not perhaps in the one small room in Salisbury-square, of which Colonel Tomline speaks. But unfortunately the Central Chamber has no room, no office whatever in Salisbury-square. This great centre of communication has

actually no resting place of its own, but is pushed from pillar to post just as it may suit the Hotel to give the occasional use of a room here or there, now or then. The Council in its last report plaintively "regrets the necessity for keeping down the printing account has compelled them to confine within narrow limits the issue of printed matter on very important subjects," and yet the Council, as we shall assume, continues to draw the second-class fare. Well may Mr. Kersey be glad that it is proposed to reduce the Council from twenty-four to twelve, the advantage of which in a commercial point of view is as clear as £ s. d. can count it. But it is proposed to go even beyond this, and to cut off the supply of second-class tickets altogether. We have before now suggested the decency of such a step, but in this article it must be understood that any criticism on the proposed amendment of the Central Chamber does not now proceed from *The Mark Lane Express*, but either from its own body or the local Societies. Two of these authorities are past chairmen—Colonel Tomline, who says that the Central Chamber has done nothing, and Mr. Sewell Read, who recommends that the travelling expenses of the members of Council should no longer be paid. If we did go a step further, we should say that the future Council, however composed, would best consult its dignity by not descending to puff off in its official reports any particular "jobs" in which any of the Council or its people may be known to have an interest. Only imagine a Society which aims at a national importance being brought to such a use by the guardians of its own honour! No wonder that the country cries out for reform, or rather for thoroughly new construction.

THE CENTRAL CHAMBER OF AGRICULTURE.

A meeting of the Council, comprising deputed members from provincial chambers and elected members of Council, was held on Wednesday, December 7, at the Salisbury Hotel. Colonel Tomline, M.P., the president for the current year, occupied the chair at this and also at the annual meeting of the subscription members which followed.

The TREASURER reported that during the past half-year there had been received in subscriptions and donations the sum of £459 15s., and that the balance in hand on last account was £171 13s. 4d., together £631 8s. 4d. From this was to be deducted, for salaries, printing, and expenses of general management £505 8s. 2d., which left a balance to the good of £126 0s. 2d.; add to this for arrears of subscriptions £65 and the assets to the credit of the Chamber would come to £191 0s. 2d. This statement was not quite so favourable as that for the last-half year; but £50 had been subscribed to the funds of the Local Taxation Committee.

Eleven additional members were then elected to the Chamber.

The CHAIRMAN of the Local Taxation Committee, Sir M. Lopes, M.P., then submitted the monthly report of the committee as follows:

The Local Taxation Committee, in presenting their monthly report to the Council of the Central Chamber of Agriculture, have much pleasure in stating that, in accordance with a resolution passed at their last general meeting, they have commenced the issue of a monthly publication, giving various items of information on the subject of local taxation. Of this 4,000 copies have been gratuitously circulated over the country, chiefly amongst clerks of the peace (who have been requested to bring the same to the notice of justices), amongst the members of the committees, the local honorary secretaries, subscribers, and others who are friendly to the object the committee have in view. Agreeably to the desire expressed at the last general meeting of the Council, your committee have also drawn up a form of petition to the House of Commons, which will be submitted for approval to magistrates assembled at Quarter Sessions.

The committee do not venture to put it forward as a model for every county, but express a hope that Courts of Quarter Sessions in each county will alter and amend it to suit their own views or respective requirements. The committee would observe that the petition as it now stands has been approved by a committee of the Court of Quarter Sessions of Devonshire, appointed for that purpose, and will be submitted for adoption at the next General Quarter Sessions.

To the Honourable the Commons, &c.—The Humble Petition of the Justices at Quarter Sessions assembled for the county of Devon

HUMBLY SHOWETH,—That the rates collected under the authority of this Court for county purposes form a heavy and annually increasing charge on real property (viz., lands and houses), in addition to the general taxes for imperial purposes which it bears in common with all property. That these charges are for the most part in support of such objects as police, buildings for militia stores, lunatic asylums, and the maintenance of those lunatics whose settlement cannot be ascertained, coroners, prisons, and other matters connected with the administration of justice, &c., &c., all of which purposes are essentially of national import, and are maintained for the security of the life of all persons equally, and for the protection of every description of property. That only an average of little more than 20 per cent. of the amount of the rates so collected under the authority of this court is, as respects its expenditure, in any way under its control, while nearly 80 per cent. is expended under statute, and is, therefore, under the control of the imperial Government. These facts appear from a return printed by order of your honourable House on the 21st of April, 1869, where the total amount of county rate spent under statute was £1,589,910, whilst the amount spent under control of the Justices was only £359,451. It further appears, from a return made to the House of Commons in the year 1867, that in Devonshire the whole of the county expenditure for

that year was £39,000; the amount of this which was statutory, and over which the magistrates had no control, was £33,000, and the amount under the independent jurisdiction of the magistrates was only £6,000, and that included salaries, bridges, highways, and other miscellaneous payments. (Each county would here insert similar statistics.) The Court cannot help further remarking that whilst remission of Imperial taxation has been annually made for the benefit of the whole nation, very many newly-imposed burdens have been laid chiefly, if not wholly, upon house and land property. That in justice to the ratepayers, and having regard to this absence of local control, this Court prays your Honourable House to take into your early consideration whether it be not expedient to defray from the Imperial Exchequer the expense of the whole, or a larger portion of such objects as those to which these rates above enumerated are devoted. And your petitioners, &c. A form of memorial has also been drawn up at the request of several provincial Chambers of Agriculture which the committee recommend for their use, and that of ratepayers generally, when appealing to Courts of Quarter Sessions to petition the House of Commons. The form of memorial as approved by your committee is as follows:

To the Justices in Quarter Sessions assembled for the County of ———. The Humble Memorial of the Ratepayers of the said County, being Members of the Chamber of Agriculture.

The undersigned ratepayers, owners, and occupiers of land and houses in the County of ———, feeling strongly the urgent necessity of some revision and readjustment of the present mode of assessment, and of inducing the Government to contribute more largely towards those rates which are levied under the authority of Courts of Quarter Sessions, would respectfully beg to call the attention of your Honourable Court to the extreme importance of this subject, and would express a hope that the Court, as the rating authority, will, on behalf of the ratepayers, petition Parliament to take this question into their early consideration. Your memorialists would observe that these burdens have of late years been vastly increased by rates for new objects, such as police, buildings for militia stores, lunatic asylums, &c., &c., which objects, they contend, are for the common weal, rather than for the benefit of one particular class of the community. In conclusion, your committee feel that their present difficulty is how to reach the Board of Guardians, and the smaller ratepayers, more particularly those interested as owners or occupiers of houses in towns. During the present month the committee will make every effort to influence public opinion among this section of the ratepayers, and they hope to induce Boards of Guardians to petition Parliament early in the Session to take into consideration the whole of this important subject. Since the last monthly report the committee have received some further subscriptions amounting to nearly £60. There was one observation which he should like to make respecting a subject that was not alluded to in the Report. It was to give them a reminder with reference to the Elementary Education Rate recently imposed: that unless, where a parish desired to erect school-buildings, an application was made to the Privy Council before the 31st of December, the opportunity would be lost of obtaining a Government grant for that purpose. It would not be necessary, however, to send in estimates, specifications, and plans. All they would have to do, in the first place, was to write to the Privy Council Office for an application-paper, which they would then fill up, and return, accompanied by a rough plan of the proposed school-site. It was said by some that the building of schools was unnecessary, unless the children could be compelled to attend them. That, they thought, was a defect in the voluntary system; but he begged to state that, under that very voluntary system, it was quite within the power of the managers to appoint a Board simply for the purpose of making the attendance compulsory and regular, if they considered it expedient to do so. The same powers were found, therefore, under both the voluntary and the compulsory system. In conclusion, he moved the adoption of the Report.

A MEMBER asked whether the adoption of compulsion would not be subject to the approval of the Education Board? That was how he himself read the Act.

Sir M. LOPES believed not.

The motion was seconded by Sir G. JENKINSON.

Before putting the question, the PRESIDENT remarked upon the fallacy which sometimes lay hidden in the use of words,

and the wisdom of looking beneath and through them. It had been said that eighty per cent. of the local rates were imperative. Well, an imperative rate was a tax; and the matter would not bear a moment's consideration if these imposts were called a tax.

The motion was agreed to.

Mr. T. DUCKHAM mentioned that he had received some promises of subscriptions.

Mr. H. G. ANDREWS wished to be informed, what had been the effect of distributing the forms of petition amongst the members of the provincial chambers?

The SECRETARY replied that they were not returned to him, but when signed were transmitted to Members of Parliament for presentation.

Mr. ANDREWS would like to have some evidence that they had really been signed and forwarded to Members for that purpose. His own experience was this. In his county, where a complete organization existed, he had sent only 550 copies of the petition and memorial to as many parishes; and now at the end of some months he had only 40 signed and returned. He thought, therefore, that it would be a simple waste of money to send out any more of these printed forms of petition. The fact was that the feeling prevailed very extensively that the House of Commons took very little notice of petitions; and his own impression was that, if County Members in that House were unfavourable to the objects of the Chamber, they should be turned out at the next election (cheers and laughter). Nay, more, he should like to see the boroughs doing the same (renewed cheers).

A communication on the subject of local taxation, received from the Shropshire Chamber, was ordered to be acknowledged; as was also a letter from Professor Leone Levi, requesting that a meeting of the joint committee of the Chamber and the International Decimal Association on weights and measures might be arranged with a view to bringing the question under the consideration of Parliament early in the ensuing session.

On the motion of Sir M. LOPES, seconded by Mr. T. WILSON, the committee was then re-appointed, with a special instruction, moved by Mr. C. S. READ, that it should take no action until the meeting of the Chamber in February.

The Treasurer and Secretary were re-appointed.

The annual report of the Council prepared by the business committee was then laid upon the table. It is as follows:

In presenting their fifth annual report, the Council would call attention to the continued progress of the Chamber of Agriculture both in number and in organisation. Three influential Chambers, namely, those of Cambridgeshire and the Isle of Ely, Nottinghamshire, and Wisbech district, have been added to the list during the past year; and several chambers have increased their subscription to the funds of the Council, or, the Worcestershire Chamber from £10 to £15, the Warwickshire Chamber from £5 to £8, and again from £8 to £15, the Dorsetshire Chamber from £3 to £5, while the West Riding Chamber forwarded a donation of £5 in addition to its annual subscription. The Wigton Farmers' Club, deeming itself too remote from the place of meeting in London, has withdrawn. By the schedule appended to this report it appears that there are now two chambers subscribing £15 each to the funds of the Council, three chambers subscribing £10 each, one chamber subscribing £9, two chambers subscribing £7 each, twenty-eight Chambers subscribing £5 each, and seventeen chambers subscribing £3 each. Fifty-three Chambers contributing to the funds of the Central Council, and one Chamber, namely, the Scottish, being in corresponding association without subscribing, constitute the fifty-four Chambers which are entitled to representation in the Council by means of deputed members; and one Chamber, namely, the East Worcestershire, subscribers without being entitled to send up a deputed member—making a total of fifty-five Chambers. But considerable development has been given to the system of Branch Chambers; it being found that, where a large society of, say, six hundred or seven hundred or more members holds its periodical meetings only in the county town, or occasionally in other principal market towns of the county, but a small proportion of the whole body of members can possibly be present, and the resolutions passed by a meeting of perhaps one-tenth of the members composing the Chamber go forth as the decisions of that Chamber. Hence the extension which is being given to the system of Branch Chambers, in

which either the members are considered as members of the County Chamber, or else appear by representatives at the meetings of the County Chamber. The Devonshire Chamber has four branches in association, namely, at Barnstaple, Bideford, Colyton, and Honiton; the North of England Chamber has organized branches for the thirteen Poor-law Unions of Alwicks, Belford, Bellington, Berwick, Castle Ward, Gateshead, Glendale, Hexham, Lanchester, Morpeth, Rothbury, and Tynemouth; the Shropshire Chamber has eight branches, at Ellesmere, Ludlow, Much Wenlock, Newport, Oswestry, Shifnal, Wellington, and Wem; the Warwickshire Chamber has two branches at Henley-in-Arden and at Shipston-on-Stour; and the North Riding of Yorkshire Chamber has nine branches for Bedale, Malton, Pickering, Ripon, Ryedale, Scarborough, Thirsk, Whitby, and York. Including the thirty-six branches, there are now ninety-one Chambers of Agriculture, either directly or indirectly affiliated with the Central Chamber in London; and, from the returns (not complete) received from the various secretaries, this great organisation embraces a total constituency of probably more than 17,000 members.

The united yearly contribution of the fifty-four subscribing Chambers amounts to £275, entitling them to representation in the Central Council by one hundred and eleven deputed members, the average payment being about £2 9s. per member. The proportion contributed to the funds of the Council by the subscription members of the Central Chamber is as follows:—There are now on the books 155 annual members, and ten life members; and as three life compositions have been received during last year, the present rate of yearly income from subscription members amounts to £185. The subscription members are represented in the Council by twenty-six elected members, who are allowed to claim second-class railway fares for attending meetings; the outlay incurred during the past year for this railway provision for a certain attendance of members to transact business has amounted to £112; and deducting this sum from the whole contribution of the subscription members, namely, £185, it appears that the subscription members of the Central Chamber bring to the funds at the disposal of the Council a clear sum of £73, which is virtually a payment for the twenty-six elected members of the Council, averaging about £2 17s. per member.

The income of the Council has been considerably increased since last year, but the expenditure has been much greater, partly owing to a grant of £50 to the special fund of the Local Taxation Committee. The established charges, including the salary of the Secretary, exceed those of last year by only about £27; the printing, stationery, and postage account is about £15 less; and the expenditure for Parliamentary Papers supplied to the provincial Chambers and to the Central Chamber office remains about the same as the corresponding item last year. Partly arising from the earlier date for closing the books, the arrears of subscription are fully as heavy as they were at the end of 1869, three provincial Chambers being in arrears with their subscriptions for 1870, and one of them also for 1869; while of subscription members of the Central Chamber, forty are in arrear for 1870, sixteen of these being in arrear also for 1869, and five for 1868. The Council would impress upon such Chambers and members the importance of a prompt payment of their subscriptions, which are due in advance on the 1st of January for each year.

The Council regret that the necessity for keeping down the printing account has compelled them to confine within narrow limits the issue of printed matter on the very important subjects which have been discussed. They tender their thanks to the agricultural newspapers for full reporting, and to the press generally for giving publicity to the proceedings of the Council.

Of the fifty-four Chambers entitled to send deputed members to the Council thirty-nine have been thus represented during the past year. Of the eight meetings held from December, 1869, to November, 1870, the Warwickshire and Worcestershire Chambers have attended all; the Peterborough Chamber has attended seven; the Essex, Lincolnshire, Norfolk, Shropshire, and East Suffolk Chambers have attended six; the Hertfordshire, West Kent, Leicestershire, Monmouthshire, and West Suffolk Chambers have attended five; the Cambridgeshire, Hampshire, Northamptonshire, Nottinghamshire, Somersetshire, and Wisbeach Chambers have attended four; the Banbury, Herefordshire, East Kent, Newbury, Swindon, and West Riding of Yorkshire Chambers have attended three; the

Cheshire, Cirencester, Gloucestershire, Hungerford, Loughborough, North of England, Dorsetshire, and North Riding of Yorkshire Chambers have attended two; and the North Cheshire, Croydon, Goole and Marshland, Scottish, Staffordshire, and East Riding of Yorkshire Chambers have attended one. At every meeting a large majority of the Council has consisted of deputed members from provincial Chambers, and this fact is very gratifying to the originators and early supporters of the Central Chamber of Agriculture, whose desire was to establish a nucleus, around which might be gathered a body properly representative of a large number of independent societies, expressing the views and feelings of the whole agricultural community. The Business Committee, consisting of the twenty-six elected members of the Council, and always inviting the co-operation of any deputed members from provincial Chambers, whose presence has been from time to time available, have exerted themselves to arrange details of proceedings for the Council, and have greatly facilitated the orderly progress of debate, by drawing up concise resolutions in accordance with the general tenour of resolutions received from the provincial Chambers, and this without exercising any executive power whatever. Communications from provincial Chambers have, in all cases, been dealt with by the whole Council, the Business Committee possessing neither authority nor responsibility in connection with any decision or transaction of the Central Council. And, as far as practicable, care has been taken that the Chambers should have notice of the day of meeting and subjects for consideration several months beforehand.

LOCAL TAXATION.—On February 8th the Council voted a donation of £50 to the Local Taxation Committee, which was appointed by the Council in May, 1869; the proceedings of the committee have been reported at each of the monthly meetings of the Council; its report is appended to the present report of the Council, and the Chamber may be congratulated upon the success of that committee in raising a handsome special fund, in circulating a prize essay that has been found unanswerable, in disseminating printed matter, in organising public meetings, in moving parochial and municipal bodies to take action against the inequalities of rural taxation, in prompting a wide-spread discussion of the county rate grievance by magistrates in quarter sessions, and is largely influencing the course taken upon local taxation questions in the House of Commons. On May 3rd the Council unanimously reiterated the protest against the unjust exemption from contribution to the rates of income arising from personal property, declaring that the order in which the Government had indicated its intention of considering the local taxation questions was irregular and inexpedient, that no readjustment of the existing system will be acceptable unless preceded by an inquiry determining what objects now locally provided for are of local, and what of national obligation, and that the mere extension of assessment to woods, metallic mines, and Government property, and a division of rates between owners and occupiers could not be accepted as a settlement of the grievance complained of. Copies of the resolutions were forwarded to the President of the Poor Law Board. Public meetings were held at Taunton in the week of the Bath and West of England Society's Show, and at Oxford in the week of the Royal Agricultural Society's Show, both under the presidency of Sir Massey Lopes, Bart., M.P., chairman of the Local Taxation Committee.

ELEMENTARY EDUCATION.—On March 8 the Council unanimously resolved that the Government Elementary Education Bill merited the support of the Chambers, but declared against compulsory attendance of children up to the age of twelve years as a great hardship to the labouring classes, and in favour of regular attendance up to the age of ten years, supplemented by partial attendance after that age. The Council also resolved that the proposed education rate was an increase of an injustice upon owners and occupiers of rateable property, and that national education ought to be paid for out of the national taxation, at least until there has been a complete revision of the present system of rating. On April 5 the Council resolved that compulsory attendance ought to be required after ten years of age, nor after a certificate of proficiency in reading and elementary writing, at any age; and on May 31 the Council resolved that the limit of distance determining the exemption of a child from liability to attend school should be two miles instead of one.

TURNPIKE ROADS AND HIGHWAYS.—On February 8 the Council had before them resolutions embodying the views of the great majority of the Chambers of Agriculture on the Turnpike Trust question, to the effect that all remaining Turnpike Trusts ought to be abolished simultaneously; that the maintenance of all public roads should be settled upon a permanent and equitable system; that it would be unjust to charge the remaining debts upon rateable property only, and that those debts ought to be liquidated by the national exchequer, and that either the road expenditure ought to be partly defrayed out of the imperial revenue, or the rating system should be so revised as to bring under equitable contribution the general wealth of the district through which the roads pass. But after listening to an explanation from Mr. Knatchbull-Hugessen, M.P., Under Secretary of State for the Home Department, the Council unanimously resolved that it would be inexpedient to recommend any substitute for the toll system which might lead to increase local burdens, until the Government had announced their promised scheme for dealing comprehensively with the whole subject.

AGRICULTURAL STATISTICS.—On February 8th the Council considered a resolution to the effect that the agricultural returns as at present collected, are unreliable and unsatisfactory; that they should be made once in ten years, and be then compulsory. A proposition was also made that the returns should be quinquennial. Neither of these motions obtained a majority of votes; and the original resolution was discharged by the chairman. But an amendment declaring that agricultural returns should be annual and compulsory was lost by a considerable majority.

MALT-TAX.—On March 8th, at a Council attended by deputed members from thirty-two chambers, a deputation was appointed to lay before the Chancellor of the Exchequer a memorial praying for unrestricted liberty to sprout and prepare grain for feeding purposes, and praying for a repeal or reduction of the malt-tax, or for a transference of the tax from malt to beer by brewers' licences or otherwise. The deputation, which had an interview with Mr. Lowe on the same day, was supported by fifty-seven members of Parliament, and a very large number of agriculturists from the different chambers; the presentation of the memorial was followed by addresses from Mr. Rowley (of the Cheshire Chamber), Mr. G. A. Way (of the Staffordshire Chamber), Mr. Scaman and Mr. J. S. Gardiner (of the Essex Chamber), Mr. J. Whitwell (of the Peterborough Chamber), Mr. Manfred Biddell (of the East Suffolk Chamber), Mr. R. Leaman (of the Norfolk Chamber), Mr. R. Jasper More (of the Shropshire Chamber), and Mr. C. H. Luttimore (of the Hertfordshire Chamber). The Chancellor of the Exchequer admitted that the malt-tax interferes very much with the cultivation of the land and with the business of those who are engaged in husbandry; he declared that he should be very glad to reduce the tax if in his power to do so, and that if he could find any means of putting the duty upon a late stage of the manufacture upon beer instead of malt, nothing would give him greater satisfaction than to propose it.

REPORTS APPEARED IN THE LONDON AND PROVINCIAL PAPERS.—A very large number of copies of the memorial, the addresses, and the reply of the Chancellor of the Exchequer was circulated through the agency of the Chambers of Agriculture and otherwise.

UNIFORMITY OF WEIGHTS AND MEASURES.—On March 5th the Council entertained an application from Professor Leon Levi, of the international Decimal Association, for co-operation in obtaining a parliamentary inquiry into the best remedy for existing anomalies and disadvantages in our practice of weighing and measuring; and on April 5th the Council unanimously agreed to a petition praying for such select committee of inquiry. On May 3rd the Council appointed a deputation to attend a conference on the subject, at the Society of Arts on May 6th. On May 31st the Chairman (Colonel Tomline, M.P.), Mr. C. T. Head, Mr. Albert Pell, M.P., Mr. R. Jasper More, Mr. R. Varden, and the secretary (Mr. John Algernon Clarke), was appointed by the Council to act as members of a joint committee of the Central Council and the International Decimal Association, the latter being Earl Fortescue, W. J. B. Smith, M.P., Mr. James Yates, F.R.S., Mr. T. L. D'Eyncourt, Dr. Voelcker, and professor Leon Levi. This Committee drew up a report necessitating certain adaptations of our weights to the metric standards, recommending

that grain should be sold by "quintal" of 100 kilograms (or about 220 lb.), and that the kilogram, with its divided multiples and divisions, should be established as the sole standard unit of weight. Copies of this report have been transmitted to the Chambers of Agriculture, the Chambers of Commerce, Farmers' Clubs, and Municipal Councils; and on Oct. 4th the Council referred to the report to the provincial Chambers, requesting them to consider and resolve upon it prior to the Council meeting of February, 1871.

DISCOURAGEMENT OF THE APPLICATION OF CAPITAL TO AGRICULTURE.—On April 5th the Council unanimously resolved that the application of capital to agriculture is discouraged by (1) the undue amount of local taxation upon capital invested in land and its improvement; (2) uncertainty of tenure and the absence of compensation for unexhausted improvements; (3) unnecessary restrictions upon courses of cropping; (4) the over-preservation of ground game.

GUN-TAX.—On May 5th the Council unanimously agreed to a petition praying that the duty on game certificates might be retained; and that the exemption from the gun-tax of firearms kept within a house might be extended to those used upon the land and premises in the occupation of the owners of such guns.

GAME-LAWS.—On May 31st the Council unanimously passed a resolution declaring that an excessive preservation of ground game is incompatible with good farming, but disapproving of any legislation that would interfere with freedom of contract between owners and occupiers. The Council unanimously resolved that, in justice to ratepayers, all land should be rated at its full value, irrespective of any reservation of the rights of sporting on the part of the owner. The Council also passed a resolution to the effect that hares and rabbits ought to be excluded from the operation of the game-laws; but that such exclusion would render imperatively necessary a change in the law of trespass by giving a summary remedy without the necessity of proving pecuniary damage.

CATTLE IMPORTATION AND THE HOME CATTLE TRADE.—On November 8th the Central Council unanimously resolved that the thanks of the Council are due to the Right Hon. W. E. Forster, M.P., for the prompt manner in which the powers of the Contagious Diseases (Animals) Act were put in force upon the outbreak of cattle-plague on the Continent; but that the interests of both producers and consumers deemed that effective regulations for waterside slaughter should be permanently extended to all imported fat animals with guarantee for store stock. The Council also expressed their hope that the Government would firmly carry out the provisions of the Contagious Diseases (Animals) Act with reference to the establishment of a permanent metropolitan foreign cattle market, and that when such market has been opened the present restrictions against the removal of cattle from the metropolitan area will be rescinded.

RAILWAY CARRIAGE OF DEAD MEAT.—On November 8th the Council, by a resolution passed unanimously, called attention to the exorbitant charges of the railway companies for the conveyance of dead meat, and besought the railway companies, by a reasonable reduction of their tariff, to facilitate the supply of meat to populous districts.

INSURANCE OF FARMING STOCK.—On November 8th the Council unanimously resolved that the average clause, as insisted upon in the new regulations of the principal fire insurance companies, is inapplicable to a property so variable in amount and value as agricultural produce. The secretary was instructed to apply to the non-associated offices for statements of the terms upon which they effected insurances, and a committee consisting of Colonel Tomline, M.P., Mr. C. S. Read, M.P., Mr. Arthur Pell, M.P., Mr. Cornelius Wilfour, Captain Catling (of the Wisbeach Chamber), Mr. Jabez Turner (of the Peterborough Chamber), Mr. W. H. Morrison (of the West Riding of Yorkshire Chamber), Mr. W. K. Varden (of the Worcestershire Chamber), with the Secretary of the Central Chamber, was appointed to confer with the various insurance offices as to the most equitable mode of insuring farming stock, and to report thereon to the Council. The Licence Duty upon Farmers' Horses, and the abolition of the Hawkers' Licence, also engaged the attention of the Council.

RELATIONS OF THE CENTRAL AND PROVINCIAL CHAMBERS.—On October 4th the Council took into consideration resolutions forwarded from several provincial chambers making proposal for securing more united action between the

Central and provincial bodies, and the discussion was adjourned to the December meeting.

Mr. H. G. ANDREWS urged the importance of taking steps to make the proceedings of the Chamber more generally known to the public, and suggested that, with this object in view, a condensed report of them should be prepared by the Secretary, and sent to all the London newspapers, and to as many local ones as might be thought desirable. This plan was adopted both by the Royal Agricultural Society and the Bath and West of England Society, and would involve a very small expense. He contended that the principal channel through which they must work in order to influence public opinion was the press (Hear, hear). At present many of the London daily papers took not the slightest notice of their monthly meetings, whilst they reported all the meetings of Chambers of Commerce; and his own opinion was that Chambers of Agriculture occupied quite as important a position as they did.

Mr. NIELD differed from Mr. Andrews to the extent of thinking that the Chamber was greatly indebted to the press, and that it would be a mistake to send to the papers stereotyped and official communications from the Secretary (Hear, hear).

Mr. C. S. READ observed that reporters were not admitted to the Council meetings of the Royal Agricultural Society, and (pointing to the number of reporters seated at the table), said that such an array was in itself a sufficient proof of the interest taken by the London press in the proceedings of the Chamber.

Mr. YOUNGMAN: If the agricultural press were not in harmony with the Chamber the reason was easily explained; and he believed that so long as the Chamber maintained a paid organ they might expect to encounter opposition from a certain class of agricultural journals (Hear, hear).

The Council next proceeded to select the subjects for consideration and discussion at the meeting in February.

Mr. SMYTH suggested that the malt-tax was a question which the Council might with propriety deal with once more, if only to keep the Chancellor of the Exchequer in mind of the admission he had made as to its injustice (Hear, hear).

The PRESIDENT thought that discussion on the tax had long been exhausted, and that "action" was what they wanted now (cheers). The sphere for that was the House of Commons, where the county members were as much their delegates constitutionally as the members of the Council were in the Central Chamber of Agriculture (cheers).

A MEMBER remarked that the matter must not be left entirely to county members, who would not be strong enough to deal with it unless they were backed up and urged forward by the constituencies (Hear, hear).

Ultimately the subjects chosen for February were, "The Steps to be taken with regard to the Repeal of the Malt-tax," "Weights and Measures," and "Highways and Occupation Roads."

Mr. C. S. READ, M.P., said that, as one of the original members who had taken a prominent part in the formation of the Chamber, he had placed on the business paper a notice that he would call attention to its constitution. This he had done, not with the idea that any great changes or reforms were necessary, but for the purpose of eliciting from the various district Chambers what were their wishes on the subject (Hear, hear). Although a great number of those Chambers had expressed themselves favourable to some alterations, however, they were not at present agreed as to what the amendments should be; but one thing he gathered was that they imagined the Central Chamber possessed too much power. Now, according to the rules, the Central Chamber elected from amongst its own members 24 members of Council, together with a President and Vice-President, in all 26; and the district chambers had the power of electing, and he believed did elect not less than 111 members of Council, the whole of whom came to the Central Chamber, took part in its deliberations, and had a right to vote exactly in the same way as the other members of the Council. Consequently, the district chambers enjoyed a preponderance of four to one; and at the meetings of the Council he had always seen twice as many members from district chambers as there were of the central body. [Mr. NIELD: "Three to one."] No doubt. Two to one was certainly under the mark (Hear, hear). Now, what the Chamber chiefly wanted to enable it to carry on its

operations was the "sinews of war"; and in order to procure them the members of the district chambers must have some privileges conceded to them. But what inducement was there for any man to become a member of the Central Chamber, except the privilege of coming there once a year and electing the members of council at the annual meeting? That was all the privilege the subscription member enjoyed; yet that was a privilege which it was desired in some quarters to curtail. Let it be remembered that the business committee was elected by the general Council as a whole, and not by the 24 members of the Central Chamber Council. Last year they elected these 24 members of Council as the business committee, with power to add to their number, and that committee subsequently gave a general invitation to all members who were deputed by the district chambers to come and assist them at their deliberations in framing the resolutions to be submitted at the general council meeting on the following day. What had happened? If any gentleman would go and spend two or three hours night after night in preparing these resolutions, he would see that the Central Chamber, so far from having too much had too little power; and that, by reason of there being so many members present talking, the committee had the greatest possible difficulty in settling what the resolutions should be. The fact was that if, instead of having twenty or thirty men on the committee, they had but three or five, the work would be done much more expeditiously, and he believed more satisfactorily. So far from desiring, then, to increase the number of the business committee he, for this reason, would prefer seeing it reduced within something like a reasonable limit (Hear, hear). Again, it should be observed, that the gentlemen from the country had the appointment of the business committee already in their hands. As an old and experienced member of the Council, then, he would suggest what he considered would be the proper course. If they thought the Central Chamber had too much power, let them cut down the number of the committee from 24 to 12. He for one would be but too glad to find that it met their approbation. In the next place, he would recommend that the travelling expenses of the members of Council should not be paid by the Central Chamber—and it would be well, also, if the proportion of delegates to be sent by the district chambers were better regulated. First, they must contribute a certain amount of subscriptions; but care should be taken that the small rich chambers did not acquire a disproportionate number of votes in the Council by that means (Hear, hear). He would, therefore, suggest that the number of representatives sent by each chamber should be regulated by the number of members of which it was constituted, as well as the subscriptions they sent. It had been suggested that the president of the Chamber should be elected, not by the members of the Central Chamber, but by the general council. On that head if the general council would be good enough to undertake the appointment of the chairman he was sure the ordinary council would feel extremely indebted to them. At the present moment the Chamber was without a vice-president; and though the Council had requested several gentlemen to honour them by taking the office, they had had the greatest difficulty in finding one who was willing to do so. He only expressed the opinion of the Central Chamber council when he said that they would be but too happy to delegate that duty to the general meeting. One suggestion emanating from some of the provincial chambers was that their president for the year should *ex-officio* be a member of the Central Council. But that was the case now. They could elect a chairman for the whole year, or for every meeting, and send him as their representative, to act and vote on the business committee, and at the Council meetings. But was it a right thing that the Central Chamber should dictate to those district Chambers what they were to do? Let every Chamber do that which was right in its own eyes, and that difficulty was at once got rid of (Hear, hear). He moved: "That although it may appear expedient that some modification may be made in the laws and constitution of the Central Chamber, it is very undesirable to make any alteration until the whole subject has been carefully considered by a duly qualified committee, and this council, whilst strongly deprecating any hasty decision on such a [vital] question as the constitution of the Chamber, is of opinion that it could be wisely dealt with by referring it to a committee of ten members, including five

representatives of the Chambers who have expressed opinions favourable to a change in the Central Chamber." Having appointed such a committee he would then give them an instruction to the effect that the five members representing the Chambers which had expressed opinions favourable to a change should first of all meet and agree among themselves as to what changes they required (Hear, hear, and a laugh). They should then meet the other five members appointed by the Central Chamber; and he felt quite sure that if these gentlemen, before pronouncing a judgment upon the rules, would only read them, there would not be such a great diversity of opinion as now existed respecting them. Moreover, although the discussions upon this subject might have produced a little unpleasantness, if they met in a friendly spirit with a determination to do that which was best for the cause of agriculture, the Chamber would be more truly united than ever, and for that reason a greater power in the land (cheers).

Mr. MUNTZ seconded the resolution, and observed that it was not the case, as Mr. Read appeared to think, that the district chambers considered they had not sufficient power in the Central Chamber. There was quite as much desire on the part of the provincial chambers to secure unity of action, and impart increased strength to the whole body, as there was to make a change in the laws and constitution of the Chamber itself. It should be remembered, too, that the constitution of the Chamber was formed in the infancy of the institution; and that as the action of the Chamber was extended, some alteration must necessarily be required.

Mr. UMBERS, who supported the motion, dwelt upon the necessity of united action on the part of the agricultural chambers. What they wanted was to rally round then those who would be willing to supply the "sinews of war." He was often asked what the Chamber was doing and what it had done, and he wished that he had it in his power to give a satisfactory reply. He had always been one of the staunchest supporters of the Chamber; but what he wished was that men should of their own voluntary free-will come and throw their influence into the Chamber, instead of the Chamber going with entreaties to them for their help (Hear, hear).

Mr. WILD, in assenting to the motion, observed that in its origin the Chamber bore the character of a "club," composed of men who came there to enjoy themselves. Now, however, a number of provincial chambers were engrafted upon it, and the rules for its government should be adapted to the altered circumstances of the time.

Mr. BEACH, M.P., expressed his cordial concurrence in Mr. Read's motion.

Mr. PELL, M.P., as one who had taken an active part in the formation of the Chamber and the preparation of its rules, threw out the caution that, before proceeding to revise the rules, if a committee were appointed for that purpose, it would be necessary that they should have at their elbow some legal gentleman to take care that the amendments made were logical and in accordance with the principles and rules which governed other public bodies (Hear, hear). When the rules were drawn up he had the advantage of receiving the assistance of a leading barrister, and he believed they were so constructed as to hold water from one end to the other so far as the conduct of the business of the Chamber was concerned (Hear, hear). He was ready to admit, however, that they might be susceptible of modification or improvement in some respects—such as representation in the Central Chamber, the appointment of the chairman, and some other matters of detail. With reference to the remark of Mr. Wild, he begged to state that the 3rd rule clearly and explicitly anticipated the accession of local chambers, with the view of making up that great body which was called the Central Chamber of Agriculture.

Mr. LITTLE, of the Cambridgeshire Chamber, wished it to be understood that, in urging a change in the constitution, that body was not actuated by any hostile feeling to the Central Chamber. Mr. Read, in fact, had in his speech, conceded most of what they asked for, the most important of these concessions being that the representation of the local Chamber should be proportioned to the number of their members and the amount of their subscriptions, and that a new arrangement should be made for the appointment of the president. As to the business committee, they might or might not be too numerous, and it was true that they had power to add

to their number; but it made all the difference whether a man went into the room with that committee on mere sufferance or appeared on the list as an elected member of the committee (Hear, hear). He felt, therefore, that his Chamber was not wrong in urging that the business committee should be composed of an equal number of the Central Chamber and of the deputed members of Councils (Hear, hear).

Mr. BRAMLEY, speaking on behalf of the Lincolnshire Chamber, thought that if the twenty-six elected members of Council could be reduced to twelve, exclusive of the president and vice-president, the effect would be to add much to the business capacity of the Chamber.

The discussion was continued by Mr. Hicks, Mr. Bowen Jones, Captain Best, Mr. Duckham, Mr. Nield, Mr. Whitaker and Mr. Turner. Sir G. Jenkinson suggested, with the view of avoiding a "hitch," seeing that five members of the proposed committee were likely to go into it predetermined to effect certain alterations, that the whole number should consist of eleven, instead of ten. They would otherwise be likely to come to a dead-lock (Hear, hear).

The resolution as originally proposed by Mr. Read was, however, put and carried unanimously; and it was also agreed that the following gentlemen be appointed the committee to inquire into and consider the constitution and laws of the Central Chamber, and to report to a meeting of the Council specially convened for that purpose: Mr. G. F. Muntz (Warwickshire), Mr. Smith (Essex), Mr. Bowen Jones (Shropshire), Mr. Little (Cambridgeshire), and Mr. Bramley (Lincolnshire), as representing the five "reforming" chambers; and Sir Massey Lopes, M.P., Mr. Pell, M.P., Mr. D. Long, Mr. T. Duckham, and Mr. Read, M.P., the "constitutional party."

This matter disposed of, the annual meeting of the subscription members followed, when the report of the Council given above was formally received and adopted.

On the motion of Mr. C. S. Read, M.P., seconded by Capt. Craigie, Mr. Heneage, chairman of the Lincolnshire Chamber of Agriculture, and formerly member for Lincoln, was elected Vice-chairman of the Central Chamber for the ensuing year by an unanimous vote.

The next business was the election of eight members of Council in the place of the like number who retire from office by rotation.

On the motion of Mr. Whitaker, seconded by Mr. Wild, five of the eight retiring members were re-elected, namely, Mr. Thomas Willson, of Knaptost Hall, Rugby, Leicestershire; Mr. H. Genge Andrews, of Rington, Sherborne, Dorset; Mr. Thomas Horley, jun., The Fosse, Leamington, Warwickshire; Colonel Tomline, M.P., Riby Grove, Great Grimsby, Lincolnshire; and Mr. James Webb, of Spring Hill, Fladbury, Pershore, Worcestershire. The three other vacancies created by the retirement of Mr. W. Biddell, of Lavenham Hall, Sudbury, Suffolk, Mr. Jas. Howard, M.P., of Bedford, and the Earl of Lichfield, of Shugborough, Staffordshire (against whose names the attendances were marked *Nil*), were supplied by the election of Mr. Thos. Arkell, of Wiltshire, Mr. C. M. Caldecott, of Warwickshire, and Mr. Hodsoll, of Kent.

Mr. D. LONG, in consequence of the appointment of the Committee on the constitution of the Chamber, withdrew the motion of which he had given notice, to the effect "That a subscription of £20 shall constitute any person a perpetual honorary member of the Central Council, entitled to speak and to vote at all its meetings, but no travelling expenses of such perpetual honorary member to be allowed," as this subject will, *inter alia*, be referred to the consideration of the committee.

Mr. R. JASPER MORE proposed—and Capt. CRAIGIE seconded, "That the March meeting of the Council shall extend over more than one day." The mover urged as reasons for the proposal the example of the Chambers of Commerce, which always held their sittings for some days at the commencement of the Session of Parliament, and the opportunity it would give the Chamber of communicating with Members at the House of Commons."

Mr. NIELD objected to binding the Council irrevocably to extend the March meeting, and moved, as an amendment, the insertion of the words "may if necessary," thus vesting them with a discretionary power in the matter.

The amendment was seconded by Mr. CALDECOTT, and

being accepted by Mr. More and Capt. Craigie, the original motion, so qualified, was adopted.

Mr. T. WILLSON withdrew his notice of motion, "That the Business Committee comprise one member from each provincial chamber, in addition to the twenty-six elected members of Council of the Central Chamber," this too being considered a subject that properly came within the inquiries of the newly-appointed Committee. A notice of motion by Mr. D. Long, relative to the attendance and voting power of subscription members, was not pressed for the like reason.

Colonel TOMLINE, in taking his final leave of the Chamber at the close of his presidential year, thanked the gentlemen of whom it consisted for the uniform support he had re-

ceived at their hands in the performance of his duties. Our organization, he proceeded to say, is good, but the "power" is not here. The organization of the chambers of commerce, too, is excellent, and has been long established; but power is not there either. Their power is in the Board of Trade, in the Cabinet which include the Board of Trade, and in the majority of the House of Commons, where I hope the county members, who do not form a board of trade, will prove themselves vigilant and effective in the endeavour to promote our objects (loud cheers).

A vote of thanks to Col. Tomline for his services, proposed and seconded by Mr. T. WILLSON and Mr. D. LONG, was then put and carried by acclamation.

THE CENTRAL AND THE LOCAL CHAMBERS OF AGRICULTURE.

At the dinner of the East Suffolk Chamber of Agriculture, at Ipswich, Lord HENNIKER, the chairman, said he had heard many members of this Chamber say they did not get much good out of the Central Chamber, and that this Chamber should not subscribe to it. They desired to have a central authority, which would at a moment's notice put on any pressure necessary, and would have the co-operation of every Chamber in the country. It was all very well to say that there were other interests stronger than the agricultural interest, but they had a very powerful engine if they worked it properly. The agricultural interest might not be so strong as others, but it was quite strong enough to be heard and respected if it spoke out boldly. He should like to hear Col. Tomline's opinion, he having greater knowledge of the working of the Central Chamber, as to whether some change might not be adopted so that it might work more advantageously.

Mr. W. KERSEY said he had been a tolerably regular attendant at the Central Chamber, and the thing that astonished him more than anything else was the number of amendments that had been made upon amendments, the greater part of the time being occupied in disposing of them, and he was glad it was proposed to reduce the committee of 24 to 12, as he believed one of the results would be that the business would be better prepared for the Council and so many amendments would not be proposed. At the Game-Law discussion the amendments were so numerous that Col. Tomline, the president, was obliged to propose a battue amongst them. At the last meeting of the Central Chamber the absurdity of sending petitions to Parliament was spoken of. If there was one thing more absurd than another it was a petition. The only use that he had been able to find petitions were put to was to be kicked about by the patent leather boots of some of the young exquisites of the House.

Mr. H. BIDDLE said at the Central Chamber Mr. C. S. Read said he had heard it said that the Central Chamber had too much power. Mr. Read laboured under a misapprehension. The Central Chamber had not more power than it should have, but many thought whatever issued from it issued from the Chamber as a body in itself. He took it that was not the object with which the Chamber had been instituted. It was meant to be the executive that should carry out the opinions of the numerous Chambers scattered all over the kingdom. In consequence of the distance of the Chambers in the north-west and extreme south from London the representatives of those counties lying near the metropolis practically formed the Central Chamber, and he suggested that every subject brought before the Central Chamber connected with Parliamentary action should first be submitted to all Local Chambers, who should forward the resolutions they arrived at to the Central Chamber, and at the discussion there, whether their representatives were present or not, their resolutions should be counted in calculating the votes upon the resolution submitted to the Central Chamber. At present, when anything coming from the Central Chamber was submitted to Parliament, it was easy for their opponents to say it was merely the resolution of a certain body, some of whom were elected representatives, but the others were members by virtue of having paid a subscription and having been elected by their fellow-subscribers. What was wanted was a body that would speak with power and authority for the agri-

cultural interest. The House of Commons would pay more attention to the resolutions of the Central Chamber if they were assured that they were the embodiment of resolutions passed by Chambers all over the kingdom.

Mr. F. S. CORRANCE, M.P., said with regard to Chambers of Agriculture and their composition, he quite agreed with Col. Tomline that they had been struggling onwards, upwards, and forwards to attain a more recognised position, and he warned them not to be impatient with them. If these Chambers seemed not wholly to meet the requirements do not let them say "Break them up" and do not let them put them on another footing, which might turn out less suitable. The Central Chamber had done its work in that before a member dare take up a matter of great public interest affecting the agricultural portion of his constituents he was obliged to first consult the wishes of the Central and other Chambers. He did not care how imperfect the machinery might be by which this most important result was attained when once it was effected. The Central Chamber could not possibly accurately represent the feelings of all the local Chambers, but to a great extent it did, and, therefore, to a great extent it was successful. The suggestions which had been thrown out with reference to the Central Chamber seemed to him chimerical. Supposing Mr. C. S. Read, Mr. A. Pell, and others who had given much time and attention to it were removed, and there were a representation by delegates, the result would be that each would go deeply impressed with the importance of his own Chamber and of himself; and these men not knowing each other and the worth of each as a public man, would be scarcely able to co-operate and carry on the business in a business-like manner. The talk would be interminable and the business absolutely nothing. When, however, they had been guided by such men as Mr. Read questions had been very effectually dealt with. Of course the whole thing was a bold experiment, and no one had wished or worked more for success than he. Mr. Corrance then referred to the circumstances which led him temporarily to quit the East Suffolk Chamber. At the last annual meeting it was agreed to discuss the Game-laws. To that proposition he gave his most unqualified approbation. He felt convinced that confined to the Chamber and confined to men he knew to be competent to handle it, they might handle even such a nettle as this with comparative safety. Work in the House of Commons prevented his attending the other meetings, and when he came down to his great surprise he found that not only had the meeting at which the discussion was to take place been advertised, but it was converted into a public meeting.

Col. TOMLINE said, with reference to the remarks that had been made about the Central Chamber, he would tell them frankly what he had always thought. He thought it would be a short-lived institution, because he had always felt that the true Central Chamber of Agriculture was the House of Commons, and that their true representatives there were the county members, and for this reason—the power was there. He was glad to see impatience shown by some delegates that the Central Chamber had done little or nothing. It showed they wished for results, and to have results they must look where the power was. The Central Chamber had practically no power. It was in the local Chambers, where he hoped it would always remain, and in the House of Commons. It was

in the local Chambers and from their representatives in the House of Commons that practical results would be obtained. The Central Chamber had done nothing, but, on the contrary, had got an additional rate for education; but that was not the fault of the Chamber; he would not say whose fault it was—he personally voted against the additional rate—but no one had a right to blame the Central Chamber, which had no power to exempt the class which they represented and wished to befriend from the imposition of another rate. They had done good in one respect, in having organized throughout England centres of thought and energy and, as he believed, of action, which would attain the result the Central Chamber had been unable to attain. There were 91 Chambers throughout England, and surely one small room in Salisbury-square was not so fit a place for those Chambers to exert their energies as was the House of Commons, where they would act by their representatives. He had felt some time that the Central Chamber was, after all, a sort of convocation with the semblance of power without its reality. The Central Chamber had done one good thing; they had endeavoured to bring facts and details before the public instead of mere generalities.

Mr. T. HAWKINS said, as to the game question, he would not deprive the landlord of the pleasure of shooting, and he never heard of a farmer who would; but when he saw hundreds and thousands of farmers ruined by over-preservation of game, he could not help thinking it was wrong. He spoke

firmly, because he knew no farmer in the county had suffered more than he. In 1828 he began farming, and took an occupation in a bad state, expended a great deal of money in improvements, his landlord backing him up. He was bound by a game clause, and his landlord, having suffered losses in the railway mania, was obliged to let the right of shooting, and the consequence was that in sixteen years he (Mr. Hawkins) lost £2,500 by over-preservation of game. That was a cruel thing. Mr. Corrance, in the letters he wrote to the *Mark Lane Express* and the *Suffolk Chronicle*, talked about the farmers who attended the meeting at which the game laws were discussed, and said they were tainted with Jacobinism, that if they could not get what they wanted out of the landlords, they would claim their occupations as their own property; and those statements were unjust. He did not think Lord Henniker would give the Chamber of Agriculture such a stab as did Mr. Corrance in those letters, one in the *Mark Lane Express* and two in the *Suffolk Chronicle*, upon the motives of those who attended the meeting.

Mr. CORRANCE: I must ask the hon. member if he read the letters?

Mr. HAWKINS: Yes.

Mr. CORRANCE: Because what he says is absolutely contrary to their sense. I must ask all the members to read them.

Mr. HAWKINS said there was the most arrogant assumption in those letters. It was a regular Brutus-like stab to the Society.

THE INSURANCE OF FARM STOCK.

On Thursday, Dec. 8, on the invitation of a committee appointed by the Central Chamber of Agriculture, representatives of the Norwich Union, Sun, Phoenix, Royal Farmers', and Royal Exchange Insurance Companies attended a meeting held at the Salisbury Hotel. Mr. Charles Read, M.P., who occupied the chair, opened the conference by admitting that the Companies had for some time been losing by their farming stock insurances, and that, therefore, they were fully justified in altering their regulations; but whether those determined upon by the Insurance Companies were such as could with justice be enforced in every case was questionable; and that, therefore, the conference had been desired. The Chairman then proceeded to remark on the difference between the value of the produce of a farm immediately after harvest and at subsequent periods; on the inconvenience of having to take out new policies every year; and on fluctuations in value, and inquired whether the value for the purpose of insurance should not be taken on the average between the highest and lowest amounts of the year or on an average of several years. It was answered that practically it would be of no consequence whether the insurance was based on the highest or on an average value of the year; because, if on the average value the rate must necessarily be increased to create a sufficient amount to meet the losses and expenses; that farmers were quite as well qualified as merchants to state the value of their property; that farmers had seldom occasion to arrange their insurances more than once a year, while merchants had to watch the arrival of every ship in which they are interested, and to vary their insurances from day to day to keep themselves protected; that farmers had hitherto been, and are now, much more favourably treated than merchants, because they are only asked to pay on three-fourths of the highest value; while merchants, to be similarly protected, must pay on the whole value. As to taking an average on the produce of several years, it was answered that there was no possibility of satisfactorily ascertaining it, nor of obliging the owner to continue to insure with the same office for more than the current year.

It was asked whether, to avoid the necessity of full valuation in cases of loss, it would not be sufficient that the owner, when proposing his insurance, should give particulars of his land, and declare that the sum on which he proposed to pay premium was equal to the required proportion. To this it was replied that experience had shown that such declarations were frequently untrue; in proof of which a proposal of a Norfolk farmer was alluded to, when, on a valuation to test

the accuracy of his declaration, his property was found to be worth more than £8,000, while he had represented it as not worth more than £3,000, and proposed to pay on only £2,000. It was also stated that notwithstanding such declarations proposals had continually been declined, because the managers of the offices believed the answers could not be true in relation to the land cultivated. The representative of the Norwich Union Office took the opportunity of alluding to a paragraph which had appeared in the newspapers, and had stated that they had informed their agents that in the event of loss they were not to insist on a detailed valuation without special instructions. He said that, in the first place, the agents had nothing to do with the valuation of losses, and that all the office circular had said as to the valuers was that they need not require full particulars when they had good reason to believe the amount on which premiums had been paid was in accordance with the office regulations.

A supposititious case was put, viz., that of wheat being at 40s. per quarter when the insurance was effected and its rising to 80s., which was answered by saying that if the owner was so fortunate as to have the value of his property doubled, he could not reasonably expect to receive the higher price without first compensating the insurers for the increased liability. Allusion was made to the same rate and conditions being applied to scattered property as to that so placed that one fire could destroy the whole. It was replied that the same rate was not charged in every place, that in the fen districts it had often been charged ten shillings and sixpence instead of five shillings per cent., and even at the higher rate many offices would not insure it. Also that in fact those owning scattered risks did pay less, because those whose property was so placed as to be liable to be destroyed by one fire would for their own protection pay on the full instead of on three-fourths of the value; and that scattered risks were very much more exposed to tramps and other mischievous persons than the property at the homestead, which was generally too well watched for them.

In the course of the conference the subject of the ability of the managers of the office to form correct opinions on farming matters was spoken of, on which one of them said he must admit that he knew as little about farming as he did of the many other things which had to be rated, but he added, when particular subjects of hazard had to be considered, those who were thought best qualified to give information were applied to; and in the case of the new farming stock regulations,

he stated that, contrary to all precedent, a gentleman had been introduced at the meeting of managers, as a leading landed proprietor, and a good practical farmer, who had addressed the meeting and had urged the adoption of the regulations ultimately agreed to. Another of the managers, in allusion to complaints about the conditions of average, told the committee that they had always been applied to scattered risks other than farming stock; and in all Europe, except this country, to every single building, or property therein, and that therefore if the owner did not insure for the full value he must bear part of the loss. The alterations lately assented to in relation to root crops, insurance of single stacks, and stock placed in specified buildings, were mentioned, as was the subject of insuring machinery worked by steam, and hops. After some explanations to remove doubts as to what the office regulations really intended, the Chairman took leave of the representatives of the offices, saying he supposed the committee must report that the managers *would not* alter the terms, for which he was requested to substitute *could not*.

THE INSURANCE OF FARM STOCK.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—The communication which appears in Monday's *Mark Lane Express*, on "The Insurance of Farm Stock," contained one or two inaccuracies, which I feel called upon to correct.

In the first place it was I, and not Mr. Chas. Reed (the member for Hackney), who was chairman of the Committee of the Central Chamber of Agriculture. I did not propose that the average between the highest and lowest amounts of the year "should be taken as the basis on which to insure the three-fourths of the value." We admitted that it was fair that the amount of three-fourths of the value of the agricultural produce should be taken directly after harvest; what we asked was that *average crops and average prices* might be taken as a basis, instead of having to make fresh valuations and estimates at least every year. As to what was the average price, the tithe averages which have stood the tests of over thirty years would be the best standard, and if the wheat crop ranged from 3 qrs. to 5, it would be safe to calculate an average crop to be 4 qrs. The Committee considered that if each farmer stated the number of acres of arable and pasture land, his course of cropping, and the amount of his gross assessment to the poor rate, any office could with very little trouble judge if the sum proposed to be insured was sufficient.

The "supposititious case" was put to show that if a farmer effected an insurance at Michaelmas when wheat was low, and markets should rise, to make himself safe he would have to increase his insurance with every advance in the price of wheat; whereas if 7s. per bushel were taken as the standard price he would be paid 5s. or 10s. per bushel according to the market value at the time of a fire. It is idle to compare farming insurances with a merchant's risk. Agriculture runs pretty much in one constant groove from which averages could be fairly and accurately taken without much trouble. A merchant's transactions are so uncertain in time and amount that short policies with proportionately higher premiums may suit his purpose best.

The only point the offices conceded was a promise to *consider* whether they would not grant policies for less than 12 months in the case of hops. Your reporter evidently did not attend the meeting of the Committee with the non-associated Fire Offices, so I will add that although one and all expected that three-fourths of the value of the agricultural produce would be insured, they did not insist on the average clause, and were willing to take average crops and average prices as the basis of such value.

Should the Committee, in compliance with the courteous

request of the representatives of the Tariff Offices, report that the associated gentlemen *could not* alter their terms, it may be my painful duty to explain that they *could not*, simply because they *would not*.

I am, sir, your obedient servant,

CLARE SEWELL READ.

Howingham, Dec. 15th.

[We have referred this letter to the gentleman who favoured us with an account of the proceedings. He says: "Writing from memory only, I may have attributed to the chairman that which was suggested by some other person. As he now says the Committee 'admitted that it was fair that the amount of three-fourths of the value of the agricultural produce should be taken directly after harvest,' it appears to me that the only material question remaining is, whether, when a loss occurs, the valuation should be made on the worth of the property at that time, as is the case with respect to all other property, or on some other basis." Of course the Mr. Charles for Mr. Clare Read, not Reed, was a printer's error.]

THE NORFOLK CHAMBER OF AGRICULTURE.

At the annual meeting of this Chamber held at Norwich, Mr. C. S. Read, M.P., in the chair—

The SECRETARY read the report of the Council. During the past year the Norfolk Chamber had discussed the following subjects: The Best Mode of Providing for the Future Maintenance of Turnpike-roads and Highways, The Present Mode of Collecting Agricultural Statistics, The Best Mode of Providing for the Extension and Maintenance of the Education of the Industrial Classes, The Malt-tax, The Tax on Farm-horses, Local Taxation, The Tax on Guns, The Game-laws and Previous Legislation thereon, and The New Regulations made by Fire Insurance Offices for the Insurance of Farm Stock. The Council reported that a pecuniary loss had resulted to the Chamber through the failure of the late treasurer, Sir R. J. H. Harvey, who had at the time of his death £108 of the moneys of the Chamber in his hands. The Chamber, however, possessed a sum of £250 in Consols. The report and accounts were adopted.

The CHAIRMAN reported the result of a conference held between a committee representing the Associated Chambers of Agriculture and representatives of the chief fire-insurance offices. The result of the meeting had, he said, been substantially made known through the *Mark Lane Express*. The Committee wished to put the case as fairly as they could to the offices, and they stated that three-fourths of the agricultural produce on a farm ought to be insured, but they wished that average prices and average crops should be taken as the basis so that there should be no necessity for a fresh valuation every year. To this the associated offices replied, that they could not by any possibility consent. The Chambers of Agriculture also desired that there should be no question as to amount when a fire took place, but that a full investigation should be made at the time an insurance was effected. Another point put before the fire-insurance offices was, that there should be different rates for different risks, and that it was not fair that Norfolk farmers, who stacked their corn in their fields should be charged at the same rates as some Lincolnshire farmer who stacked his corn all in the homestead. The Committee were, however, told by the fire-insurance offices, that the same rates would apply to all.

Capt. BIGNOLD, on the part of the Norwich Union Office, said there was a distinction made by that office in cases where stacks were set all together, and where they were put in different fields.

The CHAIRMAN said two or three fire insurance offices, which were not combined tariff offices, would not insist upon the average clause.

The CHAIRMAN stated that the Chamber would have a claim against the private estate of the late Sir R. Harvey for the £100 in his hands at the time of his death, but it would have

no claim against the partnership estate of the Norwich Crown Bank. It was impossible to state what the dividend on Sir R. Harvey's estate would be.

The Chairman was elected President of the Chamber for the ensuing year. Delegates to the Central Chamber for 1871 were appointed as follows: The Hon. J. Walpole, M.P., North Norfolk; Mr. C. S. Read, M.P., South Norfolk; Mr. T. Brown, West Norfolk.

On the motion of Mr. H. S. GRIMMER, a memorial was

adopted to the Norfolk Quarter-sessions, soliciting a readjustment of the present mode of assessment, and suggesting that the Government ought to contribute more largely to the rates levied under the authority of the Quarter-sessions.

After some conversation in reference to a proposal about to be submitted to the Norfolk Quarter-sessions for a grant of £105 to Lieut.-Col. Black, Chief Constable of Norfolk, for his services in carrying out the Contagious Diseases (Animals) Act, the Chamber adjourned.

THE MOVEMENT ON BEHALF OF THE FRENCH FARMERS.

"The Agricultural Union of Rhenish Prussia is associated with us as honorary, the Royal Agricultural Society of England has admitted many of our members, and the Minister of Agriculture of Austria has become our colleague. I should never finish my address if I were to enumerate all the legions, home and foreign, who, while preserving their own banners, yet enter upon and unite with us in this peaceful crusade." It was thus that M. Drouyn de Lhuys spoke hopefully and cheerfully in only the Spring of last year in his office as President of the new Society of Agriculturists of France. And there was every reason to warrant the tone here adopted. A series of very successful provincial congresses had been inaugurated; while at the great meeting at Nancy "the proximity of Germany inspired the thought of inviting the agricultural associations across the Rhine to take part; as the appeal was responded to by the presence of intelligent farmers from Prussia, Austria, Bavaria, Wurtemberg, Baden, and Saxony." Immediately following upon this the report to a general meeting of the Royal Agricultural Society of England referred to an invitation from the Council of the Société des Agriculteurs de France, to take part in an international agricultural congress, to be held in Paris, in 1871. In our paper, again, of last week, a correspondence was published, wherein M. Drouyn de Lhuys occupies a prominent position, still, by his signature, as President of the Society of Agriculturists of France. The President, alas! of a Society, which at this moment has little more standing than an empty name; for that peaceful crusade of which its General spoke so encouragingly but a few months since has given way in the face of a more terrible campaign. The Prussian farmers no longer cross the frontier to discuss with their neighbours the cultivation of beet-root or the uses of salt. Those pleasant congresses are already forgotten in the stirring history of half-a-year's war, and the French farmer and the patient cottier see the art which they were cherishing so fondly thrust rudely aside, abandoned and despised.

And once more do Drouyn de Lhuys and the agriculturists of France turn towards England—not to invite her to join with them in the bloody crusade in which they are now engaged, not to suggest any friendly encounter in the way of breeding stock or employing machinery, no longer as rivals but the rather as suppliants. "The scourge which desolates our fields not only exhausts our actual resources, but also threatens to destroy the means of future produce." And upon this hint the English farmer has acted, or, the more to his honour, has anticipated the appeal. The movement to which we referred last week for supplying the small occupiers in France with seed really originated here, for as M. Drouyn de Lhuys writes it, "Mr. James Howard conceived the generous idea of aiding the French cultivators who are the victims of the war." And on Monday we saw this idea promptly acted on; if anything, indeed, perhaps somewhat too promptly. The meeting was called so closely on the heel of the Smithfield Show week that it was not reasonable

to expect to see many agriculturists again in town. Moreover, the notice was of the shortest, many only receiving a summons on one day inviting their attendance on the next, while there was of course no opportunity of making any more general announcement through the agricultural journals. We are not, however, inclined to attach any great weight or significance to the comparative scantiness of the company assembled in the long room at the Salisbury. There was amply sufficient demonstration to show that, in common parlance, the thing would take. In fact, looking either to those who had the conduct of the proceedings or to those who spoke to the resolutions, there was strong evidence as to how thoroughly the several connecting links of English agriculture were represented. We quite concur with the remark of the chairman, Lord Vernon, as to the bad policy of attempting to identify the movement with any particular public body, nevertheless it was easy enough to check off all the leading agricultural institutions, while other great influences like the implement makers, the seed merchants, and the corn dealers, it was also evident would be brought into service.

Of the farmers themselves we have no fear whatever. If the machinery employed be effective without being troublesome, there is little doubt but that almost any amount of seed corn in reason may be obtained. Of course it will be necessary for every man who holds anything like a position as a public man in agriculture to bestir himself over this business. The resolutions of the meeting ask as much, and the credit of the country requires as much. But we had almost said that any such movement amongst farmers should be limited to subscriptions "in kind." Indeed, after the two or three bad years so lately experienced, it would be unfair to ask for more. Men like Mr. Robert Leeds at the meeting may find it a saving of time to write down their names for five guineas there and then, but there are others in a smaller way who would readily find a few bushels of corn though they could not so easily spare the money. An agricultural contemporary has discovered this very recently, the attempt to put about the usual subscription list having resulted in a most unmistakeable failure, although, as we must repeat, we are very sanguine as to any application for corn being cheerfully responded to.

Manifestly "the means" for collection and distribution must be looked for elsewhere—amongst, as we may distinguish them, the monied classes. Lord Vernon heads the list with a subscription of £50, and the landlords of England will follow his example; Mr. James Howard gives £50, and the implement makers will follow his example; Sutton and Sons give £100, and the seedsmen will follow their example; Mr. Albright gives £100, and the corn-merchants will follow his example. And so on, as there is by the early list just published scarcely a collateral interest but which has already made some sign. And we should be almost jealous enough to see the proposal begin and end here. There was some appearance at the meeting of the movement

extending to a general one, but this was never intended, nor is it desirable. There are many other channels through which the public can tender aid to the sufferers from the war; but this is eminently a class manifestation, coming from a class for a class. The English farmers are anxious to assist the French farmers at a time of great

need, and it may be well to wait and see what they will or what they can do. In fact, the agriculturists of this country are put, as it were, to the test of what their sympathy is worth, and they must not disappoint the promise which has been made in their name. It is broached to them as a very duty of this Christmas time.

CALENDAR OF AGRICULTURE.

In northern latitudes, which comprehend the full half of the British isles, this month is the stormiest period of the year; snows lie deep, and frosts are severe with a long continuance. This weather reduces farm labour altogether to the carrying of articles and materials that are wanted for in-door use and in preparations for future purposes, as of stones to drains and roads, of fuel to the households on the farm, and of all kinds of manures. In the end of the month begin to carry the contents of the cattle-yards, to be placed in heaps in the fields intended to be planted with early green crops, as potatoes, beet, and Swedish turnips. Lay the heap in a lane or in a convenient place of the field, near the gateway, on dry and level ground; slope the heaps at both ends, see that the loaded carts can pass upon and over it, and spread the strawy and moist faeces evenly over the space, oblong in shape and about six feet in height, the edges and ends neatly dress, and, when finished, with earth placed over the sides to prevent them drying and blowing about. The heap may be raised at two or three times, and the treading by the carts is intended to prevent the present fermentation of the materials, which is promoted by turning over the heap by hand-forks very carefully ten to fourteen days before being used on the land in May. The fermentation being at that time in full operation, will convey a ready and powerful support to the germination of seeds. Another method raises the heap without treading or pressure beyond one person to spread the materials, on banks of four or five feet in width, extending the width of a heap, that is, nearly square. The loaded carts are run back to this bank, on to which the materials are dragged, and spread thinly and evenly over the extent, and raised to about six feet in height, and the sides and edges neatly dressed. This mode produces an immediate fermentation, which proceeds so long as caloric is evolved by the contents of the mixed articles, and has ceased by the time of the dung being used on the land. In forming the heaps, attention is paid to the mixing of the dry and moist straw and faeces, to produce an equality of manure, and that the whole heap of materials be in a proper condition of moist putrescence from the yards, affording the necessary convenience to procure the equally moistened and mixed state of combination. Opinions differ in respect of the two modes of preparation—of an active fermentation when the seeds are sown, or of a black putrid mass of dung, from which all activity has disappeared. The first may be the quickest, and both may be equally durable, and may be soon superseded by the moveable railway carrying to the field at the time of use the fresh dung from the yards, that has been carefully mixed and moistened, of faeces and straws, cut into short lengths for litter by the steam thrashing machinery. This application will very justly banish all heaping of dung and the already exploded doctrine of fermentation, but it must worm its way, as a corkscrew, through a concreted mass of conceit and prejudice ere it reach an expanse of bottom on which to show a convincing superiority.

Sell and deliver all grains to the merchant; keep short accounts with the granary and the cart ledger.

During the fresh and open weather of the month, general in the southern latitudes, sow wheat on any fallows deferred for any reason from the autumn season; and also on strong turnip loams, cleared by the roots being removed and pulled away, only being consumed on the ground by sheep. This season of sowing wheat, and even a month later, succeeds well in the south of Scotland and in the north of England, but fails in the southern counties, and even in mid Britain, being later in ripening and of an inferior quality from an unknown cause.

Plough the lighter turnip soils for fallow crops, as the loose texture does not require so long an exposure for pulverization. Plough grass lands and stubbles for Lent crops, very favourable during this month, as it affords a time for pulverization before sowing; and it does not, by a lengthened exposure of the land in a ploughed state, reduce it into a hard battered condition. The ploughing of lands for crops and for root fallows must be vigorously pursued and ended with this month. Plough all lands deeply rather than shallow, the width and depth of the furrow being nearly equal. The slice cut by the share and coulter below ground must be thinly formed and raised, and placed by the plough in a strictly vertical position, and pressed into it by the shouldered width of the mould-board. In this position the narrow upright comb affords a fresh alluvium to cover the seed in the seams, and enables the harrow to work its purpose of a dead level surface of fine earth, deep and loosely produced. This object being gained, it matters not what initial letters mark the plough, or if any prize has been gained by an H. or an R.

Continue the cutting of copses and underwoods, the cutting and splashing of hedges, the scouring of ditches and roadsides, and clear watercourses; cut drains to half the depth, to be finished in summer. Float water meadows, and lay dry occasionally.

Plant forest trees of all kinds on farm grounds, as in corners beyond the reach of the plough, in clumps on knolls, and in single standards for scenery, and for rubbing posts in permanent pastures. In all cases erect a sufficient protection in a fence, or post-and-rail. Plant young hedges of thorns, choosing the strongest sets of the nursery, to be cut into lengths of a bud at each end, and placed on a sloped turf of earth on the surface of the ground, in about four inches apart, covered with the best soil with a heap of loose earth placed loosely on top, to hold moisture and to defend from drought. A rail fence must protect the plantation on both sides.

The live stock on the farm of all kinds will demand the breeder's constant attention, in order to rear animals into profit and to derive advantage from his labours, never forgetting the great effects of minute care in increasing the produce of a farm. Supply the cattle in the houses and yards with fresh straw daily, and give turnips or other roots early in the morning, to be consumed during daylight, to prevent accidents being unseen. Turnips are drawn from the field as wanted, but the danger of heavy snows covering them, or rains preventing access to the ground, renders necessary a heap of the

homestead for a few weeks' supply. The yards must be littered very frequently, thinly and evenly.

The milch cows will now begin to drop calves: feed with succulent food, with roots and chaffs steamed. Suckle veal calves, and for weaning also, as it ever produces the most healthy and thriving animals, from the milk passing into the stomach of the animal without exposure, which evaporates the best parts of the fluid in a gaseous form, and hence the superiority at suckling over hand feeding. If any dairy produce be wanted, use a part of the cows for that purpose, and the other for rearing calves. Allow ample food in every case. Have the calf-pens divided into single apartments, of about eight feet by four feet; the floors pierced with anger holes to allow the moisture to escape, with a door opening into the cowshed from the end or from behind, as the width of the shed may admit. Suckle the calves thrice a day, and keep the pens dry, warm, and very clean.

The sheep flocks must have fresh food daily in turnips rooted, but not topped, consumed on grassy or stubble grounds, for the different flocks of ewes, keeping flock, and the fattening division, as arranged after autumn, each purpose requiring a greater or less allowance of food. The lambs of last year on the best allowances and the fattening flocks consuming the green food on the ground, will require a change every two or three days of food and air.

Feed work-horses with cut chaffs of hay, clover, and straws; with oats and beans in a measured quantity. Any warm meal is not recommended for horses, as the exposures to so many weathers in the course of work renders the animal very susceptible of change. The horse is a dry feeder, and chooses the dry produce of plants.

In the piggery feed largely and litter amply. Rear the store pigs in a roomy yard, with shelter sheds, on roots, as potatoes and beet; the fattening hogs that

live in sties, with two animals in each, feed with steamed potatoes mashed and mixed with meals, given in warm portions thrice daily. The pig is the only animal that is benefited by cooked food, and no beast produces the same quantity of flesh on an equal quantity of bones, or from the same quantity and quality of food.

Feed poultry with light grains and with mixed meals, or steamed potatoes, placed in troughs under the shed of the yard, to suit the shovel bills of ducks and geese. The separate apartments for each kind of animals must be kept clean, and the boarded floors being warmed underneath by hot water pipes from the cooking-house, will very much favour the laying of eggs and the hatching of chickens during the cold months of the year.

The thrashing of grains must be regularly done to supply straws for chaffs and litter, with the grains for the special purposes. The flail supplies these articles during all seasons of weather; by machinery, the thrashing will be done at fixed intervals, and largely during hard weather. The straw barn will hold much of the scutched culms, which may also be cut into short lengths by the knives of the machinery, and used for chaffs and litter from the places of deposit. The thatched rick of grain in the morning converted at the close of day into grains dressed for market, and into chaffs and litters, the latter carried and scattered over the cattleyards by the same power that conveys the materials to the machinery, is a performance that well agrees with the steam and rapidity that now propels the force of human thoughts and actions, leaving the flail and its employers to be standing marks of the force of the current by which the rest of the community are borne along. Immoveably moored in one position by the weight of anchor and the strength of cable, the monuments are alike impregnable to reason and argument, though resting on the very powerful supports of the useless expenditure of time and money.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

So uncertain is the weather at this season, that it is impossible to do more than suggest. At all events, they who desire to have lettuces, radishes, and salads early, must be possessed of frames and lights. We do not allude to forcing, but simply to protection—yet this will imply some kind of linings, either of dung, fern, or straw, laid so thick around the box and lights, or brick pits, as to exclude the frost of 20 degrees, which often comes and lasts many days. Every vegetable grown in frames should have air in fine intervals by day; but sashes should be closed every night, and covered, whenever it freezes, with straw mats, the most effectual means of defence that can be constructed.

If the weather and ground be open, the green and white cos lettuce, and the brown Dutch, and also a sprinkling of short-topped radish, can be sown on a warm border—the earth should be free, open, and rich, to promote quick growth, and straw or fern should be at hand to be thrown over the ground during hard nights. Sow radishes twice.

A little horn carrot seed, a drill of round spinach, some mustard and cress, may be sown; but little good will result in general.

Peas and broad beans should be sown at least 2½ or 3 inches deep, in soil enriched in the autumn.

Earth up peas and beans, if any be ready, observing to select the driest weather. Transplant cabbage from the seed beds.

If frosty, protect the frames and cauliflowers under glasses; celery by a couple of boards laid ridgewise, only straw on each side of the ridges. Wheel out manure to be ready for plants, asparagus beds, &c., &c.

FRUIT DEPARTMENT.

Prune very little, unless the buds swell materially: lay manure around the roots of gooseberries, currants, and raspberries: it very much improves the spring growth. Do the same also to fruit trees and espaliers.

If snow abounds it must be shaken clean from all evergreens before the sun shines out, nothing tends so effectually to prevent scalding and other accidents of the foliage. Do nothing in the way of planting flowers, but sow seeds in pans, mark each, and place them in a frame. Much time and labour are economised, and flowers better secured by this method of proceeding.

The digging and trenching of waste grounds is well done during this month, and placed in a rough surface to imbibe the benefits of exposure, and the alternations of rains and snows, frosts and thaws. Moderate frosts will permit this digging, while the severest hardenings of the ground will reduce the operations to the preparation of manure, and the wheeling of articles for that purpose. The compost heaps may be well turned over, and the mixtures of dry and wet materials very carefully attended. A uniformity of quality is much to be attained. Carry small earthy bodies to the dry compost heap, and the more bulky materials to the liquid pit, to be saturated with urinary and soapy liquids, which are imbibed by

earthy bodies, to be conveyed to the soil as an active manure in the best acknowledged form.

The open weather of the month affords very favourable opportunities of planting trees of all kinds in the orchard, in clumps or single standards, shrubs, and fruit-bearing bushes, and all plants that are ligneous and arborescent, and which are propagated by young sets and slips. The choice must be made of healthy plants of medium height and strength; the fibres of the roots must be pruned and cut to a moderate distance from the stem, called root-pruning, which is successfully done with grown trees, and the excavations filled with guano-earth. The incisions of the fibres cause fresh shootings, which are more vigorous than the old threads of the roots. Trees do not require trenching of the ground or the digging of pits; the surface of the ground should be raised by the spade in a depth of six inches in a bed shaped to receive the tree in a bulk, a sprinkling of guano-earth strewed beneath the set, and the earth trod firmly around the stem to hold its position. The surface in a yard around the stem to be covered with

a thick mulch of very moist strawy farm-yard dung, with frequent applications of water, in order to convey downwards the liquid oozings to the roots of the tree. These applications relate wholly to fruit trees and ornamental single standards, that are very much wanted to adorn any landscape, and to form a scenery.

The fruit-bearing shrubs of the garden are planted in manured grounds, and do not need any better conditions; but mulch may, nevertheless, be useful to all fruits, as is shown in the case of raspberries. The covering excludes drought, retains moisture, and sinks a cooling benefit to the roots. All plants show a strong generic affection, and thrive best in congregations of the same kind.

Boxwood in borders and thorns for fences are well planted during this month.

The notices of sowing the seeds of early vegetables can apply only to the most favoured situations of soil and climate, but in all moderate cases the expense is small and the trouble not great, while the possession of early vegetables is both a variety and a luxury.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR DECEMBER.

The past month has, on the whole, been seasonable, especially towards its close. Early in the month the weather was warm, and out-door farm labours were rapidly proceeded with, and agricultural affairs were more forward than usual. Ploughing and sowing were interrupted at one period by the heavy fall of rain, but as a rule these operations had been completed by the close of last month, and it was therefore only in a few late districts that the delay was experienced. The wheat plant in the early southern counties is now fairly above ground, and, so far as can be judged at this early period, is promising in appearance, the plants looking strong and healthy. Root pulling has now been generally completed, and the results have proved to be more satisfactory than was anticipated. This is especially the case with mangolds, swedes, and the heavier roots, the yield of which is but little, if at all, below the average. The greatest falling off is in the turnips, which suffered too heavily by the drought to recover when the rain at length fell. The prospects of feed for the cattle are, therefore, more encouraging than could have been looked for, considering the dry character of the past season.

At Mark-lane prices have been mainly guided by the course of the war, and the market has presented alternately considerable animation or depression. The quotations show but little change on the month, though many fluctuations have taken place, and as we write the tendency of the quotations is in an upward direction. Stocks decreased considerably during November, but the arrivals this month have been large, and the granaries are again well stocked for the time of year. The cold weather has had the usual effect of stimulating the demand for wheat, while the heavy export inquiry, which has continued for some weeks past, has induced holders to be very reticent in parting with the produce in their possession. A large demand on French account appears inevitable as soon as communication with the French ports is practicable, and especially on the fall of Paris. How long the latter may be delayed is involved in great doubt, but a large quantity of cereal produce must be immediately available to supply the pressing wants of the famished inhabitants. Obviously England is now the most convenient entrepôt for grain, owing to the political situation on the Continent and to the difficulty of obtaining remittances from other quarters at the present moment. Accordingly, a large quantity of the cereal produce now on the way and nominally intended for the English market, is really destined for French and other ports. During the month a large number of vessels have been diverted to the French coast, while heavy shipments have been made to Belgium and Holland. This latter movement is the natural result of the war, and is to be attributed to the waste and destruction which invariably follow military operations. The

month opened with an average price for wheat of 52s. 5d. per qr., and closed with an average of 52s. 7d. per qr. Farmers' deliveries of wheat have been fairly extensive, but the quality and condition of the samples have varied with the weather. Most of the parcels exhibited at Mark-lane towards the close of the month were in very indifferent condition, but subsequently some improvement was apparent. The slight decline which has taken place is attributable to this falling-off in quality.

Plentiful supplies of spring corn have come to hand, farmers having thrashed out barley freely. As a rule the quality of the barley has been inferior, and there has been some difficulty in disposing of secondary sorts at the rates quoted, the supply being heavy. Fine malting descriptions, however, being scarce have commanded full rates, though the trade has ruled quiet in sympathy with the inactivity prevalent in the malt trade. There is very little German barley in the market and no French.

Oats sold freely at the opening of the month, and prices were well supported; later on, however, the quotations gave way, but the market subsequently became firm again on the setting in of cold weather.

Maize has been similarly influenced, the market closing firmly with a good consumptive demand. The export inquiry for both maize and oats has been steady, and liberal shipments are looked for so soon as the obstacles to trade are removed.

Beans and peas have been scarce, and the quotations have shown a constant tendency upwards.

Prices of wheat, both in America and on the Continent, are relatively higher than those current here, and shipments at the present moment are, therefore, restricted. The quantity of grain on passage, however, is large for the time of year, and further additions may be looked for as soon as the navigation is re-opened. From the Baltic our receipts have been very small in consequence of the war, and they are likely to continue so as, owing to the draft of the able-bodied population into the army, there is little hope of moving the produce to the ports of shipment. With regard to the American trade it is noticeable that a large proportion of the wheat sent forward from the Western States has been detained on the canals, having been bought up by speculators with the intention of influencing prices in the Eastern markets. This experiment, so utterly opposed to all common sense, has been so frequently tried and has so frequently failed that it is a matter of wonder that it should be practised in. In the end, however, it is sure to defeat itself, as on previous similar occasions.

The hop trade has ruled quiet throughout the month. Supplies have been liberal, the crop this year having proved one of the best on record, both as regards quantity and quality. Prices of fine new English are without material change, but

yearlings have been altogether neglected. Bavarian and American hops have tended downwards in value.

As usual at this period of the year the demand for artificial feeding stuffs has been heavy, and this has been further stimulated by the shortness of the hay crop. It must be observed, however, that the grass lands recovered themselves to a considerable extent towards the close of last month, and presented a favourable appearance late into December. So much so that the cattle were kept out in the fields until an unusually advanced period. Cakes have risen in value, while prices of hay and clover have been well supported.

In the wool trade considerable activity has prevailed, notwithstanding the absence of French and German buyers. The demand has chiefly run on choice qualities, and fine Down hogs have commanded very full prices. It is expected that the trade will rule steady, as the manufacturing trade is likely to be favourably influenced by the war later on.

The metropolitan markets have been well supplied with potatoes which have sold freely at fair quotations. The falling off in the imports has naturally tended to sustain values.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

The feature of the month, so far as the cattle trade has been concerned, has been the holding of the Annual Market for the sale of fat stock for Christmas consumption. Although both in point of numbers and in the quality of the stock, the Show could not be said to equal previous years, it was nevertheless a success, after due allowance has been made for the many drawbacks which presented themselves to the rearing of fat stock during the summer months. It will be remembered that the severe drought which prevailed, soon reduced the pastures and meadow-lands to an arid condition, and resulted in the partial failure of the hay-crop. The root-crops also did not yield so freely as was anticipated; consequently, the supply of food was materially reduced, whilst the price was in a corresponding degree enhanced. The coolness of the weather has imparted a firm tone to the trade, and during Christmas-week the best breeds realised as much as 6s. 4d. per 8lbs.; but the general top figure has not exceeded 6s. per 8lbs.

As regards sheep, the supplies have been tolerably good, and the quality has been improved. Although not active, the trade has been firm, and the best Downs and half-breeds have been disposed of at 6s. 2d. to 6s. 4d. per 8lbs.

Calves, of which a moderate supply has been on sale, have been in fair request, at steady prices; but pigs have sold slowly, at about late rates.

The total imports of foreign stock into London during the month have been as under:

	Head.
Beasts	10,293
Sheep	37,943
Calves	1,709
Pigs	1,943

Total 51,888

Same time in 1869	44,815
" 1868	17,231
" 1867	38,336
" 1866	34,658
" 1865	66,721
" 1864	41,712
" 1863	34,435
" 1862	25,435
" 1861	21,904
" 1860	20,795
" 1859	17,430

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

From—	Dec., 1870.	Dec., 1869.	Dec., 1868.	Dec., 1867.
Lincolnshire, Leicestershire, and Northamptonshire	8,500	7,620	7,845	9,700
Norfolk, Suffolk, Essex, and Cambridgeshire	1,620	1,900	550	2,000
Other parts of England	1,830	2,480	2,330	2,500
Scotland	2,054	1,954	2,190	1,710
Ireland	1,820	2,990	1,292	1,042

The total supplies of stock exhibited and disposed of at the Metropolitan Cattle Market during the month, have been as under:

	Head.
Beasts	26,490
Sheep	93,360
Calves	1,606
Pigs	1,067

COMPARISON OF SUPPLIES.

Dec.,	Beasts.	Sheep.	Calves.	Pigs.
1869	25,689	94,170	1,948	680
1868	17,770	81,780	935	1,070
1867	21,910	92,490	943	1,880
1866	20,750	71,390	1,053	1,950
1865	31,720	126,170	2,823	2,930
1864	23,780	78,410	1,441	2,700
1863	29,302	88,470	1,150	2,680
1862	25,810	85,621	1,354	3,082
1861	24,840	84,630	701	2,950
1860	24,540	82,340	1,577	2,445
1859	24,484	78,989	1,171	2,187
1858	20,523	74,275	1,473	2,450
1857	19,830	67,132	1,209	1,915
1856	23,995	73,200	1,525	2,880

Beasts have sold at from 3s. 6d. to 6s. 4d., sheep 3s. 6d. to 6s. 4d., calves 3s. 8d. to 6s. 2d., and pigs 4s. 4d. to 6s. 4d. per 8 lbs. to sink the offal.

COMPARISON OF PRICES.

	Dec., 1869.	Dec., 1868.
	s. d. s. d.	s. d. s. d.
Beef from	3 4 to 5 10	3 2 to 5 8
Mutton	3 6 to 6 0	3 0 to 5 6
Veal	4 2 to 6 0	3 8 to 5 10
Pork	4 4 to 6 4	3 6 to 4 8
	Dec., 1867.	Dec., 1866.
	s. d. s. d.	s. d. s. d.
Beef from	3 4 to 5 2	3 4 to 5 6
Mutton	3 4 to 5 0	3 8 to 6 4
Veal	4 4 to 5 4	4 2 to 5 10
Pork	3 2 to 4 2	3 6 to 4 6

In the dead meat markets the supplies have been good. The trade has been firmer, and prices have been maintained. Beef sold at from 3s. 4d. to 5s. 4d., mutton 3s. 8d. to 5s. 4d., veal 5s. to 5s. 4d., and pork 3s. 4d. to 5s. 4d. per 8lbs. by the carcase.

THE METROPOLITAN GREAT CHRISTMAS CATTLE MARKET.

The season has certainly not been favourable to the raising of stock, and, taking into consideration the partial failure of the grass lands and the high prices current for artificial feeding stuffs, the show of stock at market this morning was good. The number of Cattle on sale were not large, owing to the restrictions imposed on the foreign trade, and probably the actual weight of meat as compared with the number of Beasts exhibited was under the average of years. The Scotch Beasts, for instance, came to hand freely, there being about 1,200 animals from North Britain; but, though they were well-shaped and in excellent condition, as a rule they were not of extraordinary weight. The prices realized were high, but must be regarded as moderate when the expense attending rearing this year is taken into account; and, even at present rates, it is doubtful if the profits secured by graziers will be large. The prices now current certainly pay, but as a set-off we must bear in mind not only the forced sales compelled by the shortness of grass in the Midland and South Counties, but the ravages caused by disease throughout the country. Our North Country graziers suffered less from the shortness of fodder than we have in the South, for there has been little or no drought in Scotland this year, and this fact was well apparent in the quality and condition of the Beasts exhibited. As a rule, the prolonged mildness of the weather has enabled graziers to keep their stock out in the field until a later period than

usual, but in the south this has been of little avail as the grass has been deficient, and what there was was not of a meat-producing character, being deficient in nutriment. It will be readily understood that the Scotch graziers kept up the reputation at this Monday's market, and as far as quality and purity were concerned carried off the palm. The exceptional circumstances which have this year tended in their favour would have led us to anticipate this. In point of numbers the Shorthorns came first, while cross-bred animals were numerous; but there was a marked falling off in the arrival of Hereford cattle. A few North Devons were exhibited, but we have had very limited arrivals of the breed for some time past.

The foreign arrivals call for little remark. The numbers were small, and consisted of Dutch and Spanish animals. Last year there were some excellent French beasts on sale, but to-day they were conspicuous by their absence. At the waterside there was a good arrival. The Irish beasts call for no especial observation.

The annexed return shows the number of Beasts exhibited, and the prices realised for them on the "Great Days" during the last 29 years.

Year.	Beasts shown.	s.	d.	s.	d.
1841 4,500	8	8 to 5	0
1842 4,541	3	4 to 4	8
1843 4,510	3	8 to 4	4
1844 5,718	4	0 to 4	6
1845 5,826	3	6 to 4	8
1846 4,570	4	0 to 5	8
1847 4,282	3	4 to 4	8
1848 5,942	3	4 to 4	8
1849 5,765	3	4 to 4	6
1850 6,341	3	0 to 3	10
1851 6,108	2	8 to 4	2
1852 6,271	2	8 to 4	0
1853 7,037	3	2 to 4	10
1854 6,181	3	6 to 5	4
1855 7,000	3	8 to 4	2
1856 6,748	3	4 to 5	0
1857 6,856	3	4 to 4	8
1858 6,424	3	4 to 5	0
1859 7,560	3	6 to 5	4
1860 7,860	3	4 to 5	4
1861 8,840	3	4 to 5	0
1862 8,430	3	4 to 5	0
1863 10,370	3	6 to 5	2
1864 7,180	3	8 to 5	8
1865 7,530	3	4 to 5	4
1866 7,840	3	8 to 5	6
1867 8,110	3	4 to 5	0
1868 5,820	3	4 to 5	8
1869 6,728	3	6 to 6	2

The following are the particulars of the best portion of this morning's market:—

At Mr. George Dickson's stand were exhibited nearly 350 Scotch beasts, which, although not heavy, were of very fine quality, and quite up to the average of seasons. The vendors from Aberdeenshire were: Messrs. Knowles, Wishart, Mitchell, Wylie, Beddie, Frost, Bruce, Reid, Lawson, and others. From Banffshire, Messrs. Longmore, Stoddart, Milne, and others. There were also some fine lots from Forfar, Inverness, and other parts.

Messrs. Giblett and Son had for disposal some remarkably fine Scotch beasts, including about 40 the property of Mr. William McCombie, M.P., which sold at an average price of £45 per head. There were also some fine beasts of Messrs. James Martin, Thomas Knowles, Harry Adamson, J. Reid, W. Gordon of Aberdeen, and A. Mennie of Huntly.

At Messrs. Maydwell and Hoyland's stand the best lots were forwarded by Messrs. William Wallace and

George Strachan of Turriff, Lewis Strachan of Olney, James Gordon of Olney Castle, Aberdeen, Phillips of Sonderton, Murray of Tafferty, Reid of Greystone, R. Elmalie, Ingram, and others of Vale of Alford, and J. Stoddart of Banff.

Mr. Vorley's stand was as usual occupied with a good show of animals; whilst at Mr. Thomas Dixon's stand there was a good supply of Beasts from Norfolk, Lincoln, and Leicestershire, in addition to some very fine Oxen forwarded by Thomas Mouser, of Sherborne, Gloucestershire, one of which carried off a prize at the show.

The Sheep pens were filled with some excellent breeds in prime condition. Messrs. Henry Lintott and Sons had for disposal some choice animals from Hertfordshire, Essex, and Surrey, and also some Down wethers, the property of Mr. Hobgen, which carried off the prize at Chichester.

At Mr. Collin's stand there were some prime Downs which realized extreme quotations.

Mr. Dodd had some remarkably good pens of Sheep, including some show Downs; the consignees were Messrs. Lawrence, House, King, and Franklin.

In Mr. Weall's pens there were some fine Downs and half-breds from the counties of Bucks, Herts, Berkshire, and Oxfordshire.

Mr. Stallibrass had some very fine Downs, the property of Lord Braybrook, of Audling End, Saffron Walden. Messrs. Bolton and Son also had some good Downs.

STATE OF THE TRADE.

Influenced by the unfavourable weather and the comparatively long time between this and Christmas, the trade for Beasts opened rather quietly. Nevertheless, the general superior quality of the stock imparted a firm tone to the quotations, and extreme rates were realised, the best Scots and crosses were disposed of at from 5s. 10d. to 6s. 2d. per 8lbs.

From Lincolnshire, Leicestershire, and Northamptonshire we received about 2,100 Shorthorns, &c.; from Norfolk, Suffolk, Essex, and Cambridgeshire 1,620 Scots and crosses; from Scotland 1,200 Scots and crosses; and a fair supply from Ireland.

The show of Sheep was good, both as regards number and condition. Although not active, the trade was firm, and the best Downs and half-breds were disposed of at 6s. to 6s. 4d. per 8lbs.

Calves were firm on former terms. Pigs sold at late rates.

GLOUCESTER CHRISTMAS FAIR was moderately well supplied with stock. The demand was good, especially for beef, which realized from 8d. to 9d. per lb., and in some instances nearly 10d. Mutton was in short supply, but sold freely at from 8d. to 9d. per lb. Bacon pigs sold more cheaply than on last market-day; prices were from 9s. to 10s. per score. Pork from 11s. to 11s. 6d., and all sold.

GRANTHAM FAT STOCK MARKET.—A small show of sheep; trade very brisk, at 8d. to 9d. per lb. Pork 8s. to 8s. 3d. per stone.

LEDBURY FAIR was very thinly attended with stock of every description, which met a dull sale. Cows seemed to change hands, but there was very little little doing in sheep and pigs. Beef 9d., and mutton 8d. to 9d. per lb. Over 350 head of sheep passed under the hammer; fat sheep sold at from 43s. to 63s. 6d.

SHREWSBURY FORTNIGHTLY FAIR.—There was a very small show of stock of every kind. Everything good and fit for the butchers sold well, but there was very little demand for store stock. Good beef found ready sale at from 8d. to 8½d. per lb., inferior selling very much lower. There were very few sheep, good mutton fetching from 8d. to 9d. Pigs were very low, as low in proportion as they have been for some time high. Bacon pigs realized very little more than 6d. per lb.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The month has been characterized by great fluctuations in the weather. It opened very mild and rainy, then came a moderate frost, which gradually increased into intensity everywhere, hardening the ground, and suggesting great severity for the winter; but before the first fortnight was reached, down came the rain in heavy and continuous supplies, with a temperature milder than we sometimes experience in spring, and finally came frost and snow again. The frost was serviceable, as it did not much stop the plough, and greatly facilitated the carting of manure, &c., while it enabled the farmers to thrash out enough wheat for Christmas engagements. But the floods which have since ensued in some low grounds stopped all field labours, and the meadows have been too sodden for the cattle in the fields. A heavy requisition will now be made upon the root crops, and they will be lucky who keep stock without loss. As regards the young wheat, the early-sown is both forward and strong, and the mild temperature will help the vegetation of the late sowings, while those who deferred this work must look for a favourable opportunity in spring. Politics, lately threatening to Great Britain, seem happily settling into calm, neither the state of the Black Sea nor Luxemburg now being likely to bring on a war; but our neighbours the French continue to have it in full, and all Europe begins to say when will this end. There seems as yet but little chance for France; but the Prussians may yet find it more difficult to return than they did in advancing. The wasting of a fine country is a serious matter; and when we learn from a late French official of eminence that 200 square miles have lost the autumn tillage and seed-corn, it is enough to make us fear for the next spring, and still more for the next harvest. Yet the English wheat trade has remained dull. For the first fortnight a rise and subsequent fall of 1s. kept the balance equal; but the oppressive dampness of the last fortnight has brought such damage into the condition, that we must note for the whole month a decline of about 2s. So far as regards English samples, the loss is more apparent than real, for the bulk increases as the weight diminishes; but it has stopped business, and affected the value of granaried foreign nearly as much where no complaint of condition could be made. The approach of the holidays has also doubtless tended this way, for but few like to send their accounts at such a time of the year. There is therefore every probability that for a short period we may keep dull, though all the markets of Europe remain firm, without any symptoms of giving way. When peace comes, as we hope it will shortly, and the damage by war comes to be carefully estimated, we may find a sudden large demand spring up, which will stimulate prices. At New York they have somewhat declined; but the navigation of the canals must soon close, when we shall be left to shipments ex granary till next May, regulated by relative prices, which are now nearly equal, shipping charges and risk included. The following rates were recently quoted at the places named: the best new Zealand wheat at Rotterdam 59s., 61lbs. Danish at Hambro' 58s., Danish wheat from Copenhagen for spring delivery 60s., cost, freight, and insurance; the finest new high-mixed Dantzic 61s., cost, freight, and insurance; wheat at St. Petersburg 45s. 6d., free on board; Ghirka at Odessa 47s. 9d., cost, freight, and insurance, at Taganrog 45s. 6d., cost, freight, and insurance; native wheat at Marianopoli 47s. 6d., cost, freight, and in-

surance; at Valparaiso 52s., cost, freight, and insurance; at San Francisco 56s. 8d., cost, freight, and insurance; old No. 2 Milwaukee 49s. 3d., cost, freight, and insurance, per 480lbs.

Our this month's review commences on 28th November, which could not be included in our last.

The first Monday commenced on small English supplies, though the foreign arrivals were good. The morning's exhibition of samples was the smallest since harvest, yet sales were excessively dull, at 1s. decline, the weather having become very mild and wet. Most of the foreign supplies consisting of American samples, these as well as Russian qualities experienced a like reduction. Though fair arrivals were noted off the coast there was no decline in prices. With the aspects of politics more decidedly pacific, the country advices generally noted symptoms of weakness. Leeds, Lynn, Melton Mowbray, and a few other towns reported a reduction of 1s. to 2s.; more were down 1s.; among these were Spalding, Sleaford, Hull, Ipswich, St. Ives, Gloucester, Gainsborough, and Newcastle; yet Bristol, and some other places, were firm, the show of samples being limited, and on Saturday there were similar reports. Liverpool was down 2d. per cental on Tuesday, but this was recovered on Friday. A decline was prevented at Edinburg by the smallness of the supply; but Glasgow was 6d. to 9d. per boll lower. The Dublin market was dull, both for native and foreign wheat, but there was no quotable change.

On the second Monday the supplies were less both in English and foreign samples. There was but a limited show on the Essex and Kentish stands during the morning, and the weather being changed to cold and dry a better feeling sprung up, and the loss of 1s. on the previous Monday was fully recovered. It was the same with the lower qualities of foreign; but fine Baltic sorts were unaltered in value. Floating cargoes improved fully 1s. per qr. during the week, with a good inquiry. This week the country markets very readily responded to the London advices. Hull, Spalding, Sleaford, Melton Mowbray, Newark, Louth, Rugby, &c., were all 1s. to 2s. dearer. A rise of 1s. was also reported at Birmingham, Bristol, Bury St. Edmund's, Alford, Leeds, Lynn, Gainsborough, Rotherham, Stockton, &c. Some localities, however, were simply firm, and Liverpool only advanced 2d. per cental for the week. Glasgow was 6d. per boll dearer, and Edinburgh reported a rise of 1s. to 2s. per qr. The only feature to be noted at Dublin was great firmness both in native and foreign qualities.

On the third Monday the English supply was moderate, and very little was reported in foreign, excepting from San Francisco, whence a large shipment was made. No great quantity was exhibited this morning on either the Kentish or Essex stands, yet the winterly weather having changed to mild and rainy, which somewhat affected the condition, former prices could only be realized for the few fine and dry samples; the rest could only be sold by making some concession to buyers. Though there had been some activity in foreign on the previous Friday, with an occasional advance, that buoyancy was entirely lost, and only the previous Monday's rates were retained. With few cargoes arrived at the ports of call prices were unaltered. The weather this week being mild and very wet the general condition of samples suffered, and most of the country markets responded to the London advices of Monday, being 1s. per qr. lower, but there were a few

exceptions, some farmers naturally expecting the return of frost and some improvement in the condition of their wheat, others knowing the difficulty of selling and reluctant to make any sacrifice shut up their sample-bags without exhibiting the contents. Liverpool on Tuesday was down 1d. to 2d. per cental, but no positive difference in value was noted. At Edinburgh prices were 1s. lower; Glasgow was unaltered, but dull. At Dublin sales were very slow.

On the fourth Monday there was about an average supply of home-grown wheat, with a good foreign arrival, nearly all from Montreal and New York, in about equal quantities. The show of fresh samples on the Kentish and Essex stands was limited, but the condition was so bad millers would hardly ask the price, though a reduction of 1s. to 2s. would have readily been conceded. The foreign trade also was without any animation at 1s. less, though there were free sales of floating cargoes at full rates. On Friday the 23rd, with a return of frost the market became firm.

The arrivals into London for four weeks were 27,719 quarters English, 82,548 quarters foreign; against 18,174 qrs. English, 161,903 qrs. foreign for the same time last year. The London exports for the same period were 16,816 qrs. wheat, 17,986 cwt. flour. The imports into the United Kingdom for four weeks up to the 10th December were 2,394,688 cwt. wheat, 326,934 cwt. flour; against 3,627,893 cwt. wheat, 448,815 cwt. flour for the same period in 1869. The general averages commenced at 49s. 10d. and closed at 52s. 2d. The London averages began at 54s. 2d. and ended at 55s. 10d.

The flour trade for four weeks has generally been steady, though on the fourth Monday there was a reduction in the value of Norfolks to the extent of 1s., which brought them down to 36s. In foreign sacks there was also a similar reduction, though stocks are not large. Barrels rose on the second market 6d. through an extensive foreign demand, but this was finally lost, leaving prices much the same. Extra State New York being quoted 26s. 2d. cost, freight, and insurance, shows them to be 2d. above London quotations. At New York stocks were estimated at about 350,000 barrels. The imports into London for four weeks were in country sorts 95,802 sacks, foreign 5,896 sacks 58,854 barrels; against 91,991 sacks country, 7,142 sacks 20,361 barrels foreign last year.

In maize there has been a quiet trade through the month, with very little change of value, only a reduction of 6d. being noted on the fourth Monday, bringing the quotations of yellow to 31s. to 32s., and white to 33s. The imports during this period into London were 29,403 qrs., against 42,861 qrs. in 1869. The American crop, which was large, will not be available till after the opening of the canals in May.

Of barley the receipts of British growth have been moderate, and so were the foreign till the fourth Monday, when 21,000 qrs. arrived, this brought the market down fully 6d. for low sorts, and about 1s. for the heavier qualities. English malting barley has been dull, excepting the very finest, which has continued scarce. So heavy indeed is the sale of second-rate sorts, that it is difficult to note their real value. This has arisen from the extremely dull state of the malt trade for a long time past. The arrivals in London for four weeks were 10,350 qrs. British, 81,612 qrs. foreign, against 15,299 qrs. British, 46,180 qrs. foreign, for the same period last year. There appears now no chance for a rally in malting qualities.

The malt trade, as already noted, has been extremely depressed at declining rates, the reduction in the month being 2s. to 3s. per qr. Brewers report they are full, and the demand for beer very slack.

The oat trade has continued to fluctuate with the

weather and foreign demand. It advanced 1s. per qr. when large orders came from Antwerp, though the arrivals were then at their height. When this demand closed, old oats rather gave way, and new were 6d. cheaper. Old Russian, weighing 38 lbs. per bushel, could be had at 22s. 6d. per qr., and 40 lbs. new Swedes at 23s. 6d. Scotch oats have nearly been out of the market, the receipts having only been 195 qrs., and therefore prices quite at a fancy height—say, over 34s. for parcels of extra weight. The rates being moderate for feeding qualities, we do not see much chance of a decline, though Christmas time is always dull. The arrivals during four weeks into London were 3,252 qrs. English, 195 qrs. Scotch, no Irish, 183,817 qrs. foreign, against 5,641 qrs. English, 346,904 qrs. foreign in 1869. So the foreign supplies this year have only been about half what they were then, and from these are to be deducted 26,080 qrs. exported, chiefly to Belgium, it is supposed for the German armies. With a poor crop in France, as well as here, there must be a great want of this grain at the close of the war.

The supplies of English beans have hitherto been fair for a scanty crop, with almost nothing from abroad; but prices have been kept down by the relative cheapness of Indian corn, which is being more largely used. The trade has therefore been dull, without any quotable change of value. Extra fine old small English still bring as much as 54s., though new Mazagans will not bring over 40s. The imports into London were 3,932 qrs. English, 726 qrs. foreign, against 3,323 qrs. English, 10,086 qrs. foreign in 1869.

In peas there has scarcely been any change, inferior old white going off for feeding purposes at 86s. per qr., while white English boilers of first quality are worth 42s., and maples have even brought 46s. in retail from their scarcity; duns being worth 38s. The imports into London for four weeks were 2,888 qrs. English, 4,697 qrs. foreign, against 2,882 qrs. English, 10,527 qrs. foreign in 1869.

With good supplies of linseed from India, prices have given way about 1s. per qr., the imports being 78,543 qrs., against 46,704 qrs. last year.

The seed trade has kept its firmness, with now and then a speculative inquiry for red cloverseed. Fine new English is quoted as high as 86s., and white at 80s. per qr. Spring tares are now coming to hand, but the demand has not commenced yet.

PLATE III.

A SHORTHORN STEER.

THE PROPERTY OF MR. THOMAS PULVER, OF BROUGHTON, KETTERING.

This steer, bred by Mr. Pulver in the spring of 1867, was by Biddingham (21277), out of Beauty, by Brighton (25672), a cow not to be traced in the *Herd Book*. Brighton was a son of Bagshaw's Windsor (23225), out of Princess Alice by Pompey (10622).

Biddenham, the sire of the champion steer, a roan bull, bred by Sir W. de Capell Brooke, passed into the possession of Mr. Pulver. He was by Lord Stanley Spencer (20229), out of Ruth 2nd by Hero of Kars (19956), her dam Ruth by Habeas Corpus (10294). Lord Stanley Spencer was bred by Mr. Charles Howard, at Biddenham, and hence the title of his son.

The following is a complete list of the prizes taken by this steer :

1868.—Third prize at Oakham	£4	0	0
1869.—Second at Northampton	5	0	0
Second at Ashby-de-la-Zouch	5	0	0
First at Lincoln	10	0	0
Second at Oakham	5	0	0
First at Leeds	10	0	0
1870.—First at Royston	5	0	0
First at Peterboro'	10	0	0
First at Hinckley	10	0	0
And Cup for best beast	5	0	0
First at Wellingboro'	10	0	0
And Hope's Cup	5	0	0
First at Oakham	15	0	0
Extra Uppingham School Cup	25	0	0
Silver medal	3	0	0
First at Birmingham	15	0	0
President's Cup	25	0	0
Hotel-keepers' Plate	25	5	0
Lord Aylesford's for best Shorthorn	15	0	0
Gold Medal for best ox	20	0	0
Extra for best Shorthorn	20	0	0
Silver medal for breeder	3	0	0
First at Smithfield Club (extra stock)	10	0	0
Champion Plate	100	0	0
Silver medal	3	0	0
		364	5	0
Sold to Mr. Sheepway, of Gloucester, for .		100	0	0
		£464	5	0

It was thus that we wrote of this steer immediately after the last Birmingham meeting: "At the Oakham show in 1869, Mr. Pulver, a yeoman of Broughton, near Kettering, showed a Shorthorn steer, by Biddenham, a bull from Mr. Charles Howard's Spencer tribe, but bred by Sir W. de Brooke, that took a second prize in an All-England class to Mr. Roland Wood's Little Wonder, the best beast in the show. Young Biddenham then came on to the Smithfield Club Meeting, where in the certainly 'crack' class he was only highly commended; Lord Aylesford's steer, the best animal of his year, being first, Mr. Wood's Little Wonder second, and a steer of Lord Penrhyn's third. Still one of the judges said, 'if kept on for another year, this very stylish steer will be sure to command a foremost place.' Mr. Pulver thence travelled his beast on to Leeds, where he won in his class, but never was in it when the judges came to find the best animal in the yard. During the past summer and autumn he took invariably first prizes for fat stock at Peterborough, Royston, Hinckley, and Wellingborough; as at Oakham, again, he was not only the first of his class, but the best beast in the show. He had thus 'run through' many of the animals he met in his own class at Birmingham. It will be so gathered that if there were any great merit in Mr. Pulver's ox, he could have no difficulty in his path so far. And he has indisputably great merit in many ways. He is a smart rich roan in colour; he is a compact square rather than an overwhelming animal; he has fed so well that his flesh does not seem to encumber him as it does many a fat beast, but he has a cheerful look and gay carriage, as it is not until you see him out that he moves after a somewhat awkward ungainly fashion. He has an especially good forehead, is well ribbed up, and straight and square in his outline, but bad in his purse, having suffered terribly from castration, and standing rather weak from behind." The live weight of the steer as given in the Smithfield Club catalogue was 20cwt. 3qrs. 14lb., and his dead weight

815st. 5lb. of 8lb. to the stone. He died remarkably well, of a very good colour, and Mr. Pulver, as chairman of the ordinary, put a 64lb. piece of him on the market table at Kettering, of which forty-six partook, with an ample allowance of lean meat to give everyone "a taste."

On the Champion Plate being presented to him at the general meeting of the Smithfield Club, Mr. Pulver said: "It was now twenty years since he first appeared as an exhibitor at the Club Show, and when he did so he was unsuccessful, although he obtained a commendation. Some of his friends then told him that it was useless for him to show in the same class with noblemen and gentlemen, the length of whose purses made them more than a match for his skill and perseverance. However, in spite of this counsel he resolved to persevere, and subsequently he had taken a great number of prizes, alike first, second, and

third, as well as received some commendations; and he did not cease his exertions until he had carried away the first honours of the yard. He ventured to say that his ox had made more money than any ox in England before; for he had taken 23 first prizes, two second, and one third, the total amount of which was more than £360. When he had done exhibiting, too, he should receive £100 for him. Next week he would go to Leeds, and if liked there, he anticipated that he should win 50 guineas more. That he thought would be making more money than any other animal had every done."

The steer could not go on to Leeds in consequence of the outbreak of Foot-and-Mouth disease in the Agricultural Hall, but he was as well as ever when he reached Gloucester, where he was shown to some thousands of people, and sold at a shilling a pound.

PLATE IV.

HAWTHORNDEN; A THOROUGH-BRED COLT.

THE PROPERTY OF MR. T. V. MORGAN, OF CHELSEA.

Hawthornden, bred by Mr. G. Healeop in 1867, is by Lord Clifden out of Bonny Blink, by the Flying Dutchman, her dam Prairie Bird, by Touchstone—Zillah, by Reveller—Morisco, by Morisco—Waltz, by Election—Penelope, by Trumpator—Prunella, by Highflyer.

Lord Clifden, bred by Mr. J. A. Hind in 1860, is by Newminster out of The Slave, by Melbourne, her dam Volley, by Voltaire—Martha Lynn, by Mulatto—Leda, by Filho da Puta—Treasure, by Camillus. After winning the Woodcote at Epsom as a two-year-old, Lord Clifden was sold twice within the week, first to Captain Christie for £4,000, and then to Lord St. Vincent for 5,000 gs. In his lordship's colours he won the St. Leger, as many to this day maintain he also did the Derby, although the judge gave it a head against him. He was in work one of the very handsomest or grandest horses we ever saw, the ideal of excellence and symmetry, and perhaps at all points, on the day, the most magnificent Derby favourite that a crowd ever followed, as he is said to have still further improved in his appearance since taken out of work. Lord Clifden went to the stud in 1866, when he stood at Mr. G. H. Thompson's Moorland farm at Skelton, near York, where he remained until the close of this last season, when he was sold to Mr. Gee, and is now located at Wadhurst, in Sussex. Lord Clifden's stock consequently came out as two-year-olds in 1869, when he was credited with the following winners: Catalonia, First Lord, Fleu d'Oranger, Malaria, Rosalie, Sophie, and Hawthornden, while a son of his won one of the great three-year-old races in the first season it was possible for one of them to do so. Amongst his further winners are Moorlands, Herod, The Bee, Lady Scarlet, Rebecca, Bare-

foot, Chick, Heirloom, Piccadilly, Ainsty, Ringwood, and Hohenlieden.

Bonny Blink, bred by Mr. R. Wright in 1857, never ran, but was sold as a two-year-old to Mr. Healeop, a Durham farmer, who put her to the stud in the following season with this as the return: in 1862, Governor, by Mildew; 1863, Marshal Ney, by Arthur Welleley; 1864, The General, by Arthur Welleley; 1865, Catton, by Mildew; 1866, Luna, by Camerino; 1867, Hawthornden, by Lord Clifden; 1868, Herminie, by Camerino; 1870, a filly, by Costa, when the mare was again put to Lord Clifden, from the merits of Hawthornden having got about.

Hawthornden is a blood bay horse, standing rather over fifteen hands three inches high. He has a good long head, a strong neck, with his shoulders somewhat upright and thick at the point. He is good in his girth, but not particularly so in his middle or back. He has muscular quarters, well let down to powerful hocks, and has plenty of bone, but he stands a little back in his knees. Hawthornden is altogether a horse of some character, having of late much improved in his appearance, but he is still very easily picked to pieces.

Hawthornden, first called Blue Light, was sold as a yearling to Mr. Heene, for 250 gs.; but in consequence of ill health Mr. Heene's stud was sold at Tattersall's on the Thursday before the Derby of 1870, when Hawthornden was knocked down, under Lord Exeter's conditions, to Mr. T. V. Morgan for 900 gs., and his half-sister Herminie to the same purchaser for 800 gs. The colt was transferred from Jones' stable, at Compton, to Joseph Dawson, at Newmarket.

Hawthorne.
London: Published by Rogerson & Worsfold, 265 Strand, B.C.

There has been a deal of idle talk as to why Hawthornden was occasionally beaten here and there before Doncaster, but his general performances can make him at best but a moderate horse; and his winning the St. Leger now reads very like one of those inexplicable flukes asso-

ciated with the results of some of the great races. Beyond his doings on the turf and with steeple-chase horses, Mr. Morgan is known in the City as the managing partner of some plumbago works, somewhere about Battersea.

TOP-DRESSINGS FOR WHEAT.

BY CUTHBERT W. JOHNSON, F.R.S.

The improvement of the produce of our soil is a theme which will well repay our repeated examination. And here, again, we are cheered on by the good results of observing Nature's modes of improving her soils, and availing ourselves of her suggestions. When the early cultivators of our island noticed the fertilizing results of the deposit of earthy matters on their pastures by the floodwaters, they were led to employ marl and clay as dressings for their lighter soils. Chalk-pits, which are of the period of the Roman occupation, still exist in Sussex. Other operations of dame Nature, of great importance, have only in recent times been discovered; thus, in the rain, the snow, and even in dew, we are now aware that minute quantities of ammonia, nitric acid, and also phosphoric acid descend upon our soils.

When the great Lincolnshire and Cheshire farmers first employed so successfully crushed bones for their wet-crops and their pastures, they had no suspicion that the heavens had been in all times fertilizing their land by a similar application: neither did those who first used the nitrates of potash and soda, or the ammonia in Peruvian guano, know that they were only imitating the waters which fell on their soils from the clouds. And yet, as such is the case, it ought to render us ever watchful of the suggestions vouchsafed to us on every farm, and ever to conclude that we have exhausted all the profitable readings in dame Nature's book.

That the top-dressings not applied by man are sufficient to keep the soil from becoming utterly unproductive of a crop of wheat, has been long known—and as on some soils to a very remarkable extent. And now, as in the case of Jethro Tull, and Smith of Lotham, conclusions have been arrived at, of far too universal application. In the case of those valuable experiments carried on by Mr. Smith, and by Messrs. Lawes and Gilbert at Rothamsted, very useful results were obtained. In those cases wheat was grown, year by year, on the same unmanured land. And it will be well if we refresh our memories by referring to their report of these facts we examine the results of some other still more recent trials on top-dressing wheat.

There is, however, a primary question of great importance to be considered before we proceed in our examination, viz., whether we have any reason to conclude that the produce of our wheat crops has approached the limits which the land can yield no more seed. Now, we may all cheer ourselves on by remembering that, from the time of the Tudors, the average produce of our wheat has gradually increased from perhaps 10 or 12 bushels per acre to 28 or 29; and, moreover, the possibility of the land sustaining far larger crops of wheat than has yet yielded by our best-cultivated farms, has been

proved by many extraordinary exceptional crops, and of these perhaps the most remarkable was that grown in the year 1844, at Haisborough, in Norfolk, on a field of 5½ acres, about half a mile from the sea. It yielded of Spalding's wheat 11 quarters 2 bushels per acre. Of the cause of this, and other recorded great crops, we have not any information; but, whatever may be our present want of knowledge, that is not a reason that we should conclude that by no future discoveries we can hope to attain to a far greater average produce of wheat than any that we have yet accomplished. That it is most important that our produce should be increased, needs no argument—the fact that, in the sixteen years between 1852 and 1868 one-third of the corn consumed in our islands was of foreign growth, is alone sufficient to show how desirable it is to increase our home-growth of wheat. The following table, constructed by Messrs. Lawes and Gilbert, furnishes the estimated quantity of wheat available per head of the population within each harvest year (Sept. 1st to August 31st):

Years.	ENGLAND AND WALES.		
	Total per head, bushels.	From home produce.	Per Cent. From Imports.
1852-3	5.7	68	32
1853-4	5.8	64	36
1854-5	6.8	91	9
1855-6	5.3	87	13
1856-7	5.7	79	21
1857-8	7.5	76	24
1858-9	6.3	82	18
1859-60	5.0	82	18
1860-1	6.3	52	48
1861-2	6.4	61	39
1862-3	7.1	65	35
1863-4	7.6	78	22
1864-5	6.4	83	17
1865-6	6.1	72	28
1866-7	5.4	65	35
1867-8	5.1	55	45
Mean.....	6.1	73	27

Having thus glanced at what our soil can produce, and the need we have of an enlarged home produce, let us next examine what a soil can unmanured, continuously, yield.

In the Rothamsted experiments, wheat was grown for more than twenty years on a soil which the authors describe as fair average wheat land. But—as the rental of similar land in the immediate locality ranges and has ranged for many years past only from 25s. to 30s. per acre, tithe-free, and its wheat crop under the ordinary management of the district, certainly does not average more than 25 to 27 bushels per acre—it is obvious that in a practical point of view, it can lay no claim to extraordinary fertility or to be ranked on a higher level than a large proportion of the soils on which wheat is grown, with a moderate degree of success, under a system of rotation and home manuring. It was on such a soil that, with

only the aid of the unmanured earth and that of the substances falling upon it from the heavens, crops of wheat were grown for twenty successive years ; the land in each year yielding a crop whose amount will be found in the following table. In this tabular statement, the first column gives the season, and the second column the total amount of corn produced per acre.

Years.	Lbs.	Years.	Lbs.
1844	923	1854	1,359
1845	1,441	1855	1,072
1846	1,207	1856	892
1847	1,123	1857	1,236
1848	952	1858	1,141
1849	1,229	1859	1,031
1850	1,002	1860	738
1851	1,093	1861	736
1852	860	1862	996
1853	359	1863	1,127

Here then we have a considerable answer to a very important question, viz., to what extent of produce can the soil yield a crop of wheat, and of wheat only for many years, unmanured? We have already noted that in small proportions, nitrogen in ammonia, and in nitric acid, is supplied from the atmosphere. In the experiments instituted at Cirencester other important questions were put to dame Nature, relating to the effect of an artificial addition of nitrogen to the wheat crop in the shape of nitrate of soda, either by itself or united with superphosphate of lime. These important researches are thus described :—

These experiments were restricted to superphosphate and nitrate of soda. 1st, separate; 2nd, combined; 3rd, applied in winter; 4th, applied in spring. Simple as these experiments may appear, the following list will show that they entailed a formidable series of plots :

Two plots dressed at the rate of 3 cwt. per acre of superphosphate, and 1½ cwt. of nitrate of soda, applied together in winter.

Two plots dressed at the rate of 3 cwt. of superphosphate, and 1½ cwt. of nitrate of soda, applied together in spring.

Two plots dressed with 3 cwt. of superphosphate in winter, and 1½ cwt. of nitrate of soda in spring.

Two plots dressed with 1½ cwt. of nitrate of soda in spring.

Two plots dressed with 1½ cwt. of nitrate of soda, applied in two equal portions, the last dressing distributed one month after the first.

Two unmanured plots for comparison.

Several plots on the College Experimental Farm were, in addition to the above, dressed with similar applications, double the amounts per acre being employed. In these experiments the following questions were put to the soil :

First, what is the measureable effect of nitrate of soda in increasing the wheat crop ?

Second, what increase is obtained by supplementing a dressing of nitrate of soda with superphosphate ?

Third, how does the period of application affect the result of a certain dressing ?

Fourth, may nitrate of soda be applied at two periods, instead of at once, with advantage ?

Fifth, is a heavy dressing, say of 3 cwt. of nitrate of soda, more effective than a dressing of 1½ cwt. ?

These questions, to some extent, have been answered, in some cases clearly and definitely, in others with more or less uncertainty. Even the most definite answers must only be looked upon as correct for a particular soil and season, and therefore a repetition of some, if not all, the experiments is desirable.

The following experiments upon the application of nitrate of soda to wheat, 1869, were at the Royal Agricultural College at Cirencester :

Applied.	Amount per acre.	Total grain per acre.	Increase per acre.	Average increase.	
	lbs.	lbs.	lbs.	lbs.	
March 25.....	} 336	2490	970	} 863.3	
May 1					
March 25.....	336	2090	570	} 1060	
March 24.....	336	2570			
March 24.....	} 336	} ...	
May 1					
March 24.....	168	1800	280	} 423.3	
March 25.....	} 168	1990	470		
May 1				} 520	
March 24.....	168	2040			
...	...	1640	} 1520=average of three unmanured plots.		
...	...	1560			
...	...	1360			

The next series of experiments upon applications of manure to wheat, 1869, were by Mr. Smith of Bibury :

	Applied.	Quantity of manure per acre.	Grain per acre.	Increase per acre.	Straw per acre.
		lbs.	lbs.	lbs.	lbs.
Nitrate of soda	April	80	3280	190	4440
ditto	April 10 ...	} 168	3280	590	4580
ditto	May 10 ...				
ditto	April	168	3200	440	4190
ditto	April	168	3200	440	4440
Unmanured	2760	...	3500
Superphosphate	...	336	} 3740	980	5900
Nitrate of soda	...	168			
Superphosphate	January ...	336	} 4060	1300	6160
Nitrate of soda	...	168			
Superphosphate	...	336	} 3220	460	4740
Nitrate of soda	...	168			
Superphosphate	...	336	} 3500	740	5420
Nitrate of soda	...	168			

Then we have the following results of the trials in 1869 upon wheat, by Mr. Ruck, of Braydon Manor Farm :

Plots (1-20th acre each).	Date of application.	Quantity of manure used per acre.	Weight of grain per acre.
		lbs.	lbs.
Nitrate of soda (applied at twice)	{ Apr. 13 May 13	} 168	2400
			2520
Nitrate of soda (applied at twice)	{ Apr. 13 May 13	} 168	2460
			2580

Another very important branch of our inquiry relating to the wheat crop is the comparative productiveness of different varieties of seed. The Highland Society of Scotland not long since directed their attention to this question, and they awarded premiums for different reports of several laboriously-conducted experiments—the first to Mr. R. J. Thomson, of Kilmarnock. In his trials in 1864 and 1865 the produce per acre was as follows :

	1864. Qr. bu. lbs.	1865. Qrs. bu. lbs.
Hopetown	4 2 5	8 0 11
Woolley Ear	4 5 0	8 2 4
Fenton	4 4 40	9 0 39
Hunter	4 2 0	7 5 51

The second premium was awarded to Mr. P. Turnbull, of Dunbar (*ibid.*, p. 352), for his experiments in the years 1864 and '65. The produce he obtained per acre of good grain in these years was—

	1864. Qr. bu. pk.	1865. Qr. bu.
Hunter	3 6 2	5 3
Hopetown	4 0 1	4 5
Shirreff	4 5 2	4 3
Fenton	4 7 1	5 0

The third premium was given to Mr. J. Richardson, of Preston Kirk, in East Lothian, for his trials in 1864 and 1865. The produce he obtained per acre of good grain, in bushels and lbs., was as follows :

	1864. Bu. lbs.	1865. Bn. lbs.
Mungoswell	38 25	33 21
Hopetown	34 61	35 34
Hunter	34 60	37 19
Fenton	38 61	39 36

The very different amount of seed obtained in these trials, from three or four varieties of wheat, will not escape the reader's attention. There is no reason, indeed, to doubt that much is to be profitably accomplished by selecting seed better adapted to the soil and climate of a district than has hitherto been deemed probable, and the same remark will well apply to the other branches of the inquiry to which I have in this paper briefly alluded ; indeed, whoever will only steadily study in Nature's book will be pretty certainly rewarded by valuable readings which time will, in all reasonable certainty, never exhaust.

“OVER MY PIPE.”

I've been roaming, I've been roaming where the meadow grass is sweet ;
And I'm coming, and I'm coming with the dew upon my feet !

This means, under exceedingly strong metaphorical language, that I went down upon the occurrence of the thaw to inspect the condition of our river bank, and to note what effect the drifting ice might have upon the protective piers, the history of which I have in these columns gradually detailed. They have now been proved to be such a thorough success that I have the greatest satisfaction in explaining minutely, for the benefit and guidance of those amongst your readers who may desire to save a swiftly-wasting bank from the undermining action of an insidious stream, not only the several points in which our plan has answered, but also the weak points that we have had to mend. In the first instance, every river-wise person that we met or spoke to when our project was in embryo said that what we had to do to save the bank was to plant “sallies”—that is, willow cuttings—along it, mentioning several instances of very successfully encouraged accumulation at several turns of the river. They always overlooked the fact that in each of these cases the gathering took place upon the slack, not the current side of the stream. There where the weaker water rested it was only too glad to have anything, stick or stone, to cling by or lean against, and let the mud drain out of its shoes. But upon the other side where the stream was wearing against its earthen barrier (as

you may see a hungry, poaching old sow go trying with her snout along the lowermost rail of the prohibitive fence) planted bushes could serve no earthly purpose, save as a buffet for the river's boxing powers, like the stuffed sack upon which the ambitious prize-fighter at once burnishes his skill and builds up muscle. The sack of course gradually suffers, and would gladly I dare say if it could “hide its diminished head ;” and, to pursue the figure even further, as upon the day of real battle the human antagonist hammered about the head gets shaky about the feet, similarly do thick shrubs suffer when subjected continually to the buffeting of the old river god ; they ultimately give way and tumble over, breaking up from its solidity too the bed on which they stood, and exposing it in fragmentary shape to the force of the invading torrent, which moreover, as the too greedy school-boy, impatiently chews as well as sucks his plum. “I once tried the plan,” one informant said, “and it answered splendidly until one tremendous flood came and swallowed up the whole concern.” What was this but the well-known experience of the ingenious and economical old gentleman who by help of green spectacles had just succeeded in inducing his faithful Dobbin to feed on shavings and fancy it was grass, when the gentle creature died ! The fact is no greater mistake could be made than keep-

ing a plantation on the bank you want to save, in the fond hope that its roots will keep the soil together. The ungrateful little assemblage do nothing of the sort; rather they are in a continual fret to get free, which the savage river by its worrying ultimately helps them to do. The only place in which our piers have failed to "fulfil the promise of their youth" is where the roots and about a foot of the upstanding stem, with its attaching tresses, was left uncleared at the base of the slope; but I am thankful that it was overlooked, for it has taught us an excellent lesson. The "exception proves the rule" is a proverb which is herein borne out.

Gradually we watched the waters burrow round its holding (we were always intending to remove it, but either the boat was not ready when we wanted it or the bill-hook, and so it never got removed, and is now hanging wearily—we can see it in the deep water—waiting until the sinking of the flood shall enable us to sever its surviving claw), and finally a solid mass of the bank, after the old fashion, slipped in to fill the hole. In all other respects, as without exception the most prejudiced have confessed on paying them a visit of inspection, these protective fences have answered admirably. Within them it is surprising what a quantity silts up with every flood—a process which will obviously continue until the accumulation is level with the slope of the piers, and forms one gradual turfed incline, right into the heart of what were before building the deep waters of a salmon pool. Then shall the assailing stream slip over them without let or damage.

I had been long since persuaded of their general exceeding merit, but it has only been during the recent thaw that we have had the structure tested to the uttermost. There has not been such a frost hereabouts for ten years it is said, and when once the ice-locked waters began to move it was a sight to see. For hours, for days and nights, with a seething sloppy sound in one continuous flow the broken-up masses of snow-covered ice continued to move on as it were to the distant looker-on a long band of frosted bridal cake. Past the extremities of our piers the current kept its sweep, and block after block, fragment after fragment, went drifting swiftly by, one just catching the other as it came too near what our young school-boys call "a gentle kick." Sometimes, when there was an obstacle and a stoppage lower down, the bigger members of the shoal dipped under and threw up in affrighted altitude some weaker neighbour right on end, or crushed it within the boiling mass. Still safely and surely they had been shunted off the pier point, until all of a sudden I saw one big stone upon its lower surface tremble. Then taking mean advantage of its fright, under influence of which it had staggered too near the swift outside stream, a young thickset ice-block, about a yard across and a foot deep, hit it something like a blow beneath the ear, which a second ice youngster following up knocked the stone right into the seething abyss. This was not much after all, and so long as its surviving brother pebbles kept a judicious down-charge, as did the Duke's guards at Waterloo, there was no fear of further damage. It was only when a fellow funk and peeped to have a look that he received the retributive blow. The greater masses went contemptuously by, as if in impotent anger, until all of a sudden one monster, taking a dive and thereby mounting upon its back another equally mighty, was enabled maliciously to get a sweep of the shore above the surface of the water, and came thump against our projection, making the whole bank tremble: an alarming effect which was immediately followed up by another triangular block being similarly mounted and brought point on against our precious handywork, this time picking out a boulder which it all but dislodged.

Then another, but I did not dare to wait any longer, as I was powerless to help.

Second period. Having finished one pipe, I took a stroll to see the children skating upon a frozen overflow by the river, and then went, somewhat nervously I am bound to confess, to see what effect the icebergs had finally had upon my jetties. It has been undoubtedly disastrous. Off two at least a foot in height has been knocked off, but not out of reach, and the damage can be easily repaired. From the observations I have taken it is essential that, as soon as fine weather affords the opportunity, the facing next the current should be built with mortar, or else be protected in front by a fence of stakes. At least there should be one stout post at the end to act as buffer against the recurrence of such drifting sledge-hammers. On this subject no more to be said by me, and I trust little to learn. There has been a glorious drift of sand and pebbles within each one of them. Having finished this survey, I went to the homestead to see how the cattle tied up for fattening thrive. It is the only part of the agricultural business that I don't care particularly about, and with respect to which consequently I am perpetually obliged to consult the rules of others. The distinguished M'Combie's rules have helped me most, and I commend, as a kind service to my younger brethren, the following statements, which I have underlined in his little volume to save trouble or reference. As respects the winter treatment of fattening beasts, he observes: "It is indispensable for the improvement of the cattle that they receive their turnips clean, dry, and fresh." He then recommends the storing, if possible, of the whole of the swede crop (I wish we had done so this year), but not the "Aberdeenshire Yellow (only a proportion), as they lose the relish, and cattle prefer them from the field; but I require a proportion of them for calving cows in frost. Frosted turnips make cows with calf abort; and, rather than give calving cows such turnips, I would order them straw and water." This I can endorse as regards sheep too. A few frosted turnips (it was fancied the frost was out of them) were thrown to a ewe flock the other day. During the night one threw her lamb, and had to be removed. The fact is, they give the gripes, and the straining forces out the foetus prematurely. "However faithful in other respects, the cattle-men must have a taste and a strong liking to cattle: they must be their hobby." "Even with men of the greatest experience, the difference in the thriving of the different lots upon the same keep is great. They must not be oppressed with having too many in charge, or the owner will suffer by his ill-judged parsimony. From August till November, a man may take care of thirty cattle very well, or a few more, if the cattle are tied; but when the day gets short, twenty to twenty-five are as many as one man can feed, to do them justice. Good cattle-men are invaluable. They must not only know what to give the cattle, but the great secret, especially when cattle are forced up for show purposes, is to know *what not to give them.*" "When improperly treated" (through having too much turnips injudiciously given), "the cattle scour and hove, the stomach getting deranged. It is a long time before they recover, and some never do well. We generally cure hove by repeated doses of salt, sulphur, and ginger."

"The cattle intended for the great Christmas market" (on swedes since October) "have at first 2lb. to 4lb. of cake a day by the 1st of November. In a week or two I increase the cake to at least 4lb. a day, and give a feed of bruised oats or barley, which I continue up to the 12th or 14th of December, when they leave for the Christmas market." "It is absolutely necessary to increase the quantity of cake and corn weekly to ensure a steady improvement; and if cattle are forced upon cake

and corn over two or three months, it will, in my opinion pay no one."

For the introduction of these extracts I make no apology. I have found the volume, *Cattle and Cattle Breeders*, most interesting and serviceable. I will only add that I have no personal knowledge whatever of

Mr. M'Combie, although he is doubtless well known to most agriculturists through the lovely level black polled heifers he has shown, no less than by the huge bullock which was the wonder of London at a comparatively recent fat show.

THE IRISH LAND ACT.

For many years past it has been a very necessary duty with us to draw, as occasion may offer, the very strongest distinction between English and Irish TENANT RIGHT. There is, indeed, no doubt that the confusion of the two claims has greatly retarded the extension of that principle which we have so long advocated. No man is more sensitive as to the maintenance of his own rights than the landed proprietor, who identifies his position in this way with the exercise of all kinds of privileges, and who grows alarmed so soon as these come under discussion. In this case, however, his terrors have been grounded chiefly on his ignorance. In his neglect to master the subject he has arrayed himself against an unknown enemy, and protested the more, as proportionately less, he comprehended the question. There are hundreds and thousands of landlords in this country who have turned their backs on TENANT RIGHT and driven it from their doors on no better showing than that of the candid gentleman's dislike to Dr. Fell. The reason why he could not tell, but he *did not* like the Doctor.

It has always been very clear to us that the Irish cry was at the bottom of this indefinite dread. Since the day when O'Connell made TENANT RIGHT a war shout people have associated the very name with disaffection and encroachment. The sacred rights of property were to be disturbed, the actual owner was no longer to enjoy the control of his estate, as the mere occupier could keep possession and set the other at defiance. It was counter to some such feeling as this, that Mr. Gladstone broached his Irish Land Bill, a measure which was passed mainly on the understanding that the Irish themselves asked for it, and that the English had nothing to do with it. Still, ably as the difficulty was handled, there was an impression that the Government had gone too far, that it had given too general a recognition to certain peculiar usages and customs. Mr. Sewell Read, in fact, at the last Farmers' Club dinner, said in so many words that "The small tenant farmer of Ireland is not merely going to be paid for every sixpence that he has expended on the soil, but he has also created for him a special interest in the occupation of the land which, although it may in the first instance be to his profit, will, I am quite sure, in the end militate greatly against the interest of the tenantry of Ireland. You can never do a wrong for one class but it must somehow or other eventually recoil upon that class."

According to this the Irish Land Act was doubly a mistake, twice cursed rather than blessed, but the Act is now upon its trial, as its inauguration has been productive of some very noticeable evidence. Cases for the courts have been cropping up all over the country, as we have the reports of some dozen or so before us, while so far the settlement of these has been attended with no very terrible results. On the contrary, the adjustment of one now famous difference between landlord and tenant is altogether encouraging. According to the landlord's own statement of the facts, the tenant on the case being settled by mutual consent "is to receive £850, and, in addition, I forgive the rent due. Had I pressed the case, she would have

got considerably less. The proceedings have only cost about £400, and I shall be no loser, for, as a fine of £500 could easily be got if the farm were let on a thirty-one years' lease at the present rent, it follows that, from a new official occupant, an increased rent will be obtained, equal to about 4 per cent. on the entire outlay." Here it will be seen that the tenant actually receives a larger amount of compensation than the Act would have sanctioned, and still the landlord is amply satisfied. As the concluding sentence of his letter runs, "I feel justified in asserting even from the above exceptional experience that Mr. Gladstone's Land Act is by no means the confiscatory measure some people would fain persuade us." Naturally enough, all the actions have not run off as easily as that of Mrs. Moore against Mr. Macartney. As one of the judges has put it, "the poor frieze-coated man may think he sees fields of gold before him in the Act," and yet the claims have been by no means so preposterous as we had been led to expect. Another lady sets her total of compensation at £81; and, after deducting the year's due, the full amount is allowed. John Morgan asks for £88 in all, and "having so improved his land as to increase its letting value," he was entitled to £80. So far, if not unreasonably, the tenant seems to have the best of it; but the Act would promise to work quite as well for the protection of the landlord. Thus, William Moore, who makes out a long bill compounded of loss of holding, draining, hedging and ditching, subsoiling and drawing mother-earth gets in all £45 instead of £166 17s. 6d., at which he had estimated his "rights." Again, a claim for improvements made more than twenty years since cannot be entertained, and the amount is thus reduced to a mere trifle. Certainly so far we fail to trace any recognition of any unwholesome interest in the land on behalf of the occupier. Naturally a man who paid for good-will when he went in would expect to be paid again when he went out, and this of course often swells the sum to be received; but, if they can afford to do so, the sooner the Irish landlords buy up all such good-will the better for them and their estates, just as allowances for tillages or acts of husbandry should be compounded for in England, as the only effect of such a custom is to lock up and render useless a certain proportion of the tenant's capital.

There is one feature, however, in the Irish Tenant-Right, as exhibited through the Land Courts, that is not so assuring of any ultimate good. Here, in England, if Tenant-Right can mean anything, it must mean permanent improvement or sustained cultivation. If a man systematically reduces the farm again before he leaves it, of course he sacrifices his claim by so doing, or, in other words, takes care to pay himself out. A plaintiff the other day said in his evidence that within the last three or four years he had been taking all he could out of the land, and that he was bound to take as many crops as he liked after his good treatment of the land. This may be in some measure a question of degree, but the admission sounds as if the tenant was *preparing* to leave,

the very thing that the action of the English principle would go to avoid. But, as we said in the outset, the two Rights should be carefully kept apart, as no one yet ever thought of extending the Irish Land Act to England. Nevertheless, as a measure framed to meet a peculiar difficulty it promises at least from so short a trial to be working very satisfactorily. The judges would appear to be in no way embarrassed in interpreting the intention of the several clauses, and the reports of the cases as a rule read clearly and reasonably enough. If there be any feeling of disappointment this will be found, we fancy, chiefly amongst the cottier holders, who have scarcely got as much "Justice" as they had counted on. Their claims are very closely sifted, rather than admitted offhand, as they had probably been led to believe would be the effect of the new law. There were others who, looking at the matter from a different point of view, came very much to the same conclusion, but neither these exaggerated hopes nor fears have been realised. Even in Ireland, *Right* to the tenant does not as now interpreted imply *Wrong* to the landlord, as there can be no question but that many excessive or outrageous demands which might

have been pressed through custom will never be sanctioned by law.

Some few weeks back we gave the address of another Irish landlord, Sir H. Winston Barron, who congratulated his tenantry "on the passing of an Act of Parliament that will give you security of tenure and security for any improvements you may make on your farms. Recollect that whatever money you expend in draining, in buildings, in reclaiming lands, or other improvements, must be by law repaid to you before you can be dispossessed of your holdings. It is therefore clearly your interest to improve your farms. All the profit of the improvements will be for your benefit and that of your children. No one can deprive you of this profit. I, therefore, believe this new law is a good law, both for landlord and tenant." It would really seem according to this that the effect of the new Act would after all be to assimilate the Irish principle more and more with English Right, the essential difference being the sale of the goodwill, for which extraordinary prices have been given within only the last few days.

THE TRURO AGRICULTURAL EXCHANGE.

At the annual dinner, Mr. Pendarves Vivian, M.P., in the chair, the following report from the analytical chemist, Mr. S. T. Rowe, of Redruth, was presented: In compliance with the request of the members of the Exchange that I should furnish a report respecting how far my services have been made use of by the members of the Exchange during the past year, I beg to state that since my appointment in May last numerous communications have been addressed to me by the members, having reference to agricultural matters, some requiring special information, which in every case has been promptly supplied to the best of my ability and judgment. Samples of manures, agricultural salts, soils, and fodder have been received and reported on to Dec. 31, 1870, as follows: 18 of guano, 8 nitrate, 7 soda, 5 dissolved bone, 9 superphosphate of lime, 3 corn manure, 6 sulphate of ammonia, 3 soils, 5 fodder; total 57. It is a matter worthy of remark that during the last six months guano appears to have decreased to a considerable extent with per-centage yield of ammonia. The standard per-centage of this element in Government Peruvian guano has for some years stood at 14 per cent., but for the future I fear such can hardly be maintained or expected. It may afford some satisfaction, however, to learn that what we are losing in ammonia we are to some extent gaining in an increase of phosphates. A knowledge of this fact may serve to prevent much misunderstanding between the merchant and consumer. In Chili saltpetre, or nitrate of soda, there appears a larger amount of foreign matter than in any other manure yet examined. Out of the eight samples analysed two only reached the standard of 94 per cent., one contained 32 per cent. of rock salt, one 30, one 28, one 23, and the lowest 12. In dissolved bone, with one exception, all the samples were of good quality. In the superphosphates five were high-class manures, two moderate, and three extremely low and badly made. The corn manures all contained guano, two having nitrate of soda and common salt mixed, which increased the per-centage of water daily; one sample of fodder was a mixture of chaff, prepared mangold, meal, and salt, hardened into the consistence of soft cheese, and had so far fermented as to become sour and unfit for animal consumption, inasmuch as vegetable acids thus formed tend to a reduction of fat in the animal, and not to the generation of it. Two gentlemen requested to know if a substitute for straw could be found or recommended to be used as litter for cattle and pigs. They were advised by me to obtain bark waste from a tanyard, or use sawdust, both of which being preferable to straw, if the tan or sawdust were sprinkled with a weak solution of oil of vitriol in water, as the oil of vitriol serves to fix the ammonia generated by the decomposition of urine, transforming it into sulphate of ammonia, one of the most active fertilizers known to agriculturists, and it also prevents much of the stench

which is so commonly observed in stables and cow-houses. I beg also to state that in two cases I have been called upon to report on the milk of cows suffering from foot-and-mouth disease. Although these cases were not submitted to me by members of the Truro Agricultural Exchange, they may be of interest to note. In one case, to which I would particularly refer, the milk came from the dairy of a gentleman who had entered into a contract for the daily supply of milk to a large public institution. Assisted by a medical gentleman, a rigid examination of the milk was made under high microscopic power and different lights. Nothing abnormal in the appearance of the fat globules or albumen of the milk could be discovered. In taste, weight, colour, and general condition nothing unusual could be detected which would lead to an inference that the cow was suffering from the effects of a blood poison. The chemical composition of the milk was ascertained with great care, and when compared with the milk taken from a prize Jersey cow in perfect health and condition, with the exception that the latter yielded a little larger percentage of animal fat, but little difference existed. I mention this case in the hope that other gentlemen more competent than myself may be led to further investigate the matter, and not with a view of settling the question as to whether milk taken from a cow suffering from foot-and-mouth disease is fit for human food.

The CHAIRMAN said that last year he recommended them to secure the services of an analytical chemist. At that time he thought he had given birth to a new idea; and though he was flattered to find that his suggestion had been adopted, he found the aphorism "there is nothing new under the sun" confirmed, for in reading over the report of the select committee on the Seeds' Adulteration Bill, 1864, he saw that across the border analytical chemists had been employed by associations since 1859. He would read them some of the evidence given before the committee by Mr. Sharp, a seed-merchant of Lincolnshire, who in question 92 said that the growth of seeds was usually reduced by the trade from 70 to 75 per cent.; and in reply to question 211 he acknowledged that out of £100 worth of turnip seed there would be only £75 worth of good seed, leaving £25 to be accounted for. In question 272, Mr. Sharp said he believed the standard of the generality of the trade to be about 75 per cent. of germinating power, and in question No. 276, that the germinating power of "net" seed was from 90 to 100 per cent. This evidence was confirmed by Mr. F. Kennedy, another seed merchant, who, in reply to questions, said there were two establishments in London where 100 tons of clover seed are doctored every week, and that he believed 15,000 tons of clover seed are sold per annum in the United Kingdom, of which 1,000 to 1,500 tons are doctored. In

question 501, he said, "the farmer need only buy 85lbs. weight of the net to produce the same result as 100lbs. of the adulterated seed." It appeared to him (the speaker) necessary that some parliamentary investigation should take place in this matter. During the sitting of the committee, Dr. S. McAdam, lecturer on chemistry at the Royal College of Surgeons, Edinburgh, and consulting and analytical chemist employed by the Farmers' Analytical Association, was examined. This society was instituted in 1859 for the purpose of testing manures and feeding-stuff, and in 1862 they commenced the examination of seeds. He would explain that by the rules of this association the members were to assess themselves, and the annual rate of assessment was 5s. per 100 acres of arable land, and no farmer was to pay for less than 200 acres, and none for more than 1,200. The rate of assessment was soon reduced, until now it was only 2s. per 100 acres, and the number of members from 60 to 70. Dr. McAdam stated the per centage of live seeds in each kind of plant to be as follows, as a seven years' average:—White clover 72, alsike clover 74, red clover 87, yellow clover 74, and taking the whole during seven years of the clover plants, the average was 76 per cent. In yellow clover the professor said he found as little as 32 per cent. sprouted, and of white clover as high as 96 per cent. In turnip-seed he found the germinating power as low as 27½ per cent. The average of seeds he found to be as follows: Clover 76, cow grass 85, rye grass 75, turnips 72½, sheep parley 40; total average 70 per cent. In connection with this analytical association, when the farmer found that the analysis showed the manure or feeding-stuff is not up to the proper standard, he complains to the dealer or agent, and demands a reduction, or that the material shall be taken back. The effect of this association has been very marked indeed, and the improvement both in the quality of manures, feeding-stuffs, and seeds very decided. The following question was put by the committee: "Has the effect of your Society been really to stamp out adulteration in your district?" The reply was: "It has; we have had only one instance of an inferior manure this year, and no instance of inferior seed." And the cost of this improvement effected by the association had been only 2s. per 100 acres of arable land. He troubled them with these extracts from the report issued by the committee of the House of Commons in order to show them what had been the result of an association that had been in existence but eleven years, and he had presented the secretary of the Exchange with a printed copy of the report. The plan of employing an analytical chemist appeared to him to be exceedingly satisfactory; and though he had not the slightest reason to suppose that the seeds sold in this neighbourhood were not "net," and the manures genuine, yet it was well that the farmers should be in a position to ascertain the actual value of the articles they were purchasing. He thought that this employing an analytical chemist would make merchants exceedingly careful what class of seeds and manures they attempted to sell; certainly there could be no harm in having such scientific investigation, and the cost was exceedingly small. This question he brought before them the previous year, as it struck him, from being concerned in business, that they should not buy seeds or manures without knowing their actual worth; and in this respect agriculturists should be in the same position as those who carried on mercantile or manufacturing businesses.

Mr. OLVER quite concurred with the chairman in his estimate of the importance of chemical analysis to the agriculturist. There was no doubt that manure and food stuffs were largely adulterated, and this they wanted to put a stop to. The growth of this Exchange was a matter of considerable congratulation to the members, yet the society might be made of much more service to the members than it was. Lectures, he thought, should be delivered from time to time on questions of interest to agriculturists. The question of local taxation, he thought, might be left to our Chambers of Agriculture to deal with, but there were many subjects connected with practical agriculture that might be considered with benefit to the members of the Exchange and agriculturists in general. Agriculture he considered one of the most important industrial occupations of any nation, and he should be delighted if he could congratulate the agriculturists of this county on being in a prosperous condition. They were often called "grumblers," but of late they had found out that it did not pay to grumble. For instance, if they had a bad crop it would

not do to make it known to the world, for then the eagle-eyed merchant went to other countries and supplied the deficiency. Thus, when they could no longer get high prices for a small crop, agriculturists found it was opposed to their interests to grumble—they had better give out to the world that they were highly prosperous, when, in fact, the reverse was the case (laughter). The last two or three years had been most disastrous to the farmers of the kingdom; and it was said by well-informed men that during the last three years two years' rent of all the land in England had been sacrificed by the occupier, and this he believed to be the case. The losses of farmers were somewhat peculiar, and could not at once be ascertained. Now, if a commercial man made a bad debt he knew his exact loss at once, but with the farmer the case was different. During the last three years they had suffered from almost unprecedented drought, and the effect of this would be felt for years to come. Last year, for instance, though he kept a farm as well calculated to produce grass as any in the county, he had scarcely grass sufficient to keep his cattle alive, and his grass was worth no more at Michaelmas than at Lady-day. The consequence was, he had to feed his cattle on corn and cake, and their condition was such that he must keep until Lady-day cattle he ought to have been able to dispose of at Michaelmas last. Thousands of sheep were now dying, not from starvation exactly, but from disease brought on from scarcity of food. Cattle were in a similar plight, and some farmers he had met to-day had lost their young cattle in a most unaccountable manner. The fact was, the warmth of last summer kept the cattle alive, but now the cold had set in they became pinched up, and died off. Then there was but little straw last year, and the consequence would be that next year there would be but little manure at command. All these things were of considerable importance, and entailed great losses on agriculturists—losses that were difficult to immediately calculate. The question to which he would direct their attention was the increasing load of taxation. Taxes they had to pay, whether the wind blew high or low. He was sure he expressed the feelings of agriculturists when he said they were ready to pay all legitimate taxes: they wished to see the taxes of the country increase; they wished the army and navy to be properly supported; but they did not want to pay more than their fair shares. They were willing to pay in accordance to the value of the property protected, but they wished that others should pay in the same proportion—in fact, to have fair play and no favour. The landed interest was burdened with too many taxes, and he did not hope for any relief until the landed interest had regained that influence in the House of Commons it had lost, and had become absorbed by the manufacturing classes. The last tax put on them—that of education—was of considerable importance, and some hon. gentlemen were beginning to see that there was truth in the opinions he expressed on this subject the previous year. Mr. Brydges Willyams had stated that he would not vote for a higher rate than one penny in the pound, but he (the speaker) was certain they could not carry out the provisions of the new Act on a rate of 1d. or 2d. in the pound. How was it possible for all the children it was determined to educate to be sent to school and maintained on such a rate? Was it possible for a labouring man with eight or ten children to support and educate them on 10s. or 12s. a week? That was out of the question. With respect to education he thought it possible to educate the children of the lower classes so highly as to do away with their being merely useful members of society, and if a poor lad was educated above his position he was generally excluded by those above him from filling the situation for which he was qualified; and this social jealousy did actual injustice to the lad. But social jealousy did not end here; he had noticed in the *Mark Lane Express* some correspondence having reference to the education of the children of the tenant-farmer class in Herefordshire, and surprise was expressed that they should be so accomplished as to play the piano. But we need not go so far as Herefordshire. He knew an instance within 20 miles of his own residence where a clergyman entered a farmer's house, was quite surprised to see a piano, and ventured to ask if any one in the house could play on the instrument. Surely if such a feeling existed among the upper ten thousand they should be careful how they spent money on the children of the lower classes, or they would be better educated than themselves.

Mr. PENDARVES VIVIAN said: One of the most important measures which had come before Parliament since he had been

a member was the Contagious Diseases (Animals) Act, to which the dreadful scourge of the rinderpest gave rise. Under that Act the country had granted compensation to agriculturists to the extent of £800,000 in money, of which about £250,000 went to the county of Chester alone. The effect of the other clauses of that Bill was, after stamping out the disease, to prevent as far as possible its re-introduction to the country. With that end in view the Privy Council was empowered to stop altogether the importation of cattle from countries which could not produce a clean bill of health, and place limitations upon importations from what might be called suspicious countries. Local authorities were, moreover, enabled to take measures for preventing the spread of the disease, and the transport of cattle was also taken care of. It now only lay with the consumer to demand that the railway companies should feed the cattle during transit, and their demands must be complied with. It was most important to the agriculturist that his cattle should arrive at their destination in good condition, and not in a half-starved and exhausted state. That bill had been conducted through Parliament by the same gentleman who had the conduct of the Education Bill, Mr. Forster, who had on both occasions shown the utmost ability, and disarmed opposition, although he (Mr. Vivian) had felt himself compelled to vote against him more than once. He hoped that if, unhappily, the rinderpest should find its way into the country again, that the power given by the Act of which he had spoken would enable them to stay its progress to a very great extent. The Act also gave power to deal with the scab in sheep and the foot-and-mouth disease, both of which, he was sorry to hear, had made their appearance in the county. The rating of mines had long been a vexed question in Cornwall, but he hoped it would be fairly settled during the ensuing Session, by the bill to be brought in by Mr. Goschen, President of the Poor Law Board.

The CHAIRMAN next gave "The health of the Secretary," Mr. W. H. P. Martin, than whom he had never come across a more efficient secretary.

Mr. MARTIN, the Secretary, read the following :

LIST OF AWARDS.

1ST CLASS FARMS, MAXIMUM POINTS 40.

Names.	Clean.	Fences.	Live stock.	Crops.	Management.	Total.	Prize.
J. Sydney Davey ...	6	7	8	5	7	33	1
Richard Tremaine ...	8	7	7	7	7	36	2
Peter Thomson ...	5	6	7	5	7	30	
G. Mason	5	8	7	7	7	29	
Wm. James	5	6	6	6	6	29	

2ND CLASS FARMS.

Lemon Chellow	8	7	7	8	8	38	1
Wm. H. Hall	8	6	7	8	8	37	2
Joel Manuell	5	5	7	7	7	31	

1ST CLASS ROOTS, MAXIMUM POINTS 32.

Con-

Drilled Clean. Crops. sump- Total Prize
tion.

H. J. Hocking.....	7	8	8	7	30	1
G. Mason.....	7	6	8	7	28	2
Richard Tremaine ...	7	8	7	7	29	
P. Thomson.....	7	7	6	7	27	
J. Trerise.....	7	6	6	7	26	
Wm. James	7	6	6	7	26	
W. Hendy	7	5	6	7	25	
J. S. Davey	8	3	5	8	24	

2ND CLASS ROOTS.

James Hall	6	7	7	7	27	1
Henry Pearce	6	6	7	7	26	2
Simon Chellow.....	8	8	7	7	30	
W. H. Hall	7	8	8	7	30	
C. John Angove	6	6	6	7	25	
Joel Manuell	8	5	6	7	26	

MARTIN AND SON'S PRIZE.

W. H. Hall	8	8	8	7	31	
Simon Chellow.....	8	8	8	7	31	
H. J. Hocking.....	7	8	7	7	29	1
Peter Thomson	7	8	7	7	29	
John Trerise	7	6	6	7	26	
Henry Pearce	6	6	1	7	26	
Wm. Hendy.....	7	5	6	7	25	
J. S. Davey	8	3	5	8	24	

The judges, Messrs. John Magor and John Stephens, read the following note respecting Mr. Thomson's farm. "We were very much pleased at the manner in which Mr. Thomson is cultivating his land, although we could not give him a farm prize. It is only a few years since he took the farm, but during this short time he has laid out a considerable sum in manure, draining, &c., and is deserving of great credit." With regard to Mr. Manuell the judges remarked, "Much of late has been said about the cultivation of waste lands, and Mr. Manuell has, at a very great expense, brought land of the very worst description into cultivation; this has been attended with an enormous amount of labour, which has, no doubt, to some extent, interfered with the management of the remainder of his estate, or he would probably have run the successful competitors more closely." In the third class, Mr. Hall and Mr. Chellow had the highest number of points, but the prize could not be awarded to either of those gentlemen because they had taken a prize in another class, and the rules prevented the competitor taking two prizes.

Mr. MAGOR said the selection of seeds was a very important matter, and the remarks of the chairman upon the point were very valuable. He said he agreed with Mr. Olver in most of his remarks, and went on to point out the great burdens unfairly placed upon agriculture, and advocated a more equal distribution of local taxation. The manufacturer possessed a great advantage over the farmer, for if his business did not pay he could shut it up, whereas the farmer was compelled to go on. He did not altogether agree with Mr. Olver's remarks respecting the Members of Parliament for towns, for he believed agriculturists were often indebted to borough members.

Mr. STEPHENS also responded.

Mr. W. TRETHEWY recommended that a memorial should be sent to the High Sheriff requesting him to call a county meeting, at which the question of local taxation might be fully discussed, and where resolutions might be passed which would greatly strengthen the hands of their representatives in Parliament. He believed it was the county meetings which had been held from the Land's End to John O'Groat's House, which enabled Mr. Gladstone to carry the measure granting compensation for losses by the cattle plague, and he contended that every means of using their strength and obtaining justice should be adopted.

Mr. SYDNEY DAVY, the winner of the first prize cup, spoke in favour of deep cultivation, which ensured drainage in winter and absorption of moisture in summer. A great deal of good manure might be saved by having covered manure sheds at the farm buildings instead of allowing the valuable part of the manure to be washed away by the rain. They would save a third part of their roots by pulping them for both cattle and sheep; and by carrying half home and consuming the other half on the land—pulped—and ploughing in lightly, the land would carry a good crop of clover without any other manure. This course had enabled him to have, notwithstanding the very dry summer, 50 tons of hay to dispose of, whilst he was selling his eleven months' old sheep for 50s. each. Another economy on the farm was to have a place for everything and to keep everything in its place. He advocated the cultivation of waste lands by steam-power, and believed it would pay.

Mr. CHELLEW (St. Agnes), was astonished at a statement made by Mr. Olver to the effect that the competitors would not be much benefited by the prizes. He disputed that altogether, and held that if a man farmed properly, his farm ought to be always in a condition to compete for a prize. He was only a rack renter, but he could not do any more with his land if he were the owner, and he thought it was always to the interest of the occupier to farm in the best manner.

Mr. OLVER said he was of opinion that farms might be farmed too highly to be profitable to the practicable farmer. He did not believe that what was called the garden system would be profitable if applied to a farm.

Mr. CHELLEW disagreed altogether from Mr. Olver. He contended that the nearer they could approach to the garden system the more profitable they would find it.

Mr. OLVER advocated the classification of the prize list, in future, so as to give prizes to tenant farmers in one class, and to have separate classes for owners of land, and for persons who joined other occupations with farming.

Mr. MAGOR said the owner of land had to allow the tenant farmer five points in the competition, which he thought was quite enough.

CHEESE FACTORIES FOR SCOTLAND.

At a public meeting held in the Townhall, Ayr, to take into consideration the propriety of establishing cheese factories in the district, similar to those in operation in America and in some parts of England, the meeting was largely attended by the leading farmers and dairymen of the district.

Mr. MARK J. STEWART, the chairman, said: The subject we have met together to consider to-day is not only one of local interest, but of great national importance. Every year brings with it changes necessary to the various systems of agriculture as practised amongst us, and any of us who can recall the progress made during the last twenty years may readily see how every department of husbandry has advanced. But in order not to be behind in the path of progress, we must watch every attempt to economise labour, as well as the means employed, and bring to still greater perfection what our industry produces. It should be a matter of great consideration whether this cannot be done by uniting the available forces we possess in more systematic co-operation with each other, and, by the introduction of larger combinations of labour and capital, facilitate the object desired. We must not only look at home, but abroad, and ascertain whether results which have proved successful in one country are applicable to another. I need hardly speak to this meeting of the great importance the manufacture of cheese has exercised on the progress of agriculture in this part of Scotland. Not only has benefit accrued to the laird, but the gain has been shared by the tenant as well. Farms suitable for dairy stocks fetch a far higher price in the market than they would have brought before the introduction of the system, and their occupants as a body thrive. Many think, however, that this state of things will not long continue, and there is danger ahead. A cloud has arisen in the western horizon which threatens to overwhelm us. America is doing wonders in her cheese-producing powers. A short time ago her cheese was held of no account in the London market; now it is competing with and outbidding many of our best makes. That this danger is not imaginary, I may mention that the imports of cheese in 1869 amounted to 979,189 cwts., one-half of which came from the United States, which moiety was worth £1,500,000. It may be useful in considering this question to trace its first origin. In 1848, a farmer, with more skill and enterprise than his neighbours, not content with the quantity his own dairy yielded, persuaded some neighbours to send their curd to him to be made into cheese. The curd was weighed, and paid for at a stipulated value, but was found so unequal in quality that the project failed, and the attempt was given up. In 1851, a Mr. Jesse Williams, of Oneida County, New York, a "smart man," as the Americans would say, pre-eminent among his fellow-farmers for his excellent cheese, not only sold his own make but that of his son's, before either lot was manufactured. The son, a beginner, and just starting for himself in a farm, afraid lest his cheese should not come up to the mark, agreed to send his milk daily to his father's dairy, that the cheese might be of equal quality. His example was followed by others, and hence we trace the origin of the first cheese factory in America, and how it was followed up. In 1854 we hear of four factories; in 1860, 17 were established; in 1861, 18; in 1862, 25. From this date, which may be considered the second epoch in the history of associated dairies, we find that private dairies were practically abandoned, and nearly the whole of the milk was sent to the factories. Now mark the rapid development of this system. In 1863, there were 111 new factories; in 1864, 210; and in 1866, it was calculated that the produce of no less than 200,000 cows were passing through the factory process of cheese-making in the State of New York alone. During the past year, 1870, it is said that a sixth more in the total quantity of cheese was made in America, for, besides the factories, in localities where roads were bad and farmers far apart (so that the conveyance of the milk was rendered difficult) many branch factories were set up. Curious enough, the greatest impetus given to this system arose from the rinderpest in England. Hitherto dealers had avoided purchasing American cheese in large quantities, but finding some supplies fail, were driven to buy in a foreign market.

The Americans were not slow to perceive the tide had turned, and from the Dairy Conventions (institutions which I think we might do well to copy), or assemblies of practical men, meeting for the purpose of discussion, agents were sent to England to collect opinions on any practical point as to size, shape, colour, and to study the taste of the British public. We have already noted the success which this unity of purpose gave them. Let us next consider the constitution of the factories, which are of two kinds. The joint-stock factory is where land is bought, buildings erected, plant fixed, shares taken by a number of individuals, a manager appointed by a committee to run the factory, and paid at a fixed rate of wages, or a percentage, and the proceeds divided at the end of the year. The whole produce of milk is sent by each of the farmers having an interest in the concern. The alternative system is that of a limited company, where one or more persons erect a factory, and either buy the milk from the surrounding farmers, or take charge of it, and manufacture it at a fixed price for them. It is important we should consider this management. It is simply that of a co-operative society; a committee meets weekly and supervises the whole process. Each farmer is bound to convey punctually his milk night and morning. This is done in some places by a carrier, or by carting it turn about, and going a round with a waggon; or each carting his own milk on his own account. The cans hold from 125 to 500 gallons each, and great care is taken that they should be quite clean, as through the carelessness of one person a large quantity of milk might be injured. It is not advisable to cart the milk above two miles, though it is frequently brought four or five, but as we have much better roads than in America, the advantage in this respect is on our side. On arriving at the factories the milk is handed up by a windlass and weighed, then run off into vats below—a receipt being given to the carter; and as one gallon of milk is equal to ten pounds weight of milk, which should produce one pound of cheese, the farmer knows pretty well what his cows are doing. The vats are very large, capable of holding about 400 gallons of milk, or whatever may be the daily produce of 100 cows. A most important consideration is a good supply of pure water, not exceeding a temperature of 54 degrees in summer. The whey is either used on the spot for the pigs or sold back (as at the Derby factories, at $\frac{1}{4}$ d or $\frac{3}{4}$ d. per gallon). If fed on the place, each farmer is allowed one pig for every five cows. Many rear calves on the whey, or make it into butter by heating it to a temperature of 180 degs. Acid (or sour whey) is added at the rate of one gallon to every 50 of milk, when the oily matter rises at once and is taken off. About 20lbs. of butter are obtained from 500 gallons of milk. The butter is good for home consumption. It is considered no factory should have less than 300 cows to pay well; from 500 to 800, or not exceeding 1,000 are the most profitable numbers. Remember that nearly the same expense necessary to work a small factory will manage a large one. The American dairymen do not like piling the shelves in their cheese lofts one above another, considering it injurious to the cheese; they prefer building the storehouse very high, with single shelves. It is reckoned there should be one skilled hand to every 400 or 500 cows, and one unskilled hand to every 200 cows. All the hands need not be continued the whole year. I am glad to think the system which I am now putting before you is having a fair trial at Derby and Longford, and, though this is the first season, the result as yet has been most favourable. In the factory at Derby, for 300 cows, two men and one boy are the labour employed; at Longford, for 500 cows, two men and two boys. One is an urban, the other a rural factory—the latter promises to be the most successful. Up to September their cheese had sold at from 80s. to 85s. per cwt. of 120 lbs. The farmers were paid $6\frac{1}{4}$ d. per gallon for their milk, with a share in the profits. Dairymen from America are working it. In Cheshire a tenant-farmer has started, and is working a factory, and says that it has more than realised his expectations. But other countries besides England are adopting this system. Only on Monday I heard that the Russian Govern-

ment had offered £200 for nine months to a young man in one of the Derbyshire factories to go abroad. Sweden, Denmark, and Switzerland are all working at the same system. And now let us consider the principles on which this system is founded. These are economy of labour, saving of capital, and a better article produced; in other words, economy of production and superiority of produce. To examine the first of these advantages, there is, you will observe, a great saving of labour. One man of skilled labour, with two assistants, can manage the produce of 500 cows. Spread these 500 cows over ten farms, and you require ten skilled persons and ten unskilled assistants. There is also a saving in the purchase of material wholesale, such as salt, rennet, annatto, and cheese cloths. Then you are more likely to have the premises in the best possible order and condition, instead of half-fitted-up inferior houses. Factory cheese in America, as a rule, is sold at 10s. per cwt. more than cheese made in private dairies. It may be that these private dairies are probably not of so high a standard as our own. Suppose a dairy of 40 cows, each cow producing 4 cwt., or 480lbs.—this is 8 tons of cheese—say the manufacturing process costs 0½d. per lb., which is above market price—that would come to £37 6s. 8d., but 10s. per cwt. on 8 tons would amount to £80, you would still make £42 13s. 4d., besides saving some £20 in the keep of a servant, that is £62 13s. 4d. clear gain. But observe, if you go into a large concern the expense diminishes. Take a dairy of 800 cows for example, each cow yielding 480lbs., and see what the expense of running the factory would be—

To interest on, say, £1,200 for factory	£70
To materials, salt, rennet, &c.	160
For skilled hands and assistants.....	270
	<hr/>
	£500

This, divided over 800 cows, would show an expense in manufacturing their produce of 12s. 6d. per cow, made a little over 0½d. per lb. on the cheese. Now do not forget there is a further advantage in economy of production, by a great saving of drudging to the farmers' wives and daughters. We are not all big farmers—we cannot all afford bowers, and I think we do not half enough pity our own families. In making cheese in factories there is another great consideration, and that is uniformity in make; and there is greater probability of effecting this in large quantities than in smaller ones. The remaining advantages are superiority in produce and higher prices. I feel confident that the system I am now advocating would be an immense boon to the smaller farmers in particular, who cannot now compete with their larger neighbours in quality or price. If a landlord erected the buildings, and the tenants paid a per-centage, as I have indicated above, the matter, if gone into with unity and a good spirit, and with no jealousy, would be found to pay well. But as every question has its dark side, let us look on the disadvantages of the factory system. First of all it is said, although you can detect watered milk, it is very difficult to do so, even with per cent. hydrometers and lactometers, and a blackguard might by foul play injure a day's make of cheese; then in carrying the milk to the factory it may come turned and sour, or the cans may be dirty. Objections are often taken on the quality of milk varying in different byres. Letters from America tell us that this is not the case—that though there is great difference in individual cows, over a number it is very small—cows well tended and carefully wintered will doubtless give a larger quantity, while the upland herds often yield as good a quality and better. In America it is necessary to make the early and later cheese at home, but I think we should not require to do so. Their factory season begins from 1st to 15th of April and ends 1st to 15th November. Another objection taken is to the greater cleanliness found in private dairies, but of this difficulty I do not think much. There is a danger, however, which may be greater than is apparent at first sight, lest the factory system prove a check to individual energy and exertion, and many may fall below the present standard, and cease to regard cheese-making either as a business or a study. It may be supposed that this system, if adopted, would put down the bowers. I think it would not do this. Farmers know how important it is their cows should be well fed and milked properly—their grieves could not undertake this, and therefore superior men must still be employed, and if 10s. per cwt. were added to their price of cheeses, they would not grudge good

wages to a good man. Remember all these disadvantages, and many more, meet the American farmers, and observe how they are beating us in our own market, and have overcome all difficulties. I shall only say, in conclusion, that in proposing to introduce from another country any new process which appears favourable to our husbandry, we must examine the condition of things in the two countries, and, if different, ascertain whether the difference be favourable or prejudicial. In America we find land is cheap, labour dear, climate has great variations in heat and cold, from which we are exempt; their market is more than 3,000 miles distant, while ours is at hand. My only object in bringing forward this subject is to ventilate the question and promote discussion upon it, and, if deemed advisable, appoint a committee who might go later in the spring and examine for themselves the English factories, and consider whether this system is suitable or not to this country. Recollect, Cheddar, an obscure village, became famous from a few small farmers combining to make large cheese. Let us not be behind hand, but let us unite still to retain our name and reputation as among the first cheese-makers in Scotland. I may mention this is a subject in which I take a deep interest, but it has lately been more directly brought under my notice by Mr. Frederick, of Gass. I trust that he will tell us what he has lately seen at the Derby factories, and that other gentlemen interested in the matter will give us their views on the subject.

Mr. D. FREDERICK said: I must say that I have listened with much pleasure to the able and clear manner in which the Chairman has introduced the factory system of cheese-making. I have long thought of the factory system, but I confess to my having laboured under the false impression that it was impossible to make such fine cheese from carted milk as from milk carried in the usual way to a properly constructed dairy. This, however, was at once dispelled after seeing the appliances for that purpose. In the month of November I visited the Derby Cheese Factory, and it may not be uninteresting to many in this large meeting that I should relate what came under my observation there. Mr. Alderman Roe, who handsomely gave the use of the premises free for one year, with great kindness and courtesy showed me over the factory, and the manager was most obliging in explaining everything as we went along. The carrying of milk is accomplished by means of cans, each about 2½ feet deep by 1½ feet in diameter, having a lid, with an air pipe in centre to descend to any line of milk in it, and thus prevent any shaking of the milk, which is so injurious to it for making fine cheese. Each contributor's milk is emptied from his cans into a large can placed on a weighing machine, and let off through a pipe into the steeping vats, the weight, of course, being registered. The steeping vats are large boxes, about 20 feet long, 4 feet broad, and 20 inches deep, made of wood outside, and tinned inside, having a chamber between for steam or water, as required. They are partly filled with the evening's milk, and for the cooling of which a supply of cold water is allowed to circulate through the chamber, and the overflow is conducted on to a little water-wheel placed in the corner of the apartment, by which it thus makes one revolution per minute, and, by an ingenious, but simple appliance, the milk is gently agitated, to prevent the cream from rising. After the morning's milk is added, rennet is applied in the usual way; but, not to weary you too much, I may tell you that in 26 hours from the adding of the rennet to the milk, the cheese is manufactured, and placed in the store to be matured. I could at once see that, with so many facilities, not only are the operations expedited, but there is economy of labour to a very great degree, whilst an article is produced, although, in my opinion, not equal to some of our crack dairies, decidedly superior to the average of this district. Since being at Derby I had the privilege of a conversation with Mr. Robert M'Adam, who with his family have the management of the milk of 12,000 cows in the United States. He was celebrated, as many present know, for cheese-making in this country. He told me that he had been at the Longford Cheese Factory, in Derbyshire, and considered the cheese made superior to the cheese made in two of the crack dairies of this district. I am convinced that cheese factories would prove a great benefit to the dairy farmers of this district; and although I would use every effort to secure a factory in my district, I could not think of breaking up my present system, provided with a class of bowers as I presently have, but would willingly

contribute my share in the erection of a factory, or in payment of a rent-charge on it. The proprietors at Derby became guarantors to the extent of £5,000 sterling that the farmers should be paid 6½d. per gallon for their milk. I do not think we should ask any such guarantee; but I think the proprietors should erect the factories at six per cent. With this provision, and on our being satisfied with the success of the Derbyshire factories, I think we might go forward without fear of failure. I would suggest that the matter be taken up by such districts where factories are required; that each appoint a committee to visit the Derby factories, to report faithfully to their neighbours, as being the best way of securing the co-operation of all interested; and when a factory is to be established, I think it should not be for fewer than 800 cows, or more than 1,000, which latter number could be had within a radius in most districts here of two miles, which is not the third of the distance that milk is sent to factories. Mr. M'Adam told me that the purest milk was driven seven miles to his factory, and that no attempt at fraud was attempted but in one case, which was at once exposed; the perpetrator was expelled at once, and so disgraced that he had to leave his country.

Mr. CAIRD spoke with great diffidence on the subject, being a learner. But it struck him as obvious, without going into figures, that in a skilled manufacture, such as cheesemaking now is, the larger the scale, the cost of the highest skill, being divided over a heavier produce, will be relatively less per ton than when the work is done on a small scale. The proportional cost of fuel and other items would be similarly diminished. And it is found in nearly all manufactures that those who devote themselves entirely to one department, as in the cheese factory system they would—instead of by turns milking the cows, or feeding them, handling the curd, regulating the hot-pipes, and turning the cheese—soon acquire a dexterity and knowledge which generally produces a superior article at less cost. We had already in this district a considerable number of well-fitted dairy establishments, and the existence of these rather stood in the way of the prompt introduction of the factory system. But he thought it would be no inconsiderable step towards that system if those who had already dairies of some extent, with suitable buildings, where to say to their neighbours who had smaller farms, or who had not the necessary buildings, that they were ready to take in and manufacture their milk on fair terms. For his own part, he would be happy to enter into such an arrangement. But before even that could be done, it would be necessary to obtain information in detail as to the manner in which such arrangements can be worked out in an equitable way, and therefore he recommended the meeting to begin by taking steps to procure and circulate correct and detailed information on the subject.

Mr. SYMINGTON said Sir John Hay had intimated to him his cordial approval of the proposal for establishing the factory system in this country so ably advocated by the chairman, and had authorised him to say that he is ready to offer buildings on his estate for carrying it out in the Glenluce district, if the proposal is to be gone into. He (Mr. Symington) was himself heartily in favour of introducing the system into Wigtonshire. The suggestion just thrown out by Mr. Caird was worthy of their serious consideration, and might be gone into with mutual advantage both to large and small farmers. The introduction of power-loom weaving into our country had superseded hand-loom weaving, and we all know the immense benefit that change had effected on the manufactures and prosperity of the country, although, when first introduced, it was opposed by many upon narrow and erroneous grounds. In like manner, he believed the introduction of the cheese factory system into our county, although it might for some time adversely affect some individuals, would prove an immense advantage to the whole district generally. We would thereby be able, equally with the power-loom factory system, to produce a superior article at a cheaper cost, and compete with the whole world. It was his desire to have their bowers, now a large and important class of men in the district, to whose skill and industry they were all largely indebted, retained amongst them, and he would be sorry if the introduction of cheese factories should be injurious to any of them. He believed, however, that in the end it would not, and that they even, as well as the farmers, would rather be benefitted by the new system. Meantime he would approve of the proposal for obtaining

farther information from those places in England where the system has been introduced, and he thought that they should now form a committee for that purpose, to be so grouped together, from all parts of the district, as to be prepared at a future day to take action in the matter.

Mr. COWAN said he thought the dairy farmers in the Rhins were greatly indebted to Mr. Stewart for having brought before them the system of cheese factories as practised in America and England; and in after years, when they had taken root in the land, the credit would belong to him of having first brought the subject prominently before the cheesemakers of Scotland. He (Mr. Cowan) was of opinion that the factory system would have been received with more favour in the district ten or twelve years ago, before they had been put to so much expense in the erection of new dairies and cheese-rooms, fitted up as they now were with every improvement for carrying out their present system as perfectly as possible. He also believed that factories were calculated to benefit small dairies rather than large, and that in the latter, when skilled makers devoted their whole time to making cheese, as good an article could be made as in a factory, and sold at as high a price. Previous speakers had said they would still require to keep on their bowers or dairymaids. He did not agree with them in that; but if that were so, he did not see that any benefit was to be derived from the factory system by the holders of large dairies, for if they could not economise in skilled labour at home it was uncertain that they would reap any advantage from having their cheese sold out of a factory at a higher price. He then mentioned some difficulties which occurred to him as likely to interfere with the general adoption of the system into the district for some time, but had no doubt these would be overcome, and that if it was decided to try the experiment they might rely on its being as successfully carried out here as elsewhere. He did not wish it to be inferred from anything he had said that he was adverse to the system. On the contrary, he felt inclined to support it, and would like to see a small factory established in some parts of the Rhins during the coming season, but thought that parties who were willing to give their milk for this purpose should have a guarantee from other parties insuring them against loss during the first year.

Mr. BROWN (cheese dealer, Kirkecolm) expressed his approval of the proposal.

Provost INGRAM, following up the remarks of Mr. Cowan, which he said were very practical, offered a suggestion, by way of an experiment, for testing the system in the district. The farmers in a district might send part of their milk to some convenient and suitable building already erected, which might be procured for the purpose, and let the system in this way receive a fair trial. No one could lose very largely by doing this, and after receiving a fair trial the experiment could either be continued or dropped, as might be seen proper. Mr. Symington had intimated Sir John Hay's approval of the system, and his offer to give buildings suitable for a factory. He supposed this offer referred to Bellochjargon Mills, which were, in his opinion, very suitable indeed for making such an experiment as he had suggested, and he thought that offer should be taken advantage of.

The CHAIRMAN, in reference to the difficulties stated by Mr. Cowan, remarked that these difficulties had been felt in America when the system was introduced there, but had all been overcome.

Ex-Provost GUTHRIE had doubts as to the factory system being an advantage to large farmers, but believed it would prove a decided benefit to the smaller farmers in the district, and landlords might advantageously erect a suitable building for enabling these smaller farmers to carry it out. He would meantime suggest that the Chairman's able statement should be published and circulated throughout the district.

Mr. COLE, while cordially approving of the proposal, spoke of the great disadvantage the farmers of Wigtonshire had, as compared with those in Somersetshire and Cheshire, in regard to natural grasses.

A committee was then appointed for obtaining the information referred to, and to report to another meeting, consisting of Messrs. D. Frederick, A. M'Neil Caird, G. Symington, J. M'Master, Culhorn Mains, Brown, Kirkecolm, and others, with power to add to their number.

Mr. SYMINGTON moved a vote of thanks to the Chairman for presiding and for his able speech.

THE SHROPSHIRE CHAMBER OF AGRICULTURE.

At the annual dinner, the Earl of Powis in the chair, the attendance was not so large as on previous occasions. The Rev. C. F. C. Pigot said he believed next year they would see a larger number of the clergy present, for they would find that the Chamber dealt with many questions closely connected with the efficiency of their work, and the social condition of the labourer, the education of his children, the improvement of his dwelling; and there was also a question in which they had a pecuniary interest, to which the Chamber was about to devote its energies, viz., the important question of Local Taxation. It was singular that this subject of local taxation had not yet awoken any great interest in the landed proprietors, especially as they invariably met any appeal which had a claim on them not only with liberality, but with great munificence. Yet it was easy to see how deeply they were affected by the present system. The justices of twenty-eight counties in Quarter Sessions had just sent up petitions to the House of Commons or the Home Secretary. The other counties would no doubt follow. The great towns, too, were moving in the matter—Liverpool, Manchester, and Leeds. There was no divergence between town and country in this matter. The towns would be their warmest allies. Indeed, they were the greatest sufferers, for house property amounted to sixty-five millions, and land to only fifty-five millions of that property which alone was liable to local rates; and while the agriculturists escaped with 2s. or 2s. 6d. in the pound, the towns paid four and five and six shillings and more. We could already rely pretty much on the support of the county representatives, when this matter comes before the House next session; and as soon as the borough voter understood clearly (and we must enlighten him) that the rates which made him lose his temper regularly once a quarter were levied on only about one-seventh of the whole wealth of the country, we should soon see the borough members supporting the county members in claiming the redress of this grievance.

Col. CORBETT, M.P., said: In years gone by I had an intimate knowledge of the whole county of Shropshire and those in it, and I believe there is hardly a field I have not been in, or a hedge I have not broken or got clean over. Two or three agricultural measures occupied our time in Parliament since our last meeting at this festive board. We had a short scurry upon our old friend the Malt-tax; but, as usual, he beat us at last. However, I hope that by patience and perseverance we yet may manage some day to pull him down. With regard to local taxation, I hope that is in a more hopeful state; it has been uppermost in all our thoughts, and has received a great deal of attention. The Government have also promised to deal with it, though I must say they don't appear in any great hurry to do so. However, it is a question which is pressing like a nightmare on our chests, and must sooner or later be settled on some fairer basis. There is another question which, as I think it concerns many of those in this room, I will with your permission allude to: it is the subject much in people's thoughts at present—that of education. Those who have read the reports of the commissioners to inquire into endowed schools will be aware that there are a considerable number of schools in this county with small endowments, which in years gone by have done more good and been in a more prosperous state than they are at present. Well, now I think that those endowments might fairly be applied in giving a better education to farmers' and tradesmen's sons than they now get. The new Elementary Education Act will no doubt have the effect of improving the education of the labouring classes, and it is highly desirable that the education of the middle classes should keep pace with them; and perhaps it might be well if, after the manner of the county of Devon, a committee of five persons, well qualified for the work, were appointed to consider with the commissioners under the Endowed Schools Act as to the best manner of utilizing these endowments. There is just one other subject which has very lately come to my knowledge; but as it is one of considerable interest to both landlords and tenants, I will venture to occupy your time for two or three minutes. Well, gentlemen, I heard the other day of a case which occurred, not in this county, of a claim being

made of an increase of 20 per cent. in the income tax on a farm, only because there had been no new occupancy or new agreement for seven years, and this claim was made and substantiated on the ground that the value of the land had increased 20 per cent. in that time. Now an increase of 20 per cent. in seven years represents an increase of 100 per cent. in 35 years, and I ask the farmers here present if they consider that their farms do double their value in that time? This appears to me to be a question touching both landlord and tenant, and as far as the prosperity of agriculture is concerned one is synonymous for the other, and thus it is a question well worthy the consideration of Chambers of Agriculture.

Mr. FEGGINS, M.P., said: I feel that justice was not fairly meted to the agriculturists last session in the reduction of imperial taxation. Malt would have been a better reduction than sugar; but now it is hopeless to look for reductions. There will be an increase rather than a diminution of taxation, and I am sure no class in the country will more readily concur in supporting at any sacrifice the honour and dignity of the country than the British farmer. No doubt legislation will tend early in the direction of the withdrawal of children's labour. Then comes the question, Can the labourer afford to lose the product of the children's work? I doubt not. The consequence would be that the parents' wages must rise. But this involves the next question, Can the farmer afford the necessary rise? I fear not, looking at the limited profits of agriculture. Well then, who must bear it? I think the landlord; but only for a limited period; for, in this advancing age, agriculture, like manufactures and commerce, is susceptible of the advantages to be derived from increased intelligence in the masses. One of the subjects for early legislation is the licensing question. While it would be most unjust to shut up houses in which tenants have invested their whole substance in the faith of existing laws, and utterly ruin them, it is possible to regulate the traffic in intoxicating liquors by reducing the number of houses in which people are allowed "to be drunk on the premises," and compel the liquor to be sold over the counter, and taken away. This course would take away much of the temptation to tipples, and prevent those pernicious assemblies where poaching and other crimes are concocted by the bad characters in the district. Great good would, I conceive, be accomplished by abolishing the prevalent practice of paying part wages in beer. In an adjoining county the allowance is four pints of ale and eight pints of beer, and in Suffolk it is five pints of ale and small beer unlimited. Whether in this case it would extend beyond the twelve pints I know not; nor do I know the quality of the small beer, but would it not be better to pay for both, great and small, in money, and leave the man to do as he pleases? He might not spend it all in beer, and probably would enjoy some of it with his family at home. The labourers' homes have been alluded to, but I doubt if any great improvement will take place while the question is only considered as one of philanthropy. The important point is to discover how improved dwellings can be carried out as a fair and reasonable investment; and as in agricultural districts the price of the land would not form any appreciable amount of the rent, I believe it may be done so as to let greatly improved cottages at 1s. 6d. to 2s. a week. I trust there will be no necessity for legislation on the question of game. I have such reliance on the good feeling of the landed proprietors that I am confident, as a body, they will do what is right and consistent with the spirit of the age; and I think the tenant would never desire to shut out his landlord in the fair pursuit of game. But the system of letting shooting to strangers from London and the other large towns is very objectionable, as they have no sympathy with the tenant, and care only to fill their bags, regardless of every inconvenience or injury. There is one more subject upon which I wish to say a few words. There has recently sprung up a cry for reciprocity, or protection to native industry. Now, there could be no objection to inquiry into the whole subject of free trade; but this is not what is asked by the advocates of inquiry, for at all meetings on the subject the question of food is ignored, and the pro-

gramme is that Coventry weavers are to eat Shropshire bread wholly untaxed; but when Shropshire farmers and the inhabitants of Shrewsbury, depending upon agriculture, desire to decorate their wives and daughters in silks and ribbons they are to pay to Coventry weavers an enhanced price by means of protective duties. This would not be justice. Certainly, it would not be reciprocity. No, if protective duties are to be again imposed, they must be upon all industries; and where is the statesman who would re-impose a tax upon the people's food? The farmers now gracefully bowed to free trade, and I would advise manufacturers to look upon it as an accomplished fact, and have faith in their industry and energy.

Mr. BOWEN JONES said I think it cannot be wondered at if I rejoice in the success that has attended our efforts, and that I feel satisfaction in the fact of our Chamber of Agriculture having progressed to its present position, and having so fully answered the expectations of its promoters. And, perhaps, I shall not be altogether out of place, if I advert shortly to our proceedings in the past; but I would here say to those critics who continually cavil at farmers succeeding in nothing they undertake, that a fair review ought to satisfy them that our organization has accomplished some, and gone far to advance the other different objects we have had in view. Impatient and ignorant men think that the power we possess should be so great that we have only to ask for a particular privilege from the House of Commons to have it, and conclude that if we don't get it at once we are of no use. Those who take the trouble to work out matters that affect our interest, know that they must first of all make a good case and prove an injustice, but they know perfectly well, also, that we have been heretofore so far in the background that such associations as ours merely put us upon an equality with similar institutions in commerce, that have been labouring patiently for many years, that have not only got the start of us, but have secured more unity than we have as yet acquired, unity not only of person, but of that other necessity for successful action in any undertaking, unity of purse; also, that as a rule, they have used more application than those connected with the land have as yet as a body. What is the consequence? During the past fifteen years the interests they represent have secured a reduction of imperial taxation to the extent of many million pounds, while agriculture has had no concessions made her, and consequently, as other interests have had taxes remitted, and we have received nothing, we have been actually burdened in adverse ratio to their remissions. Well, we have taken in hand since our formation the following subjects, viz.: In the past half-year, The Over-preservation of Ground Game and Compensation for Unexhausted Improvements; and before that time, The Foreign Cattle Question, The Malt Tax, The Abolition of Turnpike Gates, Local Taxation, Education of the Labouring Classes, Weights and Measures, and a variety of other work, such for instance as the attempt made to induce the Royal Agricultural Society of England to visit Shrewsbury this year, and other business of a detail character, and I have no hesitation in saying that on most of these questions a better understanding exists, and that the discussions of some of them, which have been questions between landlord and tenant, have been conducted in such a way as to remove any impression that the farmers of this county want to insist on anything more than what is fair and reasonable for the successful occupation of their land and its improvement. Such questions as game and Tenant-Right must be dealt with before agriculture can expand to its full extent, and it is better for landlords and tenants to discuss such matters openly and dispassionately together (for there is more than one side to them), than for ill-will, distrust, and failure to attend the evil practice of over-preservation of game, or to succeed the bad farming that is fostered by the custom of holding land with a six month's notice to quit, without any proper agreement or compensation clauses. This is not the place to enter into a discussion on them, but I would remark, as a tenant farmer, that I consider such questions must be looked into with a view to secure the landlord from damage as well as the tenants from loss; and I say for myself, and proclaim it too on behalf of this Chamber of Agriculture, that I do not wish to wrest power and privileges from one class only to confer it on another. What I ardently wish for, and what I will devotedly work for, is to remove all the trammels that now bend down agriculture and prevent her progress and development. When her fetters are

struck off, and I trust I may live to see the day, not only will the three classes most directly interested in the land—viz. the land owner, the tenant farmer, and the labourer—be benefitted but the community at large also. With regard to the foreign, cattle question, our organization has almost entirely to be thanked for the efficient arrangements now carried out, and if they are only extended a little further they will be entirely satisfactory to us. With the malt-tax we have not done much the present Chancellor of the Exchequer's Barley Sprouting Bill, and Mr. Gladstone's Malt for Cattle Bill, being the only concessions made. I have not myself tried either, but I don't think we shall derive much benefit from them. This subject has been well ventilated and is thoroughly understood; it is a question that only wants deciding by action in the House of Commons. Most of our other debates have been on matters more or less dependant on the great question which at present occupies our minds, which we must continue to agitate and press upon the attention of our members—I mean the great question of Local Taxation. Thus the abolition of turnpike gates now throws the burden of the maintenance of the roads upon the parishes they run through, or I believe from about this date, on the highway districts—that is to say, the ratepayers, or, in other words, to the greatest extent, the tenant farmers will, as the law now stands, have to pay for their being kept up. The education rate, where required, by the new Act is levied on the basis of the rateable value of the parish also, so here the farmer has to pay again. These matters, therefore, are greatly influenced by the fairness or otherwise of the incidence of local taxation. And how do we stand in this respect? It is not necessary for me now to go deeply into the question, as it has already been considerably touched upon. I will merely, therefore, allude to it by stating the figures given in a recent return. In 1868, £16,783,000 was raised upon the rateable value of land and houses, which amounted to about £100,000,000. Property tax was paid upon a sum of about £300,000,000. Therefore one-third of the wealth of the country paid, two-thirds escaped. Since the year 1837 the burden of local tax has doubled. Over eleven millions, out of the sixteen levied in 1868, are used for imperial purposes, such as militia, keeping of lunatics, police, &c. These are rather startling figures, and as the proportionate payments of real property are yearly increasing, it behoves us to be up and doing.

Mr. MORE referred to one of the officials of the Central Chamber having started a publication, and said they were probably aware that the Central Chamber had been considerably criticised by the agricultural press during the past year. The Central Chamber was ready to profit by suggestions, that when it found six provincial Chambers of opinion that its constitution could be amended, it appointed representatives of those six Chambers to confer with five of its own on the reform of its constitution. He ventured to think it would be better in the future for the Central Chamber to hold more meetings for business and fewer for discussion, and that the district Chambers should send as delegates members who were sent to represent them long enough to become used to the rules of debate. He had carried a new rule that the March meeting should extend over a couple of days, the object of which was to enable members of any deputation that might visit a minister plenty of time to concur amongst themselves as to the arguments to be used before him. When the farmers went to Mr. Lowe on the malt tax they had notice at eleven of the same day that the Chancellor of the Exchequer would receive them at two, and they made an impression on Mr. Lowe, who received them more favourably than any minister had done before. The Central Chamber was merely a means to an end, an agent between the country chambers and the House of Commons, in which, chiefly as their late president, Mr. Tomline, had so often said, they must work for carrying their measures. But a Central Chamber ought, in his opinion, to be conducive to that unity of feeling so difficult to obtain among agriculturists, who were often unduly impressed with the requirements of their own particular locality. He would venture to say, even before a Chamber which he believed felt less interest in the question [than any he could address, that he believed the introduction of the representative element in county business the most important question, and the one most likely to soon pass into law of any the Chambers had ever taken up. He would briefly allude to this question, because attention had been lately called to it

by a magistrate of great experience in poor law, who proposed in Montgomeryshire to petition Parliament against the representation of ratepayers in county business on the ground that they could not make magistrates more economical. Proceeding to local taxation, he was not surprised that the increase of rates made people look for their relief by increased grants, or by their being spread over a larger area for collection. But he could venture to recommend them to master the subject rather than to suggest a remedy. He would advise them to consider well the general remarks made on the subject. One important one was made by the present Prime Minister when Chancellor of the Exchequer, before he was in Parliament, but he was surprised that no one had criticised such an important remark. Mr. Gladstone said that landed property had doubled in value since the repeal of the Corn Laws. That was perfectly true, but it has by no means generally doubled in value. In fact the duplicate was chiefly composed of property near towns, and there were many parts of Shropshire that had hardly increased in value at all. On the other hand it was quite fallacious to represent the increase of rates as falling on all land equally, for by a recent return it appeared that the incidence of local taxation was 16 per cent. on rental in the metropolis, of which the hon. member for Shrewsbury (Mr. Figgins) had spoken, 20 per cent. in cities and boroughs, and only 11 per cent. in counties. He mentioned these facts to show how much consideration the whole question required. Mr. Dudley Baxter, an eminent Conservative, was reading a paper that night in London on the incidence of taxation. He had published a book on the subject, in which his conclusion was that ratepayers were prone to consider the taxes that affected themselves apart from general taxation. If landlords and farmers were struck with the burdens on land, holders of general property were equally impressed with the grievances of the legacy and probate duty. He advised them to consider taxation as a whole, in which he (Mr. More) concurred. But it was clear that the education of farmers' sons must go beyond the village schools: the education was necessary if they were to enter into those difficult questions. Mr. Figgins thought it most objectionable to rent-shooting, but he would venture to say the farmers, much as they disliked the practice, would make exception in his favour if he rented shooting as a London citizen in the neighbourhood of Shrewsbury. Should he have any conscientious scruples in doing so, he thought they would best be allayed by his following the example of other game-preservers in the county by sending his game next year to the dinner of the Chamber of Agriculture (much laughter).

Mr. ATCHERLEY said: I am afraid it is a habit to expect too much from Chambers of Agriculture. I am aware as to legislation their results are *nil*. That great question, the repeal of the malt-tax, has not yet been carried, and I venture to repeat the language I made use of at the first annual meeting of this chamber, four or five years ago, that it never will be, until taken up as a national question. With regard also to county financial boards, after having been recommended by a committee of the House of Commons; after having formed part of the pledges of members to their constituents; after having been prepared for by most counties, it seems fairly to have gone to sleep, and when it will emerge from the realms of Morpheus seems very doubtful. With respect to the question of local taxation, we have the valuable assistance of the courts of quarter sessions. I wish a satisfactory measure was passed on the question of game. We have been more successful in the Contagious Diseases Act; in the metropolis the plan of separate markets and quarantine was carried out.

Mr. EVAN DAVIES said the day may arrive when we shall be shut up in our island home wholly dependent on our home supply for feeding our people. I am old enough to remember when it was so, when wheat sold at 32s. per bushel, and beef and mutton 1s. per lb., and that too at a time when our population was little more than one-third what it is now, and what has been may be so again. It, therefore, behoves all connected with this question to inquire what stops there are in the way to prevent the full capabilities of the soil being brought into action, and I, as an old farmer, am bound to say there are many. Let me therefore beg of you to see to it; remodel your system of letting your farms; remove all restrictions on the energy of your tenants; annihilate the vermin which now destroy and deface their crops; give them a good and liberal scheme of compensation for unexhausted improvements, and

do away with the obnoxious system of six months' notice to quit; don't let your farms to men you have no confidence in, and when you have made the selection give them free liberty of action; if they are worth having they will best know how to cultivate their farms. I was forcibly struck the other day in reading a letter in the public prints from a Scotchman of Fife, and, as it was addressed to the chairman and members of Chambers of Agriculture, it is the common property of us all: it was on the home-grown food. The writer goes on to show that all we produced last year, with all we imported, fell short one-third of a health-supporting supply, supposing the food had been equally distributed to all; and he also showed that by a better system of agriculture Great Britain might not only become independent of a foreign supply, but also make provision for an increase of 3,000,000 to our present population. I will not weary you by repeating all the statistics by which this writer arrives at his conclusions. I will mention two of them. He says by a better system of cropping an increase of home-grown food in money value, amounting to £183,100,000, might be obtained, and by the abolition of the Game Laws £10,000,000; and Mr. Mechi, in his admirable essay (as read at the London Farmers' Club) on the Undeveloped Resources of Dry Land, says that the home supply might be doubled; and I am not at all disposed to doubt the assertions of these gentlemen. I daily look upon a large estate in front of my house that is a complete wilderness of waste, which does not produce a sufficiency of food for the people that live, or ought to live, upon it. Another large estate in my neighbourhood, is become in such bad odour from formerly being overrun with ground game, and from the exaction of excessive rents, that none but hand-to-mouth tenants will seek occupation upon it, its cultivation being miserable, and I have no hesitation in saying that three farms of 400 and 500 acres, adjoining these estates, produce more food for the people than four times the acreage of these impoverished estates; and is this to be tolerated with our fast increasing population? Are we to continue to send our best labourers abroad to enhance the power of the foreigner, to increase his supply to compete with us in our markets, instead of employing those labourers at home, and thereby increase our own supply? Are we to continue to send our gold abroad to enrich the foreign farmer, instead of ramifying that gold through our own labourer, and thereby enrich ourselves? No doubt the owners of these impoverished estates say they have a right to do as they like with their own. Government has thought differently in Ireland, and if our home supply should fail to keep pace with our population, and the foreign supply crippled by the gigantic war now raging and others looming in the distance, Government may take it into their mind to inquire if there are any obstacles to an increased home supply, and they will have ample evidence to prove that great obstacles do exist. The want of security checks the flow of capital, restrictions as to cropping incompatible with energetic action, the food of the people destroyed by vermin, and the cultivators weighed down by an undue share of local and imperial taxation, these and numerous others will prove that the time has arrived for legislative interference, and the cry of doing as I like with my own will be no longer tenable. I hope, my lord and gentlemen, I have kept within the bounds of fair discussion. I can have no other object in view but that of creating a necessity for enlargement of your pockets as well as our own; but before I sit down I will give you a homely illustration of this doing as I like with my own. Take a labourer, for instance, with a good garden, which he refuses to cultivate, and allows it to be overrun with weeds, and contents himself by buying his vegetables and fruit from his neighbours. You remonstrate with this man; he tells you he has a right to act as he likes. Just so; but I think you would tell that man that he was not only unwise, but unjust to his family; and if landlords forbid their tenants to plough within a yard of the hedge to have a cover for game; if they forbid the use of the reaping machine in order to have a covey for partridges; if they neglect to carry out the permanent improvements on their land, and refuse to give their tenants security to do so, their landlords may say they have a right to do as they like; but depend upon it the people will say what you said of the labourer, that such landlords are not only unwise, but unjust to their families, and traitors to their country.

NEWBURY FARMERS' CLUB.

At the monthly meeting, Mr. S. Wentworth in the chair, the following Paper was read by Mr. HENRY FRAMPTON, of Waterhip, on "British Agriculture: the Present Position of the Tenant Farmer."

In introducing this deep and fertile subject, I would first remark that it is not my intention to take more than a cursory view of the different points brought forward. The opinions I advance I offer as my own only, leaving it to those practical gentlemen I see present to correct and amend. I intend to refer to no special individual case, but take the whole collectively. My remarks will apply more particularly to those districts with which I am acquainted and can speak from experience, namely, Berks and the surrounding counties. To come then at once to our subject, "British Agriculture." What is it? I reply—The backbone of our country, a great and noble reality, well worthy the untiring energies and zeal of its disciples, because never exhausted, and always capable of continual and extended development. Let us then consider what are the principal impediments or hindrances to a full development of the agricultural resources of this country. I take the following to be amongst them: 1st, Insecurity of tenure; 2nd, Absence of a just and equitable system of Tenant-Right, which would include compensation for unexhausted improvements; 3, Illiberal and unnecessarily restrictive covenants; 4th, Undue burdens upon land in shape of rent, labour, and taxation (including rates); 5th, Over-preservation of game and rabbits; 6th, Insufficiency of cottage accommodation and suitable farm buildings; 7th, Competition with all the world upon an unfair basis; 8th, Insufficiency of capital; 9th, An unjust and inequitable payment of wages. 1st. "Insecurity of tenure." By it I mean liability to be turned out at any time, either from the death of the landlord, the tenant's death, or any other cause; in the second event would be included the widow's (if any) liability. It is evident to all that this insecurity acts as a great check to the application of capital to the soil, unless there is some redeeming feature, and that all who study their own interest will not invest more capital than is really necessary on the land; consequently it is not so productive, and there is not the return there might and ought to be. This difficulty is best met, in my opinion, by a good lease, or by "a just and equitable system of Tenant-Right which would include compensation for unexhausted improvements." Then capital may be invested on land with far more safety than otherwise; and surely it is the bounden duty of the farmer, who has others dependent on him, to see that his capital is invested with security. The next point I consider a great hindrance to the farmer, namely, "Illiberal and unnecessarily restrictive covenants." As the interest of both landlord and tenant ought to be one and the same, so I cannot but believe these are disadvantageous to both, and that it would be to their mutual interest to abolish them. With the necessary restrictions and conditions at the end of a term, what else is required, excepting that the land shall be farmed according to the rules of good husbandry? I feel satisfied landlords would be no losers, but rather gainers, as land would generally be farmed well and left in far better condition than it is now. What a fallacy is that now existing in so many covenants—"and will not sell hay," "and will not sell straw," &c., when the manorial refuse of either of these is, I believe, 30s. per ton, whereas that of either maltdust, or cake, or about beans is about 75s.; a benefit of something like 150 per cent. to the land! Why if he (the tenant) were allowed to sell such by bringing back an equivalent (which he would be compelled in self-interest to do) the land would be trebly benefited. Again, look at that absurd restriction, "and shall not seed vetches;" why, if that is carried out, the tenant will seed peas, beans, or something else instead, and often much to the detriment of the land; for many a farmer plants an extra field of vetches on land in good trim, to feed in case he should be short of keep, and if not to seed, and more often it is fed than not; there are many such-like unnecessary and useless restric-

tions; the time is come for such to be swept away. 4th. "Undue burdens upon land in the shape of rent, labour, and taxation. It is generally acknowledged that land is now let at more than its value in many instances, and why is it? Simply because the demand is greater than the supply. We can not much wonder, under such circumstances, at landlords requiring a high rent; still, if they know the value of their land, I question the policy of fixing the rental at more than it is worth. Labour, with the farmer, is an ever-increasing item that cannot be stemmed, neither is it the wish of employers to beat down labour, provided they can get "a fair day's work for a fair day's pay;" but as a rule they cannot. Labour is, to a great extent, "eye-service," and therefore very dear. This is partly accounted for, I believe, by the unsatisfactory system in vogue of paying men by the day, or like, instead of what they are worth. There is another light whereby we may look on this labour question, namely, if the employer has to pay 75 per cent. in rent and taxation, there can be only 25 per cent. left for the labour. I don't mean that these figures shall represent the exact case, but only use them as a similitude. Now for our friend "Taxation"—taxation of all kinds, local to mind and pocket! year after year increasing, and most likely continuing to do so. I cannot wonder at our poor-rate increasing, for if we are not "educating" people to be paupers, I know little about it. Burdened as land already is, yet additional burdens are now threatened; a considerable education-rate stares us in the face, and how is it to be paid? is probably a question with many. I do not object to all fair legitimate taxation, provided all stand upon a fair footing, and all property is made to bear its fair share in the taxation of the country; but, alas! it does not. I hope the time, through the efforts of Sir Massey Lopes and others, is not far distant when it may be made to do so. While on this subject, I cannot help remarking on what I consider to be a most unjust thing in connection with taxation, namely, the bearing of all game prosecutions, commitments, and maintenance by the country. Gentlemen who preserve game can afford to protect it in every way. If a poor man loses his pig or what not, he must bear all expenses attending the prosecution; surely this is not justice. The police are also now, to a certain extent, gamekeepers. By the (5th) over-preservation of game and rabbits, temptation is placed in the way of the poacher at the expense of the ratepayers. No man ought to take a game farm—by this I mean excessively preserved—with the idea of making a profit, for, whatever the rental, it cannot be cheap. Many a broken spirit, and many a ruined family now mourn the effects of it; people do not know what it is till they try it. What bitter feelings has it raised and engendered, and what evils has it been productive of! Let gentlemen preserve their game by all means, if they please, but let them bear all the expense of preserving and maintaining it. 6th.—Insufficiency of cottage accommodation and suitable farm buildings. That these are very important requisites to the farmers, and that there is great lack of them, none, I think, will deny; even landlords themselves admit it, but unfortunately, in many instances, there it ends. As a rule, feeling the great and absolute necessity there is for both cottages and good suitable buildings on a farm, tenants will generally, I think, be found willing to meet their landlords in this matter, and pay a fair per centage upon all capital judiciously expended in these improvements, to carry on a farm both profitably and comfortably, some cottages are an absolute necessity; where there is an insufficiency, greater recourse must be had to the hiring or "cot" system, by which I mean the collecting together of single servants—young men and boys—into a single cottage; this is not a satisfactory system, and the bringing together of several young heads, without much control or supervision, is often productive of evil; if most are steady and respectable, too often there is a "scabby sheep" among the flock, and then we can imagine the effects of his influence upon the others. Further comment from me

on this subject is unnecessary, for it has often been brought forward by more able hands than mine—by Mr. Darke and our Chairman especially—and long may we hear them continue fearlessly to press upon landlords the necessity of listening to this matter. 7th. Competition with all the world upon an unfair basis. This does not require many words from me. I do not object to free trade in the least, provided it is free. Till the malt-tax is repealed this will not be; no country can compete with Great Britain in barley, yet here is one of our great cereal productions hampered with an excise restriction of about 70 per cent. The last one shilling duty has been taken off foreign corn, so that now the foreigner can compete with us who maintain the revenue, without paying one farthing towards it, and not only that, but he also draws a considerable amount from our coffers for foreign lands—very probably a portion of it is returned expended in the manufactured productions of this country. 8th. "Insufficiency of capital," and consequently not master of his position, is an injury to the farmer. The sound and idea of a large tract of land for little money is perhaps rather tempting, but as a rule that is the land that requires capital; it is not sufficiently good in itself, and too much has been taken out of it to yield any quick or fair return. How many a farmer finds this to his cost, and wishes that he had taken only so much land as he could well manage. If many farmers would employ the capital they now do upon considerably less land, would they not be gainers? As, at present, they are compelled to go on, and are never in a position to take advantage of the markets and times. On an estate known to most of us this is more and more apparent. Tenants come and take a large tract of land with little capital, they find they are deceived, get what they can out of the land, and "hook it," each one leaving it poorer than before, and being in that plight himself. Continual changes occur. I venture to say that if the owner would grant liberal and unrestrictive leases at a rent, keep down the game, and make it worth a good tenant's while to stop, he would ultimately be a great gainer. 9th. "An equitable payment of wages." By this I mean a system of paying men according to their worth, thereby causing and arousing a spirit of emulation and striving in them. Our present system does just the reverse, and tends to drag all downwards. A good labourer is always worth his hire to the employer; but how dear is a bad one! I cannot but think we make a rod to our own backs in the way we now pay our labourers. How is it to be altered I cannot see. Individually we cannot do it, collectively it is a great undertaking. Labour is very costly to the farmer, and to make it profitable we want it good. I am inclined to think we are not sufficiently well educated in the scientific part of agriculture for us to reap the full advantage. If such then are some of the hindrances and drawbacks to a full development of the agricultural resources of this country, the remedies must lie in the opposite or correcting of those hindrances. Let the landlords look out for enterprising tenants, with sufficient capital at command for the land they wish to occupy; and having secured them, grant liberal leases, with no unnecessary restrictions at a fair rental. I say leases, because I do not think anything else can take their place, for these reasons: Every man is but man, death or other changes may take place at any time. If a good tenant enters upon a farm he does so with the intention of remaining there for some years, and therefore it is necessary that he should not fear any change that may occur, but may lay out his capital upon the land without risk, if judiciously applied. In those cases where a tenant or his ancestors has been renting the same farm for many years, and may rest in security of justice being done, or when leases have run out, and a good understanding between landlord and tenant has arisen, leases may not be a necessity, they are rather supplemental cases; but in all general cases leases, if properly managed on both sides, are, I believe, a mutual advantage. After granting fair and liberal leases landlords must be prepared to erect all necessary good farm buildings and requisite cottages upon such terms as shall be agreed upon. I am inclined to think if all farms were let at a round sum, exclusive of rates and taxes (except assessed and income), it would work advantageously to all parties. In the "Agricultural Labourer" I find the following quotation from Pro-

fessor Buckman: "Suppose a landlord has money in the funds, and takes £1,000 out to improve his cottage property, he pays no poor rate so long as it remains in the funds, but as soon as he invests it in cottages the poor rates are 10 to 12 per cent. But if poor rates were properly arranged, so that all property should bear its fair proportion, 2½ to 3½ per cent. instead of 12 would cover the whole;" and he goes on to say, speaking of improved cottages; "This improvement would lower the rates considerably; there would be less sickness, less illness, fewer illegitimate children, less unpleasant concomitants with reference to our parishes." Having thus passed in review some of the hindrances with the remedies connected with British agriculture, let us proceed to consider what is of no less interest to ourselves, viz., "What is the present position of the Tenant Farmer?" I think it will not require a deal of beating about or tacking to windward to get at his real position, neither need I dwell long upon it. By position, I mean in a pecuniary sense; in short, has farming latterly been a profitable occupation? To take the last ten years, from 1860 to 1870, has the tilling of the soil been a profitable business? I say not. I venture to assert that if every occupier of land of these surrounding counties had kept a fair and correct balance-sheet for each year, and if every such balance-sheet were brought together and a general average for the ten years taken, there would not be upon the whole capital employed a profit of—shall I say 10 per cent. or 5? I will go still lower and say 2½ per cent. If this is thought to be a wild assertion I hope I shall be corrected. I refer not to my own or any individual cases, but to the whole surrounding district as stated. Is there then a sufficient inducement in this respect to enter upon it? Decidedly not. If a diligent frugal man spends the prime of his life for such a return is he doing what he ought? I think not; he certainly ought to make a return of at least 10 per cent. Lower as I am of agriculture, it will be my endeavour to persuade those with whom I have influence not to embark in it, unless a brighter prospect appears. I do not mean to say that each or any individual has only made 2½ per cent., there have of course been variations as in every case; some few have doubtless made more and some a great deal less. In the above calculation or advancement let it be understood I do not include housekeeping or any private expenses, but merely the outgoings and incomings on the farm. It would be well for those who fancy such great things for agriculture to bear in mind what influence untoward weather of all kinds has upon the farmer; his men must be paid anyhow; his flocks and herds must be kept and fed if at a loss; his crops are all exposed to extremes of weather, either wet, cold, or drought, blight, and such like, and many other things unseen and unthought of by those not engaged in it. Weather and seasons must have a great influence for weal or for woe upon the farmer. If such then is a true description of the present position of "British Agriculture and the Tenant Farmer," many may be disposed to look upon it as a hopeless case; but no, it is not so. Remove the obstructions now unfairly existing upon land; let all property bear its fair share of the burdens of the country; place agriculture upon a fair and satisfactory footing, and I imagine I foresee a bright future yet in store. Agriculture is not yet fully developed: see the advancement made in late years. What with the aid of steam and the enterprising spirit of the age, I believe much more may be done than ever yet has been. A vast amount of capital is ready even now to be expended in all permanent improvements, and only waiting to be called for, and as fast as all drawbacks and impediments are removed, so fast will increased capital be brought to bear, and increased productiveness and fruitfulness be the result. I will refer to the farming of Mr. Prout, at Sawbridgeworth, in Hertfordshire, and most of us are acquainted with an estate near, occupied by the owner, where the improvement that has been made is great. Originally poor land, thoroughly drained and cultivated, now doubled in value; all necessary hedge-rows and woods removed, good and suitable cottages in sufficiency erected, with first-rate farm-buildings, and in fact improvements made in every needful way, doubtless at very considerably expense, but probably remunerative in the end. I allude to Mr. Foxe's estate at Adbury.

THE DORCHESTER FARMERS' CLUB.

THE CULTIVATION OF FLAX.

At the meeting of this Club, Mr. J. G. Homer in the chair, Mr. DAMEN said he felt a difficulty in introducing the subject, inasmuch as practically he was supposed not to be so well acquainted with it as were some of his friends. For three thousand years all civilised nations had cultivated flax. In several places in the Holy Scriptures flax was mentioned; there was the best possible evidence that the fine linen referred to in the Bible was made from flax. It was an extraordinary fact that even in those early days flax was manufactured to the greatest possible perfection, perhaps better than any machinery of the present day had been known to work it. By microscopic examination it had recently been ascertained that the cloth in which the mummies of Egypt were enveloped was linen. Some of the linen used three thousand years ago might have been of a rude description, but it seemed to have been extensively used, for it was a fact that all the mummies produced, including those seen in the British Museum, were covered with linen made from flax; some of them had as much as 60 yards wrapped round them. The linen taken from the mummies of Egypt had been converted into paper. It was rather extraordinary that all civilised nations should have cultivated flax and been clothed with it. Egypt was the great country of its cultivation, Herodotus speaking of its great flax trade; even in the present day great quantities were grown there. The lowlands by the banks of the Nile were adapted to the growth of flax; there it flourished most. In the hot countries especially the people were chiefly clothed with flax, while in the cold countries wool was used for clothing. Regarding the introduction of flax into this country the period was not very clear; but it was quite evident that it was not brought here for a considerable time after the period to which he had just been referring. Prior to the civilisation of England, when the people were savages, they clothed themselves with the skins of animals in winter, and painted themselves in summer. But when Christianity was introduced they began to clothe themselves in a Christian manner—perhaps more Christian than in the present day—and flax, on its introduction, soon became extensively used. There was no machinery to manufacture it in those days, but it was spun by the matrons and maidens. For a great number of years, not only in foreign countries, but in this country also, it was spun, and with it the people were clothed. It was considered a duty that every person, high and low, should have the distaff and the spindle for working flax and wool, more especially the former. It was related of King Alfred the Great, who lived a thousand years ago, that he told the Queen of Persia that the robes which he wore were not only presented to him by his sisters but also made by them—thus showing that all classes were skilled in the use of flax. In the present day they knew nothing of spinning a yarn, except the sort he was now spinning, and which he thought would be unravelled before he went home. So important was this flax that every fishing net had been made from it; from the time of the Saviour to the present period, for 1,800 years, the nets which had caught fish for feeding countless millions of people had been manufactured from flax. This showed the importance of the article. He was about to speak to them on the necessity of growing flax, which was so much required in this country. He was indebted to his intelligent friend Mr. Suttel, of Pymore Mills, Bridport, for furnishing him with some particulars with respect to the quantity of flax imported into this country. The quantity yearly imported at Bridport Harbour alone—and it was chiefly Russian—was about 1,400 tons, the value of the same being about £80,000. A considerable quantity was also received from Bristol and other places by railway. Besides the above, Mr. Suttel estimated the quantity grown in Dorsetshire, Somerset, and Devon—nearly the whole of which was consumed in the neighbourhood of Bridport—to be annually from 400 to 500 tons, which they would observe was only about one-third of the quantity imported at Bridport Harbour alone. Indeed he (Mr. Damen) believed that last month there

were foreign vessels in the harbour discharging at the same time flax of the value of £50,000. In England in 1868 the quantity of flax grown covered 15,828 acres; in Wales, 169 acres; in Scotland, 1,546 acres; in Ireland, 206,446 acres—total, 223,989 acres, being about 50,000 tons. It would be observed that the acreage in Ireland was more than ten times that in England. Notwithstanding this extensive produce, however, the importation in 1868—and it was a fact well worth attention—amounted to 90,833 tons, or nearly double the amount of the whole produce of the United Kingdom. The value of these imports was nearly a million, or to speak within the mark £750,000. He (Mr. Damen) apprehended that however much flax was grown in England, there would always be found a market, and a ready market, for it. The demand was extraordinary. This county, perhaps, had become the best market in the United Kingdom; the only wonder was that where the land was adapted for the growth of flax so little was grown. In Ireland growers had often to send 40 or 50 miles to a scutching mill. It was strange that the market at home was not better supplied from places where the climate was adapted to the growth of flax. "Coker sail cloth" was known throughout the world, and the reputation of Coker was such that sail cloth manufactured at Bridport was said to have come from "Bridport, near Coker." Coker then had an established fame. It was an extraordinary thing, he thought, that considering the great demand, there was under cultivation in England a less quantity than 20,000 acres. He could not help thinking that its cultivation must be more or less profitable. If farmers would only take the necessary trouble in getting their land in good order, they might cultivate flax which would realise a remunerative price. It must be remembered that the past year had been one of the worst seasons experienced for a long time. But in the lower part of the county—a field of Mr. Bryant's, at Broadwinsor, 20 acres were sold by auction, and £14 per acre was realised. As regarded the profit arising from the cultivation of flax, it was a well known fact that in Ireland and Belgium men rise from a state of indigence to that of affluence by growing it; he had known, some years ago, many men in the western part of this county grow flax, and thus rise to affluence. He could not believe that the bugbear, "trouble" had restricted its growth. The men of Dorset were ready as a rule to embrace all improved systems of farming, and he could not understand why flax should not be grown because of the "trouble" involved. Indeed everything required trouble to be taken; all improvements took time and trouble. He could not think that the reason why flax had not been more extensively cultivated was the trouble involved; he was rather disposed to think it was because their attention had not been sufficiently drawn to it. For a considerable period the growth of flax was, in the leases granted to farmers, prohibited. But he was sure that time had gone by; they would not now find any intelligent landlord object to the growing of flax, which did not, he (Mr. Damen) knew, deteriorate the land. From his own little experience in growing flax it had been the most profitable part of farming he had ever practised, although it was in the rudest possible way. He had to hire men from the West. It was said that the wise men did not come from the West; but at all events he was sure that wet men come from the West, for he never saw workmen who wanted more beer than those whom he had engaged did. But taking all that into consideration he was quite sure that the flax crop was a profitable one to him. He grew good flax and good turnips, and wheat sown the same year turned out a good crop. The old way of scutching the flax was an expensive way, but much improvement had been effected lately. He was not sure that under the new system the quality was much better; but they were certain to have it more regular under that system than under the old one. A visit to the scutching machine of Mr. R. Smith, of Stafford, would show them the perfection arrived at. The machine

was simplicity itself. There was nothing in it except a cylinder with a certain number of wooden swords turning round to knock the woody core out of the flax, which was the same principle as that of the other machine. Last week, at Mr. Brown's at Seavington, he saw a useful machine driven by steam, with which he was much pleased; six men attended by two boys were engaged at it. There was none of the drying system by fire. The sheaves were passed through rollers, half the length of the table now before him; one boy was feeding at the end of the rollers, and the other boy handed them to the men as they passed through. The men stated in reply to his inquiry that they earned 7d. per dozen of 12lbs., and that done under the old system the same quantity was worth 14d. Each man did at present about seven dozen per day, thus gaining about 4s. 1d.; but after the boys had been paid the net wages reached about 3s. 6d. daily. He then examined the little humble engine which was at work driving all the machinery. He found to his surprise that it never consumed any coals. What then did it burn? Why the "skimp" or woody core from the flax kept the engine going. Thus there was not a farthing expense incurred in fuel, which was of course a very great consideration indeed. The work appeared to him to be perfect as far as he could ascertain. The steam was used for other purposes, and the waste steam was driven into troughs of roots, chaff, &c., for stock. Climate, he well knew, was an important matter in the cultivation of flax, but he felt that theirs was as well adapted as that in any other part of England. Their climate was generally moist, and they did not suffer from the extensive drought which prevailed further eastward. He was sure that it was better here than in Ireland, where the seed could not be so successfully saved, nearly the whole used being imported from Riga and Belgium. Contrasted with this, in England the climate was adapted for the saving of both seed and flax. It really did seem to him that it would be a grand thing if the money sent out of this country could be saved in any way. Could not, for instance, a portion of the money sent out of Bridport—£80,000 or £100,000 a-year—be saved? Surely such a saving would be a national benefit. And not only that; but who could tell what would be the effect of war? Therefore, it was not well to depend so much upon Russia, or any other country, for our supplies. We depended upon Russia for flax, as we had depended upon America for cotton; and when the supply of the latter was stopped, in consequence of the internecine struggle which took place, we had to send thousands of pounds to the north for the relief of the cotton spinners. Cotton could not be grown in this country; but we could grow any quantity of flax. If a war should unfortunately break out between England and Russia, what an advantage it would be to grow flax more extensively at home! With regard to the £80,000 or £100,000 sent annually out of the country for flax, how much of that money could be spent in labour? He believed about one third. There was the great fact that the population of the country was rapidly increasing. Here, then, were the means of providing for the surplus labour—let more flax be cultivated. He would not, however, recommend extensive flax growing where there was a scarcity of labour, where the number of cottages was small, where there was much trouble in getting men especially at harvest time, because the flax crop came just before harvest. Therefore he would only recommend the sowing, as a rule, of a limited quantity of land. It was said, and said, as he believed, with truth, that flax should not be grown on the same land more than once in eight or ten years—not that it deteriorated the land for other crops, but that some change took place in the soil, rendering it unadapted for the same crop for several years. He was of opinion that one-tenth of a farm might in some cases be appropriated to the cultivation of flax—thus on a farm of 200 acres there could be 20 acres of flax. Mr. Smith, of Stafford, had, he believed, 20 acres. They should thoroughly understand he did not recommend the substitution of a crop of flax for one of corn; that he considered would be the greatest possible mistake for they would require their corn and roots as at present. But he recommended flax as a catch crop. He wanted them to try to meet the increased expenses of their farms. He felt sure there was room for both corn and flax. Respecting the mode of growing flax, he said in the first place, let them not sow it after turnips; it was a well admitted principle that it did not thrive when thus sown, neither should they sow it on foul land, nor yet on exhausted land. In well prepared soil flax

might be grown with the greatest possible advantage after wheat. Let the land be ploughed in the autumn and stay till the spring, when it might be ploughed again if desirable; let the seed be sown at the beginning of March if possible so that it would come up as much before corn harvest as possible. He was quite sure that they might grow good turnips after it. If they could find a crop of flax to pay them £10 or £12 per acre as an intervening crop it was, he felt sure, worth having. The quantity of seeds required was from two to two and a-half bushels per acre. Two bushels were the lowest quantity; about nine pecks were the medium quantity that should be sown. There would, with an average crop on good and useful land in that neighbourhood, be a yield of two and a-half packs, or 50 dozen to the acre, and twelve bushels of seed; that was about the average.

The CHAIRMAN thought they were all very much interested in the subject of flax growing. Many practical men were now growing flax, and could give some information with respect to its cultivation. In the course of the address two or three things had struck him (Mr. J. G. Homer), and he should like to hear them explained. Mr. Damen had made an observation with regard to the farmer sowing 10 or 20 acres of corn land for the cultivation of flax but seemed to think that the crop should be a catch crop. Now to his own mind there arose the question whether or not they could grow turnips after flax in the same year. Mr. Damen had pointed out that by the cultivation of flax the number of labourers on the farm would be increased considerably. There could be no doubt on that point; but he should like to know what would be the difference of labour involved in growing ten acres of flax and that involved in the cultivation of the same extent of corn. Then again, the profit arising from the flax could be placed against that arising from the corn. They must further consider the difference between the value of foreign flax, and that of English flax. Perhaps one of their new members, who was a practical man, would afford them a little information on that point. There were certainly several matters on which practical men could enlighten them. As for himself he was a novice with regard to the growth of flax, and he would now give way to other members of the Club of more experience. He wished that their friends Messrs. Smith had been present, for they had been somewhat extensive growers.

Mr. ROWE, of Dorchester, stated an instance of the paucity of labourers.

Mr. G. W. HOMER had had three years' experience in the cultivation of flax, and had found two out of three crops to be remunerative. While the second crop yielded three-and-a-half packs per acre, the third crop did not yield above a quarter of a pack per acre, and, therefore, was an utter failure. This he found to be the case on light land. Deeper and more suitable soil than that in this neighbourhood was required for the growth of flax with certainty. Plenty of manure was needed in the growth of flax; and he did not think the labour-question was a serious one—there could be no difficulty, he thought, in getting men to do the work. Regarding the question of profit, the present year's crop yielded £19, having cost £8, while the second year's crop was better still, the third year's being a total failure. With respect to another point, everybody who grew flax should not sell the seed, but consume it on the farm. From his own experience, he could speak to its usefulness and value as food for stock of all kinds. Further, it should be borne in mind that a crop of flax was exhaustive, inasmuch as there was no return beyond the seed, which was not a great bulk. Especially there should be no stint in the use of manure; they could not lay out too much in guano—it would pay extremely well to thoroughly manure the land.

Mr. J. C. FOOKS, whose father had grown flax to advantage, spoke to the difference in localities regarding climate and soil, showing the superiority of some over others for the cultivation of flax. What could be done successfully in some parts—Bridport, for instance, was impracticable in other neighbourhoods where the soil was thin, and required to be well-manured. He agreed as to the advantage accruing to the farmer from the growing of a catch crop, provided that the crop was not flax, but an extra crop of turnips. He deemed it of the utmost importance to produce all the food they possibly could for the maintenance of stock upon the farm. There could be no doubt, he admitted, that in certain localities flax could be grown with great advantage, although,

perhaps, not to a great extent. Mr. Damen had suggested the use of one-tenth of the land for the cultivation of flax. Now in certain places—perhaps at Stafford, where Mr. Smith resided, and other favoured localities—this might be done to advantage. But he could not admit that it was desirable or practicable on every farm, and impressed upon them as practical farmers the importance of growing food for stock. No doubt, if it could be shown by any friend how farming could be carried out with profit, they would all be pleased to follow his example. These were his (Mr. Fooks') views on the matter, although he could not speak as an experienced person in the cultivation of flax; for he had never grown any—and they were only his views. He did not doubt that in some cases where there was a large quantity of pasture-land, and where there was a large quantity of stock kept, flax could be grown with advantage to the grower. He coincided with some of the remarks made regarding surplus labour, admitting the advantage of giving labourers full employment; but he sought to impress upon their minds the great extent to which the practical farmer had already his attention engaged, and the importance of not neglecting more important things while attending to flax.

Mr. R. GENGE (the Vice-President) could not say anything to enlighten them respecting the cultivation of flax, about which he knew very little. Mr. Damen's remarks were characterised by good sense, and he (Mr. Genge) was sure that some present would benefit by them if as a result they grew flax in some corner on the farm, and thereby realized an odd hundred pounds or so. He fancied that flax might be cultivated without the farmer suffering any great inconvenience. Flax he could not imagine to be very exhaustive, because it was only in the ground from March to July, and, like other plants, derived a great deal of its nourishment from the atmosphere, the soil not, therefore, being much robbed. He had walked through turnips as high as the table before him, which turnips were grown after flax. Respecting locality he had been struck with the remark that it should be moist for the cultivation of flax, whereas their's was dry. Then, again, flax disliked chalk, and in this neighbourhood chalk abounded. Flax, too, could not stand checking. In this locality they were subject, as they all knew, to spring frosts. If they got the plant above ground, and the frost came, the plant grew yellow, never coming to perfection. These were difficulties, as they were aware, which could not be got over. At the same time, there were seasons when crops of flax could be grown to advantage. As in the case of Mr. G. W. Homer, there were good crops as well as bad ones. If they made up their minds to grow a good crop of flax, they could, no doubt, occasionally do so. The greatest difficulty was summer cultivation, because the drawing and harvesting came just at the time when they were busy getting turnips hoed before the corn harvest. He could not help thinking that in the cultivation of flax there was a little bit of monopoly; if it were not so, why, he asked, were not certain gentlemen present to enlighten them, and if those gentlemen did not find any difficulty in growing flax, why should the rest of them do so? He thought that some of the difficulties pre-

sented might be easily overcome. Why should they experience more trouble in growing ten acres of flax than in the cultivation of the same extent of extra wheat? Then if they consumed the flax seed on the farm, as Mr. G. W. Homer had properly observed, he thought they would derive a great benefit. They did not in these days want men in their barns the winter through, as used to be the case in the days of the flail, which had been displaced by machinery. The surplus labour could be turned to profitable account in the working of the flax that had been grown on the farm. He did not think, from what he had heard, that their English seed would bear competition with the foreign; but he should like some information on the point.

Mr. T. CHAPMAN SAUNDERS knew little concerning the cultivation of flax. From what Mr. Fooks had said, there was the danger of growing flax and neglecting certain other things. It should be borne in mind that they were not recommended to grow flax as a substitute for corn, but to follow the corn crop by a remunerative crop.

Mr. FOOT had grown flax, and found it to be more remunerative than barley. He had shown specimens to good growers who declared that they had seldom seen such good flax. It was sown on the 21st of April and harvested in the middle of July, and he could not say that it was at all an exhaustive crop; he did not think it was. He considered that what fell from the plant just before harvesting was beneficial. He certainly should not look upon it as an exhaustive crop.

Mr. CHAPMAN SAUNDERS would like to know why their friend did not pursue the growth of flax?

Mr. FOOT answered that flax growing interfered with agriculture in a general way.

Mr. CUNNINGTON had heard this mysterious subject debated as if the lives of the parties depended upon the question whether the crop was an exhaustive one; he suggested that the subject itself needed a great deal of "scutching," and that a continuation of the present discussion at another meeting was desirable. He thought that the Messrs. Smith should be brought to book and made to disgorge all they knew on the subject.

The PRESIDENT said when a man had been farming forty or fifty years he did not like to get out of the old system. If he were a young man he should certainly adopt flax growing—if he considered it profitable in farming. The great object in farming was to render it profitable. As had been well observed, successful flax-growing depended upon the soil and the climate. At Upwey, on a new piece of land, in deep black soil, it had answered remarkably well; but if he (Mr. Homer) attempted to grow flax on the higher part of his farm the crop would, he well knew, be a failure. If flax cultivation could with advantage be more extensively introduced into Dorsetshire than at present, let it be done by all means; for the man who made more of his land by employing more labour was a benefactor to his country.

Mr. DAMEN, in reply, said even Columbus would not have discovered America without the use of flax sails.

The proceedings then ended with the customary votes of thanks.

SEED CORN FOR THE FRENCH PEASANT FARMERS.

A public meeting was held on Monday, Dec. 19, at the Salisbury Hotel, Salisbury-square, Fleet-street, "for the purpose," as the notice ran, "of appointing a committee to collect subscriptions in corn and other seeds, to be supplied gratis to the suffering peasants of France, thus enabling them to sow their land, and avoid an otherwise inevitable famine." The chair was taken at five o'clock by Lord Vernon, president of the Royal Agricultural Society.

Mr. BRANDRETH GIBBS, after reading the correspondence which we have already published between Mr. James Howard, M.P., and M. Drouyn de Lhuys, relating to the subject which the meeting had to consider, read a letter from Mr. Howard to Lord Vernon, dated Brighton, Dec. 19, in which the hon. member, after regretting that the state of his health precluded his attendance that evening, proceeded to say: "I would very briefly explain why I was induced to take up the

subject of assisting the French cultivators. In the early part of October I met with friends from France who gave such a description of the desolation wrought by the contending armies, and the utter ruin which seemed inevitable to the farmers of France, unless by extraneous aid they could be supplied with seed wherewith to sow their fields; that after consulting with members of the Farmers' Club, of which I am the chairman for the year, I at once wrote to his excellency M. Drouyn de Lhuys, the president of the French National Agricultural Society, to ask his advice and co-operation. It was my intention on receiving his reply to put myself in communication with your lordship as president of the Royal Agricultural Society, and other leading men in agriculture; but on the very day I received the reply of M. Drouyn de Lhuys, I was seized with an illness which prostrated me for a month. As soon as I began to recover I wrote to his excellency to say

that I felt unable to prosecute the scheme, and recommended him to address the Earl Powis on the subject; for as the Cattle Show was at hand, his lordship, as president of the Club, would have an opportunity of bringing the subject before the farmers of England. I am very glad that the question has been taken up by your lordship and other influential men connected with agriculture, and I have no doubt that the farmers and landed proprietors of England will respond to the call for their aid in a manner not only gratifying to the general British public, but which will gladden thousands of the cultivators of the soil of France, and probably for generations beget in their minds and hearts kindly feelings towards the English people."

Letters expressing regret at their inability to attend had also been received from the Marquis of Exeter, who promised a subscription of £50; Mr. John Clayden, who promised one of £5; Mr. C. B. Amos, Professor Leone Levi, Mr. John Fowler, Mr. Branston, and others.

The CHAIRMAN said: Gentlemen, before calling upon the mover of the first resolution, I will, with your permission, make a few observations in relation to the object of this meeting. You must have learnt long before the correspondence between Mr. Howard and M. Drouyn de Lhuys was read this evening, from the reports in the public papers, what was the origin of the movement which you are now called upon to consider. It is fully described in the letter which Mr. Howard has just forwarded to me; and I am sure that everyone here deeply sympathises with that gentleman, as I do, on account of the illness which prevents him from taking the prominent part which properly belongs to him in this movement (Hear, hear). The presence of so many gentlemen this evening is a guarantee, although I must say I could wish the attendance had been larger, that there are certain leading agriculturists in this country who sympathise in the distresses of our neighbours, and who, with a cosmopolitan spirit, desire to relieve them (cheers). I think it only right at once to say that this movement is totally unconnected with the Royal Agricultural Society; and I am the more anxious to state this, because, from the prominent position which I have the honour of holding this year, it might be supposed that the resolutions which you are about to hear have been taken into consideration by the Council of that Society, and have been endorsed by them (Hear, hear). That is not the case. I have been asked to attend here this evening as an individual, and I no more represent the Royal Agricultural Society than Mr. Howard would have represented the Farmer's Club or Lord Powis the Smithfield Club (Hear, hear). We are all animated simply by an anxious desire to do good to our fellow-creatures in France. Neither has this movement any political tendency. It is necessary at once to warn the public mind against any idea that amid the terrible war which is raging abroad we sympathise in this movement either with one side or with the other. We sympathise merely in the distress under which France is suffering so terribly, and I feel certain that if the same amount of distress prevailed in Germany the agriculturists of this country would be found equally anxious to contribute towards its relief. If we consider for one moment what the horrors of this war are, and remember that in the trail of the army follow desolation, destitution, and misery; and if we try to imagine the effect of a similar state of things in our own country—then I am sure we shall all feel it our duty to come forward and do what we can to alleviate the sufferings of our neighbours (Hear, hear). Nothing can be more terrible than the accounts which we have read in the admirable letters that have appeared in the English newspapers. But if the retrospect of the past and the aspect of the present be terrible, what is there in the future? Not only are large numbers of the people of France at this moment without a home, but they have been deprived of the means of cultivating the soil. Their implements have been destroyed, their seed is gone, and there is no prospect for them in the future but starvation (Hear, hear). I cannot help thinking that if the position of affairs be well understood the great, and I may say prosperous, agricultural body of this country will sympathise with the French agriculturists in such a state of things, and the more so because the French peasantry, who are a gentle, laborious, and thrifty race, are in no way responsible for the causes and results of this dreadful war (Hear, hear). Gentlemen, I need not say any more to introduce this subject to your notice. I feel confident that if you

take up this matter earnestly—if you contribute either in grain or in money to the relief of the necessities of the French peasantry, you will have sown the seeds of unity and goodwill between the two countries in a way that hundreds of years of international intercourse could not have done (cheers). We must, however, in my opinion, be very careful in making our arrangements. It is necessary for our object that we so dispose of the contributions entrusted to us that we shall in no degree compromise the position of the Government of this country, and at the same time strictly ensure that the grain and other articles supplied shall be applied solely for the purposes for which they were subscribed (Hear, hear). They must, in fact, be used entirely for the replenishing of the land and not for the sustenance of the people in food (Hear, hear).

Mr. WREN HOSKYNs, M.P., moved the appointment of a committee of noblemen and gentlemen "for the purpose of enabling the peasant farmers of France to sow their land, and save their next year's harvest." He could assure them that he was not merely using formal language when he said that he felt the greatest pleasure in proposing that resolution; and if there were any drawback to that pleasure it was the fact that his friend, Mr. James Howard, was not present to take a prominent part in a movement, which, to repeat an expression used before, he had so generously inaugurated (cheers). It was not necessary for him to dilate upon that which the Chairman had already so ably brought before the meeting. The objects of that charitable movement, which he hoped would extend throughout the country, belonged to a class which instead of promoting the war would, he believed, if they had had an opportunity, have done everything in their power to prevent it. They should be pre-eminently objects of interest to them, because they were neighbours and allies; and surely under the circumstances of wonderful immunity which English agriculturists had enjoyed from the devastation and the awful scenes of the last four months, there was due from them something in the way of recognition of their blessings, owing to the insular position of this country, and their gratitude should take some practical form (Hear, hear). He quite agreed with their noble chairman, that they were not to be understood as taking a part on either side in that exhibition of feeling, but that it was to be regarded as an evidence of the friendly sympathy of a wealthy country, which had been saved by Providence from the trials which France and Germany had undergone, and that the aid to be afforded would have been equally extended to the other side had it been required (Hear, hear). He was old enough to remember the strong feeling excited in Lisbon by the contributions made by England after that city was devastated by an earthquake. He happened to be in Lisbon at the time; and, although this country was not then very popular in Portugal for political reasons, he was struck with the fact that the gratitude for English subscriptions far outweighed the political dissatisfaction. They had lately had abundant evidence of the immense advance made in the art of killing, in the inventions and improvements of war; and it might be thought that the world was going back, instead of advancing, in civilisation and Christianity, were it not that there had been circumstances which showed that, after all, their influence was powerfully at work in mitigating the severities of warfare. The movement which they were now inaugurating was an illustration of that, and he trusted that it would convey to the minds of their neighbours an assurance of their sympathy with them amid the trials which the war had occasioned, and that the subscriptions of the agriculturists of England would be regarded as a token of good feeling towards the agriculturists and peasantry of France (cheers).

Captain GOODENOUGH, who was introduced as the commander of the Minotaur, and a gentleman who had lately spent some weeks in the neighbourhood of Sedan, voluntarily aiding in the distribution of the French Peasants' Relief Fund, seconded the resolution. He said he was happy to state that he had recently been engaged in distributing the funds collected by the *Daily News* to the French peasants in the neighbourhood of Sedan and Metz. That fund, as the whole country knew, was collected for distribution in the north-eastern provinces of France. Mr. Bullock, however, first went to Sedan and began his distribution; and a committee formed by the Society of Friends undertook a similar work in the neighbourhood of Metz. About Sedan, where there were manufactories, the people were not so purely agricultural as around Metz, where such assistance as that proposed by the committee now

being formed would be extremely valuable and welcome. In that district the farms were not as in other parts of France, cut up into very small parcels, for there were some farms of the considerable size—for France—of 600 acres. Upon this property the steam ploughs which the Society of Friends were sending out would no doubt be able to work advantageously. He most cordially endorsed what the chairman had said with reference to the good feeling which was likely to be excited in France by expressions of sympathy like these on our part; and he could assure the meeting he had never met with anything more grateful or touching than the feelings shown towards those who distributed the *Daily News* fund in the neighbourhood of Sedan and Metz. The people at first thought the relief had come from Belgium; but when they discovered the truth their surprise was only exceeded by their grateful emotion. Already beyond question, there was growing up in the hearts of the French people a deeper friendship towards England than ever existed before. Too much importance could not be attached to the caution to be non-political; and it was very satisfactory and cheering to know that all the efforts which the agents employed near Metz and Sedan had made had been, not only received by the German authorities with great kindness, but seconded by them wherever that was possible (cheers).

Mr. AVELING, of Rochester, said everyone knew that this country when engaged in great works of charity never did things by halves, and he was quite sure the farmers of England would come forward nobly in support of this movement. But it must be borne in mind that the Society of Friends had subscribed £20,000, which was still being distributed, and it was of the highest importance that they should take care not to relieve the same persons. Knowing the north-east of France very well, he brought that subject on the previous Saturday before a considerable meeting of farmers at Canterbury, and those assembled, while desiring to respond to the utmost to the appeal now made and to help forward the movement, did not see how it was possible for contributions of seeds to be warehoused in this country without great expense, and likewise felt that when seeds had been collected it would be very difficult to distribute them among the French farmers, and they came to the conclusion that nothing but money subscriptions could produce the desired effect (Hear, hear). The meeting felt that if a large amount of subscriptions were given in kind the result would be that the seeds would suffer greatly in the warehouse from vermin, and it also thought that lest the required provision should not be made before the end of the war, funds should be collected as rapidly as possible, so that they would be at once available for the purpose. Antwerp was at the present moment over-crowded with corn seeds and seeds of every description, and the owners were only awaiting the conclusion of the war to dispose of them. In the north-eastern part of France agricultural operations were, it should be remarked, carried on by means of oxen, and there were now scarcely any oxen left.

The resolution was then carried unanimously.

Mr. H. CORBET moved the following: "That James Howard, Esq., M.P., be, and is hereby, appointed honorary treasurer; Brandreth Gibbs, Esq., and H. M. Jenkins, Esq., honorary secretaries; and W. H. Delano, Esq., honorary agents in England of the Société d'Agriculture de France." He felt the greatest pleasure in moving this resolution, because he thought that without identifying themselves with the societies with which they were connected, the gentlemen named in the resolution would enable the committee to get at the classes whom it was most desirable to reach. He quite agreed with the supporter of the first resolution, that nothing could be done without money. The farmers of this country ought only to be expected to contribute seeds; but for the carrying out of the very difficult and delicate duty which was being undertaken, there must be plenty of funds; and when he saw the names of Mr. Brandreth Gibbs and Mr. Jenkins, he felt confident that they would be enabled to get at the two great classes of landlords and farmers (Hear, hear). On the one hand the farmers would, no doubt, be willing to contribute seed-corn, while on the other they had already seen indications that the landlords were prepared to do their part in the form of money subscriptions (cheers). There was another great interest—a collateral interest connected with agriculture—which ought not to be overlooked. He felt that, by asking the implement makers to contribute implements, they would rather retard than advance

the object; but at the same time he felt it to be very desirable that not merely implement makers, but seed merchants and the corn merchants of Mark-lane should be asked to contribute money. In that way a machinery could have been set in motion, which it might be hoped would embrace all classes connected with English agriculture.

Mr. ALLENDER in seconding the resolution, after expressing a hope that the work of collection would be proceeded with as rapidly as possible, deprecated any throwing of cold water upon the movement as tending to dishearten those who were engaged on it.

The resolution was then put and adopted.

Mr. ALBRIGHT (of Birmingham) moved the next resolution, viz.: "That secretaries of Agricultural Societies, Farmers' Clubs, Chambers of Agriculture, and clerks of corn and cattle markets be, and are hereby requested to give publicity to the appeal to be issued by the committee, and to aid in forming local committees to collect contributions, and otherwise aid the general committee in London." He was exceedingly struck by the remark of the late Foreign Minister of France (M. Drouyn de Lhuys) that the cultivators of the soil were, like the soil itself, likely to yield a grateful return for whatever care was bestowed upon them. He was exceedingly glad that the meeting had not forgotten the maxim, "Honour to whom honour is due,"—to Mr. James Howard, who was the real starting-point in this movement. The very idea of seed was calculated to awaken the deepest feelings of our nature. A bard of Derbyshire said, in a beautiful poem,

The world's support depends upon the shooting of the seeds.

Most assuredly the support of the French nation in future depended upon this country's finding seed for it. There, in a nutshell, was the position in which French agriculture now stood. While agreeing with Mr. Aveling that contributions in money were desirable, he thought the committee would fail in their object if they confined their receipts to them, or expected large sums of money from the farmers. His own belief was that for one farmer who would put his hand into his pocket and give a guinea, there were twenty who would willingly send half-a-sovereign's worth of seed (Hear, hear). The member for South Warwickshire (Mr. Wise) put the matter in a nutshell when he said the other day that the farmers there had been so drained by subscriptions to the funds for the sick and wounded that it was useless to ask for any more money, and what applied to Warwickshire would, no doubt, apply to other counties. He had just come from the Committee of the Society of Friends, and could promise that all they could do without abandoning their own operations they would do. He had seen a return from one village where there were seventy-six proprietors, and the needs of that village in corn were something like $7\frac{1}{2}$ tons. As regarded the question of railway transit, he had been in communication with Mr. Allport, manager of the Midland Railway, and other railway authorities of high position, on that subject; and although it was no doubt a correct principle that only in very rare and exceptional instances should railway companies spend any of their funds in a benevolent manner, he believed that was a case in which such a course would not be objected to. It should not be forgotten that in one point of view the railway companies were among the largest landed-proprietors in the country. There were altogether 15,000 miles of railway, covering something like ten acres per mile, making a total of 150,000 acres. As, therefore, the railway companies were among the most extensive landed-proprietors, he hoped every facility would be given for the transit of corn; and if the committee could not get perfect immunity of freight all over the country, he believed that in a national movement of this kind there would be some very marked reductions in railway charges, and a low carriage freight would prevail so far as that object was concerned all over the country (Hear, hear). That object was, in fact, one which must commend itself to the good feeling by everyone, and he trusted there would be no difficulty in securing the requisite funds. He had himself obtained from various persons promises of subscriptions which amounted in the aggregate to between six and seven hundred pounds, all to be devoted either to the purchase of grain, or to the expense of conducting that benevolent enterprise; and he hoped that the liberality thus commenced would be widely imitated.

Mr. SUTTON, of Reading, in seconding the resolution, said

he was delighted that Mr. Howard had originated something like a national movement in furtherance of such an excellent object. He knew something of the part of France which had been referred to, and of the habits of the population; and he was satisfied that there was a real necessity for this effort, and that it ought to be at once extensive and prompt. On the 31st of October, immediately after the surrender of Metz, he wrote to a member of a large seed firm in Metz, condoling with him on the state of his country; and in a few days he received from him a reply, in which he said, "I thank you most heartily for your friendly sympathy. Thank God, we did not suffer much ourselves, but the farms all round the district are entirely desolated. The British Society for Relief has already done a great deal of good; and we are most thankful for the kind help which has come." The writer added that the English people should take care to send what was most needed and most useful. That letter was addressed to the firm of Sutton and Sons, of Reading, of which he was a member. He had also seen a letter from an agent of the Society of Friends, who had laboured in the district around Metz. After describing the desolation which prevailed, the writer said, "An area of land about 200 miles in length and 60 miles in width has been prevented from yielding crops, in consequence of the armies marching over it, and the peasants have nothing with which to sow the soil next year." He summed up by saying, "The four great requisites are food, fuel, clothing, and seed-corn" (Hear, hear). He (Mr. Sutton) knew that they would want money for this object, as well as relief in kind; but he had found, from his communications with farmers on the subject, that they would be delighted to send some of their best wheat, barley, and oats for their suffering brethren on the Continent, and seemed to think that that was their proper part, and that money subscriptions should be obtained from others. He had been authorised by the firm to which he belonged to offer several cwts. of seed; but since he entered that room he had been led to the conclusion that what would be most useful and convenient, on the whole, would be subscriptions in money, and therefore he now offered to the Committee, in the name of Messrs. Sutton and Sons, of Reading, £100 in cash (cheers).

Mr. SPECKLEY, in supporting the resolution, said he believed that that movement was one of the kindest enterprises that could be commenced on behalf of suffering France, and he had no hesitation in saying that if a proper appeal were made almost any amount of money might be collected in the City of London.

The resolution was then adopted.

Mr. H. TRETHEWY moved the next resolution, viz.: "That the general committee be, and are hereby authorised to purchase seeds with money subscriptions, after having ascertained what corn and other seeds are most likely to be useful." He said that resolution appeared to him to form the pith of the whole matter, and he hoped that whatever feelings or views there might be as to other forms of assistance, there would be perfect unanimity on that point; so that the committee would be enabled to carry out the object for which they were called together, namely to secure the sending of seeds to France. Much had been said with regard to the necessity of sending those seeds, but he would beg permission to throw out a hint in accordance with the view of the noble lord, that the seed sent out should be really used as seed and not as food. He would suggest that the committee should, in the exercise of their discretion, adopt some means or other for securing that important object (Hear, hear).

Mr. J. R. ROBINSON (Manager of the *Daily News*), who seconded the resolution, reminded the meeting that from the first a want of seed corn had been spoken of by various gentlemen who had visited the devastated districts. The mayors of the villages also made an appeal at the commencement of the movement which the meeting was promoting. That appeal contained the following: "In the sections of country that have been traversed by the German armies nothing remains of the provisions that had been accumulated in time of peace. Our houses, stables, and barns are burned or riddled with cannon-shots. The fields and meadows are trampled down by the tread of embattled hosts. Neither cereals nor grass have been harvested this autumn. All our beasts of burden, all our bees, sheep, and swine have been taken from us. Our labourers are either pressed into the French army as soldiers, or into the German army as teamsters. There re-

mains not even seed-corn. We are destitute of strength to prepare the trampled ground for seed for next season's harvest, and destitute of material to sow." A letter received a few days ago from France said upon the same subject: "When we stopped, after a fatiguing round through a number of field lazarets, our talk turned upon the misery in which the peasants of the ravaged districts lingered between life and death, without nourishment enough to ward off the typhoid form of dysentery with which nearly all are afflicted, and which must shortly become epidemic unless energetic help arrives. When I understood that not only the horses, cattle, and strong men were gone, but that next year's supply of food would depend on grain to be sown, and that even the pittance necessary for this sowing was taken from them, while their agricultural tools and machinery, and even the vehicles that were not taken for army transports, had been cut up and burnt for camp firewood—when I saw that they had neither victuals nor means of procuring victuals from the distant parts of the country, which are less depleted, I asked, 'What can be done to help this wretchedness?' There could be no doubt, whatever, therefore, that seed corn was badly wanted in all directions, and the committee, happily, would have the advantage of not working in the dark. The Society of Friends amongst the distressed French people was represented by eminently practical men; and so far as the French Peasants Relief Fund was concerned, he had in his hand the skeleton of a return which, when filled up, as would be the case in a few days, would give a list of 25 villages, with the number of indigent, the nature of their ordinary employment, the probable duration of distress, and a number of other details to guide those who distributed the relief. The exact wants of each village were accordingly known with considerable accuracy, so that the committee would have no difficulty in avoiding any very serious error. In justice to the poor distressed creatures for whom our sympathies were invited, it should be borne in mind that they were most anxious to earn their own subsistence if they could, and all accounts agreed that there had been a marked absence of attempts to abuse the kindness offered (Hear, hear). He might mention as an interesting fact, supplied to him in a recent communication from the United States that the American farmers were contemplating a movement similar to that under discussion. The object of these efforts in England not being to pauperise the recipients of relief, it was most desirable as soon as possible to see the people depending upon themselves as before, and the operations of the newly-formed committee would, he believed, work powerfully towards that end, not only because it would assist a return to necessary farming operations, but because a revival of one form of industry generally awakened and strengthened others. The farmers of England in subscribing to the fund would taste the luxury of relieving the distresses of their fellow creatures; and at the same time they would do an eminently practical work, which could not but tend to foster kindly feelings towards us as a people in return for assistance offered in a spirit of manly respect which had not even the suggestion of humiliation towards those who received it (cheers).

Mr. HALL said: Having had considerable experience in connection with the supply of bandages for the wounded, he felt quite sure that subscriptions of money would be found preferable to subscriptions in kind. He was happy to say that the railway companies had conveyed 42 tons of bandages free of charge (cheers); and he felt certain that they would be willing to convey corn-seed without any payment. In conclusion, he suggested that the sackmakers of the country should be requested to supply the committee with bags gratis.

The resolution was then carried.

Mr. SIDNEY moved: "That the General Committee be, and are hereby authorised either to obtain the loan of, or to rent one or more suitable warehouses for storing contributions." He represented officially a commercial and not a philanthropic company; but nevertheless he believed the Directors of the Agricultural Hall Company would be happy to place rooms for storing at the disposal of the Committee.

Dr. LEWIS, of Glamorgan, who was announced as having lately spent some time in the north-east of France in the exercise of the duties of his profession, observed that there could be no doubt that a vast proportion of English farmers, especially of the smaller class, would rather subscribe in kind

than in money; but he thought all aid in kind should be accepted, and the Committee might convert a portion of such contributions into money if they thought fit. He testified from observation to the great need of seed-corn in the north-east of France, and observed that having traversed the whole country from Strasburg to Paris, he found there an exceedingly fine field for steam cultivation, the small allotment system presenting no practical difficulty if the engines ploughed across the land.

The resolution was then agreed to.

The CHAIRMAN having invited suggestions or remarks from any gentleman present in furtherance of the object,

Mr. ALBRIGHT mentioned specially a number of subscriptions on his own list which had been promised, including £100 from the Mayor of Birmingham, £100 from Sir T. F. Buxton, 10 guineas from Lord Leigh, £100 from Mrs. Gibson, of Saffron Walden, and a promise from Mr. Joseph Smith, of Henley in Arden, of 17 stones of seeds, that being his own weight (laughter). He added that Mr. Millis, Coventry, of the London Corn Exchange, had offered to receive subscriptions, and, if agents were wanted, to purchase without any commission; and, further, that contributions of seed-corn might at once be sent to No. 154, Minories. He likewise stated that Mr. Fowler, of Leeds, had offered a steam cultivator on terms which would be equivalent to a subscription of £500 to the fund.

Mr. R. D. WILSON, of Lincoln's-inn, said he had been engaged for some time in assisting Mr. Bullock in distributing the *Daily News* Relief Fund, and he could assure the meeting that assistance was only given where it was really required. In every French village there were the mayor, the curé, and a *bureau de bienfaisance*, formed of inhabitants, who acted as a committee of charity. In distributing the fund to which he had referred, they found it advisable to co-operate with the mayor and curé, and two or three of the *bureau de bienfaisance*. By following this example the committee would be able to secure that the corn sent out should find its way to the persons who were unable to help themselves (Hear, hear).

Mr. CADLE moved, "That the thanks of this meeting be, and are hereby voted to the directors and manager of the Salisbury Hotel Company for their liberality in placing this room gratuitously at the service of the promoters of this movement."

M. BARRAL, in seconding this, said I beg in the name of France, and particularly in that of the French agricultural press, to give you our most grateful thanks for what you are doing, and we hope one day to show you how great are our gratitude and friendship towards England; allow me give our special thanks to your aristocracy, who are always at the head of such undertakings as the one that occupies you to-night; allow me to add that if we had in France such a noble, able, and kind-hearted aristocracy as yours, we should not ask for a republic, but would have the same form of government as your own.

The motion was then adopted.

Mr. CAIRD, in moving a vote of thanks to the Chairman, said he considered it of the utmost importance that they had in the chair one who had not only been long known for the interest which he took in agriculture, but at that moment held the high position of President of the Royal Agricultural Society of England. That was important because it was desirable that such a movement should exercise a national influence and beget national sympathy throughout the country. He did not know whether the National Agricultural Society of his own country—Scotland—would take up the matter, but he thought it very probable that it would—and the same remark applied to the Irish Society; but whether that were the case or not, the fact which he had just mentioned could not fail to produce a great impression in France: that was simply a question of sympathy amid the misfortunes which had befallen a neighbouring country. It had been assumed by some speakers that the north-east of France would receive all the benefit arising from this movement, but he trusted that the succour to be rendered would not be confined to any particular part of France, but that wherever a need for help existed it would be supplied (cheers).

Mr. R. LEEDS, in seconding the motion, said he was sure they all felt exceedingly obliged to the noble lord for presiding; and as regarded the object of the meeting, he could only say, as a tenant farmer, that he hoped his brother farmers would do, as he wished to do himself, all that they could for its promotion (cheers).

The motion having been put by Mr. WREN HOSKINS, and carried by acclamation,

The CHAIRMAN, after returning thanks, said, I wish to say one or two words with regard to the result of this meeting. So far as I can judge, although the number assembled is not large, those who have attended are all in earnest about the work which has been undertaken (cheers). We have heard from several speakers very valuable hints with respect to the mode in which contributions should be raised, some gentlemen appearing to think that money should be contributed as well as grain, and others, that it would be best in all cases to subscribe money. We have also had promises of warehouse room, which are very important at the commencement of such an undertaking. We have likewise received hints from gentlemen who have lately visited France, and to whom this country is very much indebted for having represented it in so disinterested a manner with respect to the mode in which this object should be carried out; and lastly, we have been reminded of the necessity of administering what is raised in such a way as not in any degree to pauperise those who are assisted. There are, no doubt, many matters of detail which will have to be carefully considered by those who have been requested to carry on the work; but when men are in earnest in a matter of this kind difficulties soon disappear (Hear, hear).

Subscriptions amounting altogether to nearly £1,000 were announced before the meeting dispersed.

At a preliminary meeting held in Edinburgh, Mr. Robert Scot Skirving, Camptoun, President of the Scottish Chamber of Agriculture, in the chair, a large number of letters sympathising with the object were read. The member for Berwickshire writes in the following terms:

Ladykirk, Berwickshire, Dec. 20, 1870.

My dear Sir,—I have the pleasure of receiving your letter. I consider the purpose of it a most excellent one. The war still raging between France and Prussia I consider the most deplorable event of our day, and ought to have ended long ago. France was clearly to blame, and Louis Napoleon especially, for its declaration. Prussia and its King are now as clearly to blame for its continuance. The parties whom we propose to succour are in no way to blame. Few things are more proper in this world than aiding people in distress, especially when it has been brought on by no fault of their own. I consider nothing could be better timed (and I give you all a great deal of credit who have originated your present proposal), than that of supplying the poor farmers of France with seed for their corn crops. I have the greatest pleasure in sending you enclosed a cheque for 10 guineas for the promotion of your great and good object, and will have no less pleasure in doubling the amount if it be required; and pray believe me, my dear sir, yours most sincerely,

DAVID ROBERTSON.

Charles Stevenson, Esq., Edinburgh.

The following gentlemen were appointed to act as members of committee: Messrs. David Robertson, M.P.; Peter M'Lagan, M.P.; Sir A. C. R. Gibson Maitland, Bart., M.P.; Messrs. William Dingwall Fordyce, M.P.; Wellwood H. Maxwell, M.P.; James Dyce Nicol, M.P.; Charles Lawson, jun., Edinburgh; D. Cross, Glasgow; G. Hope, Fenton Barns; J. Melvin, Bonnington; A. M'Neel Caird, Stranraer; W. Goodlet, Bolshan; W. Hope, Leith; J. Miller, M.P.; R. Scot Skirving, Camptoun, convener, with power to add to their number.

The meeting was of opinion that, however urgent the necessity, no grain should be forwarded to France until absolute guarantees were obtained from both the contending parties that the corn should be only used for the purpose for which it was sent, viz., seeding the fields of France which have been desolated by the present war.

THE FRAMLINGHAM FARMERS' CLUB.

THE STABLE.

At the December meeting the subject was "What are the duties of the stable as compared with its customs?" when Mr. C. W. SUTTON, of Stowmarket, read the following paper:

Perhaps the title of my paper does not fully convey to you what I intend to be the object of it; and it is not quite clear to me if I ought not rather to have announced it in this way—"What are the duties of the stable as compared with its customs." Most of you know the great love I have for every subject connected with the horse, and in fact all our domesticated animals, which is my plea for presuming to introduce this subject to-night. I will not say much upon the stable, as this paper deals more with the duties connected with it. In the architecture and management of the stable we must consider the uses for which it is required, for one that would suit the forced and somewhat artificial life of the racehorse would be quite out of character for horses for general purposes. All our stables should be constructed to secure good ventilation, light, height, drainage, and facility for cleanliness; they should not be damp, and possess a fairly even temperature both in summer and winter. Damp and badly lighted and ventilated stables are the pest-houses where valuable animals soon lose life and spirit, promote a staring coat, and by impairing the vital powers incite a susceptibility to receive any prevailing epidemic, such as strangles and influenza, to say nothing of such ills as diseases of the eye, grease, swelled legs, cracked heels, hidebound, &c.; and that there are many such places in existence now there can be no reasonable doubt, and although a bad pavement is, perhaps, found more especially in the stables of agricultural horses, I have seen many other stables where the paving-stones were rough and uneven, and the floor as full of holes and inequalities as some of the old pavements in a London street. On these the wretched occupants are made to stand, their feet taking a bearing at all sorts of angles, and unless up to their knees in straw, any attempt to lie down is attended with torture and unrest. In some stables you will see a considerable descent or slope of the floor, so that the horse is placed in an unnatural position, his chief bearing being upon the hind-quarters, whilst forward he is compelled to stand with toe up and heel down, thus throwing a constant strain upon the back sinews of the fore-leg. Such a state of things will produce sooner or later serious mischief. Again, if you keep a horse only for pleasure, and do not give him sufficient regular exercise on those days when you do not use him, he will get out of condition, no matter how good a stable he may have. Therefore, although I would see all stables constructed to secure plenty of light, good ventilation, with a well-arranged system of drainage, I contend that these will ever be subservient to other matters of management, which must be attended to, in order that you may have the health of your horses preserved and kept up to the standard of what we all understand as good condition, and let us all feel that our best interests are consulted by the proper observances due to vitality in every form. Last week I had the opportunity of inspecting the new stables built for the London General Omnibus Company, to accommodate over 600 horses. Everything that care and judgment could do seem to have been done to make them adapted to the purposes for which they were designed. The stables are each about 180 feet long, separated into compartments (each of which will receive about 20 horses), boarded from the manger to the eaves, above which all is open to the roof from one end of the building to the other. The buildings are of brick and tile, the ordinary span roof, not drawn or plastered, thus a free access of air would constantly pass between the tiles. The lighting and ventilation is from the top, and windows upon the south-east side, with latticed ventilation also above the doors. No draught could by any chance fall upon the heels or any part of the horses, or would any light be thrown upon their eyes. The floors are of granite paving, finished with grouting and cement, and so laid that there is no chance of the animal standing in

an unnatural position, but still with just sufficient fall to allow the liquid matters to pass into the drains, which are bell-trapped, and empty themselves into a tank. The loose boxes for sick horses are built upon the same plan as the stables, but additional ventilation is effected by means of perforated bricks one course from the bottom. One thing especially struck me, and that was the perfect isolation of the unhealthy or diseased from the healthy horses by using a distinct block of buildings, separated from the main body of stabling by a wall; and the inference I drew upon reflection was how useful and necessary was a small building upon your farms, where upon the first approach of any epizootic or infecting complaints, such as strangles or influenza, amongst your horses, you could at once completely sever them from any connection with healthy animals. I think one of the first stable duties is for the groom or horsekeeper to be particular to note, and at once report upon, the early or premonitory symptoms of disease, and though they be ignorant of the more intricate, yet there are symptoms which could be explained in a few words, and would be of untold service when understood. How many times has an animal, when suffering from incipient inflammation of the bowels, been urged along, though perhaps miles away from home, and roused into action, when totally unfit to move, or looked upon with apathy and indifference, when every moment lost without remedial measures was precious? The early symptoms of inflammation of the bowels are violent shiverings, legs and ears cold, body tender when touched, and the animal evidently out of sorts. Of inflammation of the lungs, breathing laboured, standing with out-stretched legs, head and ears drooping, coat staring, legs and body cold, &c., &c. Of inflammation of the kidneys, looking at the loins, head depressed, back arched, hind legs straggling, crouching under pressure applied to the loins, &c., &c. Of worms, rough, staring, unthrifty coat, craving appetite, slimy dung, &c., &c. I say how valuable is that servant who is able to notice with a quick eye any departure from the routine of health, and it is quite within the power of every owner of horses to give the necessary information. Gentlemen will do well to have a constant eye upon the legs and feet of their horses, that they may be left clean and dry, and this more especially upon the approach of winter. This is a duty upon which I would insist, and in which so many are deficient; consequently should a horse be round and fleshy-legged, a little coarsely bred, or naturally disposed to grease, a few days of neglect may render him an excellent patient to the veterinary surgeon. I would never have a horse's legs washed, or go into water without they were properly dried, and the circulation promoted afterwards by rubbing. I would rather see the legs left dirty until dry, and the dirt brushed out, than allow them to go into water without being afterwards properly attended to. Just a word on the abuse of the curry-comb, which is very useful in its place for removing scurf, and keeping the brushes right, but should never be used with one quarter the zeal and energy which too often accompanies its application; such to a horse with a tender skin, or upon one suffering from eczema, surfeit, or kindred diseases, is positive torture, and should be at once forbidden, and neither curry-comb nor hard brush should be used when a horse is shedding his coat. The stable duties on feeding and food may not be out of place here. Musty hay may be detected by its smell, colour, and mouldy appearance, which, under the microscope, is revealed as a fungus growth. This is the cause of mischief—nothing you can give your horses to eat is so unwholesome as this, and the natural instinct of any (except a gross feeder) leads him to refuse it, until driven to eat it by hunger. Some consider salt a counter-acting medium, and use it accordingly to remedy this evil, but only to find they are mistaken, and to learn from dearly-bought experience that mouldy hay is unwholesome, and will leave ill effects upon the organs of respiration sooner or later; and rest assured that the consumption of it is false economy, as it proves a poison to the horse, and not a very slow one

either. Oats should never be given new; when the March winds have dried the last year's crop they may be used, but even then they are too new for horses consuming large quantities; but for horses for general purposes they do not hurt after having been kept that time. The reason I do not like new oats is, because they are indigestible, and derange the kidneys and bowels. The horse eating them has no firmness of flesh, sweats immensely, and often a surfeity eruption, which shows itself in the form of no end of little scabs matting the hair. Bruising oats is always advantageous, but not to the same extent—they should be simply crushed, but not ground, by which the gastric juice will readily act upon the starchy kernel, and will be the more surely appropriated to the nourishment of the animal by a process of perfect digestion. Beans are a very stimulating food for the horse, and when given in too great abundance render him more susceptible to inflammatory attacks; they contain more gluten than oats, and are better calculated to supply the wear-and-tear of the muscles in very hard work, and are therefore often given by cab and omnibus proprietors, as well as for agricultural horses, as they are found cheaper than oats, and for their muscle-making properties they are the right thing to be used. But although this may be the custom it should not be carried out blindly, for the duty will be first to consider the constitutional tendencies of the animal or animals to whom they are given. Thus I should never give them to horses whose feet and legs are inclined to inflame, or if affected with thick or broken wind. To washy, light-bodied horses beans are very serviceable, enabling them to stand work better, and although when given without judgment may do harm, will still remain a valuable food. A few words on chaff before I leave the subject of food, for since the introduction of steam chaff cutters it is the custom of some gentlemen to have large heaps of chaff-cut at one time. To this the horsekeeper or groom helps himself until as it approaches the bottom a large proportion is made up of very finely cut and powdered lamina or leaf blade and other matter which has settled in the form of dust. Now I have seen the ill effects of this so often, producing constipation or stoppage as it is commonly called, that I think it wise to draw your attention to it here. The first symptoms noticed are the intestinal secretions diminished or arrested, accompanied with colicky pains (but not like colic, for there is no intermission of pain). If these symptoms do not yield to the action of purgatives, soap and water clyster, and hot fomentations to the belly, we may reasonably suspect the presence of dust ball or some such obstruction, which is often nothing more or less than a quantity of this chaffy dust which has accumulated from day to day, and becoming firmly fixed into some of the narrower parts of the larger intestines produces the obstruction, and but too often fatal inflammation. Now I might tell you the precise treatment necessary under the circumstances, but prefer to suggest in this paper merely the preventive, which is to have the chaff always used from the top of the heap, and as it comes to the bottom have it carefully freed from this dust by sifting, or adopt the Cambridgeshire method, which is to cover the floor a foot thick with cut chaff, upon this lay in heaps—say, six or eight bushels in each, chopped tares, clover grass, nettles, or any juicy vegetables that will ferment. On these some gentlemen pour a few gallons of boiling water, and cover immediately with cut straw, which must be well trodden down as the process of filling the place proceeds, during which salt in the proportion of 28 lbs. to a ton of chaff may be sprinkled on. Much depends upon the way in which this is trodden down, as one great object is to get the mixture as solid as possible. After a few days fermentation will be set up, and continue for three or four weeks; and the promoters of this system say that after the heat has subsided, the chaff will have acquired the scent of hay, and keep any length of time. But whichever plan is adopted, it will be wise to follow the old-fashioned but useful practice of giving a bran mash on a Saturday night, which will have the effect of carrying off these offending secreted matters, and prevent this mechanical stoppage. A mild dose of physic would also sometimes be useful, but I will speak of this in its place. A few words upon the subject of water. The quality of water best suited to the horse is one moderately soft—not rain water collected in tanks—for that soon becomes foul and affects the health; on the other hand, hard water does not suit, some being apt to produce hide-bound and diarrhoea; but sound horses may become used

to hard water, and it will agree with them. The water which is given the horse will affect his condition, if it is not suitable to him in quantity and quality, or if allowed to take it when heated by work. Thirst is very distressing to a horse. If he has not water when his stomach demands it, he will refuse his solid food, or drink when he gets the chance to excess. If tanks are used they must be kept very clean, or the water will get foul, and the sides covered with a slimy deposit, which not only renders the water unpleasant to the horse, but prejudicial to his health. Horses eating tares or succulent vegetables do not require so much water, too much water given them will often cause gripes; even the usual quantity of water will be found too much when they are first put upon cut grass or tares. In the stable management of the feet constant care is required, for not only are they artificially protected by shoeing, but are compelled to stand upon a substance which is not like the surface of the earth, in a state of Nature destined to bear them. Neglect a horse's feet, and they become hard and brittle; let them stand where they are constantly soaking upon wet filthy litter, and thrush will soon do a sad amount of injury to the fleshy, secreting parts, which it is the office of the hoof to protect. It is then a most important stable duty to see that the horse's feet are properly attended to. 1st. To prevent the feet becoming too dry. 2nd. To prevent thrush, which is caused by keeping them too wet. 3rd. To see that the shoes are removed when necessary, are properly secured, and that no clinches of the nails are started, so as to endanger the other leg. Now the attention necessary to keep a horse's feet from getting dry and brittle is a subject of controversy; one recommends a stopping, which another calls favourite filth, which if long continued in will produce thrush. I think a mixture of cow-dung and clay forms a stopping which to most feet will be used with advantage, say once or twice a week. Exception to this would be when a horse had either a very flat or a pomiced hoof, in which case I would not stop them at all. The use of warm water will be found, with the occasional application of some good hoof ointment, most valuable for dried, hardened, or brittle and shelly feet. Let the feet be immersed and soaked in a pail of tepid water as often as it appears necessary, and then dried and the ointment rubbed into the coronet and crust; nothing pays for attention given them better than the feet. What adds more to the perfect finish of a horse and his intrinsic worth than a good shaped, strong and perfect foot? And, on the contrary, no matter how good a horse may be in other respects, an untidy, ragged-looking foot is as much an eyesore as the same thing amongst ourselves. When shod, I would insist upon having the hoof left externally as nearly in a state of nature as possible; for the same reason, I would have the rough, horny, elastic frog untouched, in order that it may fulfil its functions as an insensible pad to prevent the jarring of the foot upon hard ground. I would never meddle with the sole. It is the natural protection of the delicate internal parts of the foot, and infinitely superior to the leather and pad substituted for it. You may have to quarrel with your smith, who generally likes to leave the foot what he calls tidy, and rasps and polishes off the very coating which nature has provided to keep the hoof strong; but if your wish be carried out, you will be repaid by keeping your horses' feet in a condition to stand the wear and tear demanded of them. I think, as a rule, gentlemen are not aware how much may be done by careful shoeing and attention, to improve contracted or brittle and shelly feet. I could scarcely believe it possible that such changes could be effected in the hoof of the horse if I had not seen them practically developed by the use of proper remedies. As to exercise. No argument is necessary upon the need of exercise amongst stable duties; but the custom is very much to ignore the fact, except, of course, in the stable where regularly professed grooms are kept. Without regular exercise no horse can be kept long in health, and I am quite satisfied that even when a horse is hardworked he would be better for a short airing every morning after feeding than to stand the whole day without it. It removes bodily obstructions, promotes the secretions and due circulation. By air and exercise we gain two material points, namely, the preservation of the horse's health, and the promotion of condition, enabling him to go through with energy and vigour the exertions required of him. We now come to physic. In my previous remarks I spoke of physic as necessary for the purpose of getting rid of accumulated food; thus, in the case of a horse brought up from grass it will be generally necessary

and always useful. Let us consider this subject under three heads:—1st. As enabling the stomach to throw off injurious food. 2nd. To give the stomach tone and strength to bear the increased stimulus often supplied by the food necessary to get a horse into condition, especially for hunting or fast work. 3rd. In conjunction with the necessary exercise to get rid of internal fat, and any lurking tendency to disease. First, as to the effect of physic enabling a horse to throw off injurious food, &c.; generally four or five drachms of aloes will be sufficient for a hack or hunter fresh from grass, and from one to two drachms more for a cart horse; no preparatory mash need be given, as the grass has done all that is necessary. This applies to the horse that comes up with plenty of size; a horse low and lean would not require it. Second, The cooling properties of physic render it very valuable in the preparation of horses for work. If at any time the legs get hot, there is no better way of relieving this unpleasant symptom. It will be proper to give a mash or two first. I believe you would get at the same result by withholding a portion of the corn, but it is then at the sacrifice of condition, and from long experience and a constant anxiety to get at the facts, I conclude that after the dose of physic the corn may be gradually increased, and with proper exercise and a mash once or twice a week, will be found the very best means to obtain that perfect condition, which is the pride of every owner of horses who is worthy of his trust. Third, To remove superfluous fluids from the body through the agency of blood vessels, absorbents and secreting organs, all of which co-operate to remove depositions of fat lodged around the heart and other internal organs. Before I leave this subject, let me caution you against the use of physic in which aloes is a component in any of the following cases. Inflammation of the bowels or intestines, bronchitis or influenza, or other affections of the mucous membrane, and it is a treacherous remedy when given in inflammation of the kidneys or during pregnancy. A horse has been killed by only a three drachm dose of aloes when suffering from bronchitis, and I have seen horses at the point of death by the injudicious administration of a dose of aloes in influenza. Fomentation is a stable duty often practised, but seldom with judgment; it is a very essential adjunct in the treatment of disease, and a few words upon this subject may not be uninteresting to you. In most cases of broken knees, for instance, instead of fomentation being a comforting and soothing process, it is exactly the contrary. The dabbing and smearing a wound of this character irritates it, and rather distributes than removes the finer particles of dirt over the entire surface of the wound. To foment a broken knee properly, get a perfectly clean sponge, with a pail of milk-warm water, soak the sponge, and press it upon the leg above the wound, and not upon it; by this means the sponge is kept free from grit, and the water in the pail also, whilst the stream of water running down the limb carries away all loose dirt from the surface. It must be remembered that the sopping and smearing cannot remove gravel or dirt imbedded in the injured part. I cannot lay down a rule as to the exact temperature at which fomentation ought to be applied, as the nature of the disease and the part to be fomented must be considered. For the eye the temperature of the water should be about 100 degs., for strains and bruises as hot as the hand can bear, and for inflammation of bowels, pleuro-pneumonia, and other cases in which counter irritation is useful, the water must be scalding hot, the hands of those who wring out the cloths being protected by being wrapped in coarse towels. The chief disadvantage in the use of fomentation is the aptness to withdraw it before the heat and moisture have had time to do good, and the rapid cooling of the part by evaporation and contact with the cold air. Therefore, after the operation is over the parts should be rubbed dry, and well clothed or covered, to prevent the rapid diminution of temperature which ensues from evaporation. Some gentlemen use a fomenting pail, which I have seen of much service where the limbs require a long continued fomentation. It was made with a double bottom, and of sufficient depth to admit the horse's leg up to or beyond the knee. Blistering is a stable duty so clumsily performed that the efficiency of the application is almost lost or rendered inactive. When a cantharidine application is used, cut off the hair as closely as possible, and rub the ointment in with the hand for ten minutes, leaving a good quantity smeared over the surface afterwards. If the legs are to be blistered let the heels be protected, by being smeared with lard, which will keep the action of the blister

confined to the part requiring it; keep the head tied up, and put a cradle on the neck. Let the bedding be of short litter or saw-dust; do not let the horse stand on the bare pavement, as the irritation and pain the ointment produces may make him jar his feet and legs by stamping. After a week a little neat's foot oil may be smeared over the part with a feather to keep the scales moist. In using the Scarlet Biniodide of Mercury ointment, care must be taken not to remove the hair, as when ordinary blisters are used; the ointment should be rubbed into the part for two or three minutes, and the horse's head tied up until the irritation is subsided, and a little may be smeared over the part on the second day very lightly, without disturbing the scaly secretion, which after some days will fall off, and then the part may be dressed over again if it requires it. With reference to nursing, I would say that to nurse a horse properly after an attack of any debilitating disease, is one of the offices owners of horses are called upon to superintend, and the way in which this is carried out exerts an influence, greater for good or evil, than is often understood. It is not so much the care which is taken as the knowledge which directs it, which has a successful issue, the care may be ill directed and leave no good result, but the nursing carried on with judgment will have the best effect. How often do our most eminent veterinary authors tell us that the treatment which follows after the more active symptoms are passed, consists more in the nursing than in the physic; for the medicines having done their part with a disease, what remains to be done is to give the body support, by proper nourishment, and help nature to repair the damage. After inflammation of the kidneys, scalded linseed and an occasional mash to which linseed has been added, will form the best food, and no water given without sufficient linseed added to make it slightly glutinous. After inflammation of the bowels, to give bran is a positive poison. Mashies are not to be thought of; hay tea well made, and thin gruel, about a pound of flour to a pail of boiling water, must be the diet and nourishment allowed the first day of or after recovery; next day, a feed of boiled roots, not allowing more than one-third the usual quantity, for the weakened state of the affected organs will not allow of large quantities of food being taken at a time; after this a few crushed and scalded oats may be given but it must be some days before a horse is put upon his regular diet, or permitted to eat hay. After bronchitis, the food should be thick gruel, no solids; avoid loading the stomach, give water with the chill off; let boiled roots or crushed and scalded oats be the earliest approach to natural diet, and when recovery is effected let all the hay be damped, for nothing is worse or more likely to irritate the highly sensitive bronchial coverings than dust from the hay. The nursing during or after inflammation of the lungs should be hay tea, with a little oatmeal boiled in it and strained, and as improvement goes on make the hay tea thicker, and add two pounds of boiled potatoes per day. When the appetite is eager for food, give a pint of crushed oats well scalded six times a day: do not overload the stomach, or allow a full meal. Let the rule during recovery from any of these debilitating diseases be little food and often, and what is given really good; do not stir a handful of flour or oatmeal into a pail of water, and call that gruel. Let the gruel be made with boiling water, in order that the starch in the oatmeal or flour may be liberated, and the gruel will thus be made not only more palatable but more nutritive and easy of digestion.

Mr. CORRANCE, M.P., the President, had a strong suspicion that the grooms and horsekeepers needed to be looked after, for he knew they would sometimes, to save themselves the trouble of giving the horses a feed every three or four or five hours, whichever the case might be, give the whole feed at one time, and nothing could be more prejudicial to a horse. He should also like to hear the opinion of practical men as to the proportions of corn and green stuff to be given at different times of the year. He further asked the reason why aloes were so prejudicial in the case of certain diseases as almost to amount to poison.

Mr. G. JEAFFRESON, with reference to Mr. Sutton's remark that a horse naturally predisposed to grease, if neglected for a few days, became an excellent patient for the veterinary surgeon, said it was generally understood that all that was wanted for a horse with a greasy heel was to use warm water and to dry properly afterwards, and there would be no need for a veterinary.

Mr. SUTTON said aloes to a mare in foal caused a constitutional upset, which would be exceedingly prejudicial. In bronchitis and influenza they lowered the animal when he ought to be supported by a stimulant.

The PRESIDENT asked whether that remark applied to any opening medicine?

Mr. SUTTON said no. There were aperients which were not such drastic purgatives as aloes.

Mr. G. GOODWYN said with reference to badly paved stables he knew it was the custom in many stables, instead of allowing the horses to stand on the ill-paved floors, to litter them from time to time on the ground and some of the most valuable manure was so made. He wanted to know whether the horse standing on wet litter in this way in the stable as well as in the yard, so that he was only off it when at work, tended to produce grease. He admitted that in many cases the floor was not what it ought to be, and was not sure that it would not be found so in his case, and the animals stood at great discomfort. He agreed with Mr. Sutton in the desirability of having a separate building in which to place animals which showed symptoms of disease. Mr. Sutton spoke of not using new oats till the March winds had blown over them. He had often heard the vaunted superiority of old oats, but never heard it so strongly put as by Mr. Sutton, and he asked him to explain whether oats should have the drying winds and frosts of winter to deprive them of certain qualities injurious to the horse. As to the chaff, he agreed that the custom had grown to have a great quantity cut at one time. Mr. Freeman, Mendlesham Hall, had told him he pursued that plan, and had it tightly trodden down with layers of salt, and so dealt with it kept quite sweet for almost any time. He also said he had it carefully sifted when he approached the bottom of the heap. With reference to the Suffolk horses not liking to be turned into paviers and rammers for the London stones, he should like to hear the opinion of Mr. Gray, who had the reputation of having as good horses and of having given and obtained as high prices as any one in the neighbourhood, whether it was owing to the artificial rearing of sires and dams. They all knew the completely artificial state in which of late years young horses were exhibited at agricultural shows. He should not like to say what per-centage of the foals supposed to be the best in the country had been spoilt by artificial forcing. He knew many gentlemen who had extraordinary animals and had refused to show them because in order to obtain prizes they must make them so fat, and they would rather be without the prize than spoil the animal for their future service. He appealed to Mr. Gray on that point. The chairman asked at what times horses might advantageously be taken to work, and no doubt all were anxious to begin to make use of the animals that cost a good deal to rear, and at two years old they would begin to put them to do something so as to earn their bread and cheese. He had no doubt many good horses were injured from too much work when young. Their owners began with the most philanthropic intentions, meaning to make two or three of them do only one horse's work; but there came a pinch when all were wanted and the resolution was broken. He had known gentlemen who breed mares at two years old and turn them off in their third year with their foals.

Mr. SUTTON said the effect of standing on wet dung was to produce thrush. When, speaking of oats, he said the March winds should have blown over them, he did not mean that the wind should actually have blown upon them, but that they should have been kept for that period.

Mr. GRAY said he could not keep his horses as Mr. Sutton had described. He could not keep the feet as Mr. Sutton advised—not too dry or too wet. His stable was cleaned out every day and the tile floor was very uneven, but he never had a horse injured from it. His stable was a very moderate one, and as to ventilation he did not think it required it at all. He never had a horse go blind or have the staring coat Mr. Sutton spoke of as arising from the want of ventilation. As to the feet, if they were allowed to grow as Mr. Sutton described they would get so broad that they could not get into the furrow when at plough. What he liked to see was a horse with a round foot, and liked to see the shoe kept as back as they could to avoid straining the sinews. When a foot ran out the blacksmith shod accordingly and it was to prevent this that he would have it cut to the proper round shape. As to not

touching the frog, he liked to see a foot properly trimmed, and he never had a lame horse and never knew but they could walk the roads, and he thought they would go over the London stones if they were there.

Mr. SUTTON said he did not say they were not to cut the hoof; he only said they should not let the blacksmith rasp away the external crust and covering of the hoof, and that they should not let him meddle with the frog if he was going to take away the very covering nature had designed to protect the foot.

Mr. GRAY: I thought you said you should never touch the sole.

Mr. SUTTON said it should not be pared away with a knife as some blacksmiths did to fit the foot to the shoe instead of fitting the shoe to the foot.

Mr. GOODWYN asked whether the practice followed in many stables of watering the horses' baits was advantageous, and for what reason?

Mr. SUTTON said it tended to render the food easy of digestion.

Mr. T. CRACKNELL said he lost a valuable mare entirely, he believed, because his man neglected to water her food. He asked Mr. Sutton's opinion as to the advisability of giving horses beet-root. He had just begun to give his horses about half-a-peck a day, and thought it a good thing. They did not make 2d. a-bushel of the beet given to bullocks, and he thought they would make 3d. by giving it to horses.

Mr. JEAFFRESON asked whether maize was good food for horses.

Mr. SUTTON, expecting the question to be asked, had prepared to answer it. Maize had long been used in America as the ordinary food of horses, and it was said to suit them well. Bracey Clarke, and other writers of his day said it clogged the stomach and tended to promote founder. Others said they had seen horses employed for road work fed on it for years without ill effects. A member of the farming committee of the American Institute said from 14lb. to 20lb. of Indian corn meal was sufficient for the daily ration of the omnibus horses of New York. The stage horses had cut hay and corn meal, wet and mixed in the proportion of 2lb. of meal to 1lb. of hay and a very small quantity of salt. It seemed generally accepted that horses might be kept doing hard but slow work upon hay and Indian corn meal. The price of Indian corn meal in this country was generally a trifle higher than that of the best English oats, and therefore unless it went much further it would be no economy to use it. As 14lb. to 20lb. would suffice for the hard working omnibus horses of New York, it followed that it must be economical if it could be made to answer the purpose equally well with English corn. Oats contained 45 of starch and sugar and 11 of fibrine as compared with 62 starch and sugar and 12 fibrine in Indian corn.

Mr. JEAFFRESON said the General Omnibus Company used Indian corn meal for the horses that did the slow mid-day journeys, but to those which took the first quick journeys they had to give oats and beans.

Mr. J. GARRARD referred to the difference in the value for feeding purposes of English and foreign oats, expressing his opinion that the latter were absolutely injurious to the horse.

Mr. P. READ said it had been stated that the value of a farmer's horses amounted to £3 an acre. That was one-third of his capital; and who had they to look after their horses? Had they the cleverest and sharpest people they could find? Certainly not. Nine out of ten farmers would not be told by their horsekeepers that there was anything amiss with a horse till the animal was nearly dead. The usual run of labourers had a great affection for the horses under their care, and they sometimes gave them all manner of queer things—drugs they got at the chemist's and herbs they gathered—unknown to their masters, not with the intention of doing them harm, but to make them look nice. Mr. Read further said he had very little confidence in the general run of village farriers to whom these valuable horses were entrusted when ill.

The PRESIDENT, referring to the allegation that the Suffolk horse's feet were too tender for London work, suggested that this arose from natural causes. The circumstances under which a certain breed of animals lived would naturally develop those things which became idiosyncrasies of that breed, and he suggested that the pastures of Suffolk were not suited to the growth of horn. Succulent pastures with moist bottoms

would be favourable to the growth of horn, and there were few such in Suffolk, the majority being hot and dry. To counteract this defect they should select for breeding the animals that showed the greatest natural disposition for the growth of horn, or should obtain it artificially by placing the foals in yards with soft, moist bottoms, and not allow them

always to be running on the hot, dry pastures. He strongly believed that by such means natural defects might be contended against, and by careful selection and attention to breeding they might almost always be overcome.

A vote of thanks was passed to Mr. Sutton, and the meeting ended.

THE LAVENHAM FARMERS' CLUB.

At the monthly meeting, Mr. William Biddell, Vice-president, in the chair, the subject of labourers' cottages stood in the name of Mr. F. T. Barkway.

The CHAIRMAN, in opening the proceedings, said the subject of labourers' cottages was one that the Club did well to discuss, because the time might come when the owners and occupiers of land might be compelled to provide a certain amount of cottage accommodation. It would, of course, be a great stretch of power to do so, but we saw Session after Session that we were made responsible for things people never even thought of years back. Facilities had now to be provided for the education of the lower classes, and it might be we should be compelled to look to their physical wants or deficiencies. The members of the Club could but feel deeply indebted to Mr. Barkway for undertaking to introduce the subject at so short a notice.

Mr. BARKWAY said that the remarks he intended to adduce would be taken chiefly from the report of the Commissioners appointed to inquire into the cottage accommodation of the English labourer, as he went on to argue that the majority of cottages that now existed in rural parishes were deficient in almost every requisite that should constitute a home for a Christian family in a civilised community. They were deficient in bedroom accommodation, few having three chambers, and in some parishes, the larger proportion, only one; they were deficient in drainage and sanitary arrangements; imperfectly supplied with water; such conveniences as they had were often so situated as to become nuisances; they were full enough of draught to generate any amount of rheumatism; and in many instances were lamentably dilapidated. Whilst great strides and improvements had been taken in almost everything during the last 30 years, yet the matter of accommodation for the labourer, excepting in isolated cases, had received little, if any attention. In some places, comfortable cottages had taken the places of miserable hovels, and a comfortable cottage seemed to act like a charm, improving the manners and habits immensely. In his opinion it tended more to improve the condition of the labourer than anything else, and if landlords did not get so much per-centage for the outlay, they would reap it in another and more satisfactory way, having men more equal to a hard day's work, there would be less sickness, and consequently less expense in the shape of poor-rates. Adverting to Lincolnshire, which he characterised as a new county, he described the vast improvements that had been effected of late, the land being brought under cultivation, and he said everything necessary had been provided for excepting the human machine, by whose labour all this change had been brought about. The labourer must find lodgings miles away from his work. The report of 1867, stated that there was an absence, not only of villages, but almost of cottages also, consequently the labourers were all congregated in larger towns. The same report stated that there were women as well as men who took an hour's walk twice a-day, starting in the dark, and returning in the dark, to obtain the privilege of selling a hard day's work for a shilling. He gave instances in which whole families were found huddled together in miserable hovels, long distances from their work. The Lincolnshire cottages, however, as a rule, were not altogether bad in quality, but the insufficiency in quantity was the cause of evils quite as destructive of home life, and perhaps more so, than anything else. Overcrowding was, of course, attended with the worst results, and the people would take lodgers. He instanced many cases of overcrowding; in one instance, the floor of a cottage being so packed with sleeping people, that it was almost impossible to open the door. In Norfolk, what had modern civilization done for the labourer? In that county of agricultural progress, the labourer's lot was worse

and worse. The several reports show the character of the cottages in certain localities, old, rotten, and shapeless, with thatched roofs and walls full of cracks and crannies. He gave some glaring instances of overcrowding, adding that he was sadly afraid that we, in the county of Suffolk, could not put in at all a better appearance. If time permitted, he could bring before the notice of the Club cases equally bad and horrifying. He might enumerate many instances of whole families sleeping in one room, consisting of father, mother, and six, seven, and even more children. Could we wonder that vice and immorality should stalk through the land? And could we wonder at the want of decency, morality, and virtue? What must be the state of health which this overcrowding brought on? It was easy to guess what was the state of the air in the room of a cottage where ten or eleven persons had slept, and it was a wonder that they breathed at all. With this state of things, we could not hope to have a healthy agricultural population. If these evils were mitigated, we should find the calls upon the rates diminished year by year, and the people, as they became better housed, would become more provident, more careful, and would endeavour to lay up for a rainy day. He felt that he could not omit one parish, which stood out nobly, and presented a pattern which other parishes might most beneficially imitate. He alluded to the parish of Shimpling, where, under the fostering care of the lady at Chadacre Hall, many cottages had been erected, giving a great air of neatness and comfort to the village; and had, at the same time, produced a corresponding amount of care and self-respect amongst the occupants of these comfortable homes. He wished there were more ladies like Miss Halifax willing and able to assist their poorer neighbours, and then the complaints constantly arising would in a few years disappear, and we should be tempted to exclaim, "Could such miserable hovels ever have existed as homes for honest, hardworking men?" Mr. Barkway then spoke of Nottinghamshire, Derbyshire, Shropshire, Herefordshire, Worcestershire, Warwickshire, and a host of other places, giving a vivid description of the cottages and the habits of the people; and, in the course of some remarks on pauperism, he said he found that the increase of pauperism in 1868 over that of 1867 was 54,619, and in 1869 over 1868 it was 36,963. The number of paupers chargeable to the poor-rates on January 1st, 1870, was 1,083,532, while their cost to the country amounted during 1869 to nearly £7,700,000. In conclusion, he said: The question of decent homes for the labouring classes cannot rest. It stops the way. Education itself is an impossibility, when the nursery from which the scholars are drawn is a school of vice—school and home in antagonism. The victory, if possible, to the former would be a doubtful gain; and, unless some stir be made, the Act for the promotion of national education will be largely inoperative, if it is not generally followed by some remedial measures for the improvement of the cottage homes in England. I would ask, who is responsible for this sad state of things? Are the people who are born with it, who are dragged up in it, who are debarred by ignorance and poverty and the iron chains of habit from getting out of it? No; every family in this land is responsible for it. Think not that our duty is done by merely enjoying the comforts of life, and shining like a bright, warm spot in the cold, cheerless desert of life. You know that home is the congenial soil of every virtue. You know that upon the condition of the homes of England everything depends—that if they are corrupt we shall surely sink, let our material prosperity be ever so great. Let us not rest then until this evil is put away from us, until at least it shall be a man's own fault if his home becomes the abode of sin and misery.

Mr. R. HAWKINS expressed his great regret that Mr. Barkway did not suggest a remedy for the deplorable state of things he had depicted as existing in the various counties of the kingdom, and said it was perhaps because he did not take his hearers into the more immediate neighbourhood, about which he must have had a more thorough knowledge. As to the cottage accommodation in this county generally, there was no doubt there might be serious deficiencies in certain localities, but he (Mr. Hawkins) thought that on the whole the labourers were better cared for than in very many counties. He did not recollect that there had been remedies suggested, but it had been said that this was a landlord's question. There was no doubt but that the owners of property were bound in justice to give the labourers that accommodation which was requisite for the locality in which they resided. The county of Norfolk had been instanced as being one with grave deficiencies in regard to cottage accommodation. The tenantry of the late Earl of Leicester—some of them had 5,000 or 6,000 acres each—required better accommodation, and the noble Earl most liberally offered to find bricks and mortar on receiving five per cent. And if other landlords would but act in the same way the wretched state of things described as existing in some counties would be obviated. The lower classes increased at a greater rate than any other, and this subject of deficient cottage accommodation had long been mooted, and why no remedy was provided was a most astonishing thing. The landlords knew they had a duty to perform in this respect, and arrangements could certainly be made in the letting of farms so that the required house accommodation for the poor would crop up easily and satisfactorily for all parties. Some of the difficulty arose in this way: certain individuals by industrious habits acquired a small capital, and they wished to retire. They bought a plot of ground, and where there was only accommodation for two cottages they placed six, and let them for a given sum of money. The question, as a whole, must be taken up by the landlords. The tenant farmers could not do so, for they were in one place one year and miles off the next. At the same time they would assist their landlords in every way in their power to make the requisite provision.

Mr. T. P. HITCHCOCK said Mr. Barkway had quoted largely from the Commissioner sent to inquire into the habitations of the poor. Did they inquire into the state of the labourers' dwellings in town?

Mr. BARKWAY: No.

Mr. HITCHCOCK said he did not understand why the Commissioners should not have looked into the dens of Liverpool, Manchester, and other large cities and towns. The fact was the Commissioners wrote their reports to order. They wrote them strong one way in order to obtain promotion. Dr. Fraser had been made Bishop of Manchester, and no doubt he wrote his reports to order. What was the object in view in having these reports written? It was with a view of legislation, and was it intended that the agricultural labourer should have equal comforts to the men who were better off? He did not wish it to be understood that he deprecated lodging the poor well, or that many of the houses were good enough, but what he spoke against was legislation for the purpose. We must compare the wages of these people, and why was it they did not earn better wages? Because they could not, inasmuch as they had to compete with the labourers of other countries. Having referred to what had been said as to the evil tendencies of overcrowding—in the course of which he instanced Ireland, where families had only a single room in a cabin, and where there were thousands of such cases as had been referred to, but those people were exceedingly chaste—he said, in regard to England, that if it was legislated that there should not be less than three sleeping rooms, it must also be provided that there should be no lodgers, for if not, with this number of rooms, these people would be sure to take in lodgers. Mr. Hawkins had hinted that the population had increased, and that there ought to be more and better houses provided. Was Mildenhall larger than it was 100 years ago? Was Lavenham more thickly populated than then, as well as many other places that might be named? The population in many of these places had decreased.

The CHAIRMAN: In many of the rural districts it has decreased.

Mr. HITCHCOCK said he should like to see good houses provided, but let us have no legislation on the subject. It must be left to the good spirit existing between the landlord,

the farmer, and the labourer. If some inducement could be offered to the landlord to build the houses well, and good; but in the meantime he would caution persons not to exaggerate the case. It must not be forgotten that you could not, from a variety of circumstances, make all people live in good houses alike. The agricultural horse that was turned out at night into the straw yard might as well grumble because it was not kept up as well as the racehorse at Newmarket. It was quite right to ventilate the subject in this way, but it must be borne in mind that before much could be done there must be some return for the money. He, however, did not like those things written to order, because they only gave one side.

Mr. BARKWAY said Mr. Hawkins had asked for a remedy, and he could not do better than refer that gentleman to what had been done at Shimpling. Mr. Barkway also alluded to what Mr. J. E. Wright, Mr. Mumford, Mr. Hustler and others had done, and the comfort, and neatness, and alteration in the habits that these improved cottages had produced in the people was remarkable. As to the cottages in that neighbourhood it was, of course, easy to point to some that were as bad as could be, and as to Mr. Hitchcock's remark about the reports being written to order, it was hardly likely that gentlemen like those would write anything wrong in order to claim power upon it.

Mr. J. E. WRIGHT said he had done a little in cottage building, but he did not find it very profitable. His opinion was that each landlord or farmer must take his own special circumstances into consideration. It was impossible to lay down a general rule, because various persons' circumstances varied considerably. He himself had only found an indirect benefit. He did not find anything like 5 per cent. profit, but there was perhaps an indirect benefit in having the cottages close by. Living, however, as he did near Lavenham, there was not the necessity for cottage building which existed in some places. Mr. Barkway had referred to what had been done at Shimpling. Miss Halifax had no doubt taken a great deal of interest in the subject, and had spent a large amount of money. There were many others who felt equally well disposed towards the labourer, but it was not everybody who had Miss Halifax's purse. With reference to the per-centage question, that if that was thought of another class of persons must be found to inhabit the cottages.

Mr. HAWKINS said that the late Earl of Leicester built some excellent cottages with good-sized rooms above and below, kitchen, bake-office, &c., and every convenience for a family, and the tenant farmer paid £5 rental.

The CHAIRMAN inquired who bore the direct loss, the landlord or the tenant?

Mr. HAWKINS said the tenant farmers paid the rent. There was no loss.

The CHAIRMAN: Did the tenants pay the £5?

Mr. HAWKINS: Yes.

Mr. BARKWAY: If the same kind of cottage was built here, could you find men to pay £5 rental?

Several members said they wished they could, and one remarked that there was not a tenant farmer who, if he had a good man in his employ, would not make a little sacrifice with a view to that man's welfare.

Mr. THOMAS P. HITCHCOCK observed that one important question was whether it would suit the landlord's purpose to make an outlay in order that he might receive the sum which had been named. Every case must, of course, be dealt with on its own bottom; it was impossible to lay down a broad general principle. It would not answer the tenant's or the landlord's purpose to find cottages for some other person's labourers to live in.

Mr. BOWEN, as a native of Norfolk, was able to say that there had been great improvement in that county within the last few years.

Mr. TALBOT agreed with Mr. Hitchcock that the evil was gradually being remedied, and in support of this view he pointed to a number of excellent cottages which had been built within a few miles of Lavenham during the last three or four years. The Marquis of Bristol had paid particular attention to the housing of the labouring class. He also added his testimony to the liberality of Miss Halifax, and said it would be well if every parish possessed a lady of equal benevolence.

The CHAIRMAN said that few, if any, would deny that the labourers ought to have better cottages; but when it was

seen that a certain thing ought to be done, we should know on whom rested the blame if it was not done. He thought they were apt to talk as if the landlords should do everything. We found this sort of thing in every class. Take the case of a happy yeoman, or of one who farmed his own land, he could get an abundance of labour at a low rate without building cottages, and if he looked at the question in a business-like light, he would never build them. How had this yeoman, for instance, been treated by the Legislature or by the country? The legislator had told him clearly that "You must buy in the cheapest market and sell in the dearest, for that is the maxim on which we mean to go to work. We don't buy of you because your labourers have a little meat, and another man's labourers have no meat; we buy it of him if we can get it cheaper." If a man bought an estate for £10,000, and sold it, and put the money into the funds, there was no doubt but that that person was equally bound to see after the poor of this kingdom as when he was the owner of the estate in land worth £10,000. Why was the landowner to bear the brunt in this matter? We were too apt to speak of landowners as rolling in wealth, and as having at command almost any amount of money. No doubt numbers of the landowners had a great difficulty in maintaining their position, as many others, and we often laboured under a great mistake when we said the landowners had money in almost unlimited amounts. Mr. Barkway had most effectively portrayed the evils under which the labouring classes suffered in not having sufficient house accommodation. His (the chairman's) opinion was that those evils were greatly exaggerated. At the same time there could be no doubt but that the evils arising from unsuitable dwellings were very great. Very few things, doubtless, were more uncomfortable than a strong draught, a small fire, and low diet; but when we considered the habits of the labouring classes, he was not quite so sure, all other circumstances considered, that these draughts were entirely against their physical well-being, and it was quite possible that if they had air-tight windows it might prove, instead of a blessing, a serious evil; and though this state of things might be exceedingly uncomfortable for the time being, yet he did not consider them altogether unmitigated evils. Mr. Barkway had named many counties which were as badly, if not worse off, than we were in Suffolk in the matter of cottage accommodation. Human nature was such that if we could find others as bad as ourselves, the knowledge of this fact produced a certain amount of comfort. It was somewhat difficult to understand why this should be, but such was the case. It ought not to be a consolation to us, but it was clear that there were many other places even worse off than Suffolk. We must have all been con-

vinced of the fact that in Suffolk the dwellings were anything but first-rate. We found as great, if not greater, intelligence amongst the fens and uplands of Lincolnshire, for instance, as we did amongst our own labouring classes in Suffolk, and the habitations of the former, bad as they were, did not appear to have seriously affected their respectability or morality. The great point was the per-centage question. There were formerly objections raised against the inclosure of commons, for many small persons would get a piece of land, and somehow run a building upon it, and thus bring an additional encumbrance upon the parish. In some instances this had been the case, and you would find cottages of a certain kind built under circumstances which admitted of difficulties awkward to unravel. He would take the case of Cockfield, where there were some cottages built a short time since.

Mr. BARKWAY: They all tumbled down.

The CHAIRMAN continued: There were needy people who built good cottages, and who would not build them unless they got good cottagers. His own experience of cottages was that none but patriots would build them unless there was a special case where there was no accommodation for the labouring class, and those, of course, were places where cottages ought to be built. There was no doubt but that the dwellings of the poor had been very materially improved during the last ten or fifteen years. A certain Act of Parliament intended to act as an encouragement to cottage building proved to be one of great use—he alluded to the "Small Tenements Rating Act." The evils had been vividly portrayed, and he confessed he wished that the subject of the remedy had been gone into more fully. It was as well to ventilate the subject, and probably some remedial measures might eventually be suggested. Close by there had been some excellent labourers' cottages built. They were after the plans which obtained the £25 prize offered by the Suffolk Agricultural Society, and in the report of the committee appointed on the subject (a copy of which he held in his hand) would be found some most useful hints.

Mr. T. P. HITCHCOCK said Mr. Hustler had referred to the state of health of the agricultural labourer, and had given certain causes as having an injurious effect, bad dwellings, bad ventilation, and bad drainage; but he had not given any statistics showing the proportion of mortality in the agricultural and town districts, where there was better water and drainage. He (Mr. Hitchcock) believed it would be found, notwithstanding these advantages possessed in towns, that the average length of life was much greater than in towns.

Mr. BARKWAY replied, and a vote of thanks was passed to him for the paper which he had prepared at so short a notice.

AGRICULTURAL MATTERS IN ESSEX.

At the dinner of the Coggeshall Agricultural Society, Mr. T. S. Western in the chair, Mr. C. P. WOOD said: It might not be fair to give a verdict while the case was still pending, as the lawyers would say, but if he were bound to express an opinion upon the double-furrow ploughs he thought his verdict would hardly be favourable, as regards the soil of this district, but at the same time he should be glad to give the prisoner the benefit of the doubt. He was somewhat fearful, and he believed every agriculturist would share the same doubt, as to the possibility of managing wheels upon sticky soils under some circumstances. The benefit to be derived from their use might or might not be very great, but if it were the former he was sure they would all heartily welcome anything likely to improve the somewhat doubtful prosperity of the British farmer. Turning to the question of labourers' dwellings, which was very dear to him, he said he was quite inclined to believe that if they improved the dwellings of the poor they would improve their health, prosperity, and morality also. And he very much doubted whether they could dissociate the question of education, and the improvement of labourers' dwelling-houses. He was not speaking of that of which he did not know something, and if they would only turn their minds to one branch of the subject alone, leaving for the present all other consider-

ations, they would see that ventilation and pure air were almost as good as food. But they had not only the question of health but the larger question of morality involved in overcrowding. The conditions of the labourers are often found to be that he had too few rooms and too many children. And that was a subject which very likely applied as much to the landlord of the soil as to themselves. They could hardly expect landlords to find good houses for their labourers out of a feeling of kindness towards the poor. But they might hope that some time or other landlords would be found willing to expend their capital on improved dwellings for the poor when a scheme was propounded for guaranteeing the rents of these cottages to the landlord. He should say that if he were a tenant farmer and had a landlord who could build good houses for the habitations of the poor with the proper amount of garden ground, such as he thought every man was entitled to, he should be very happy to guarantee to such landlord a fair per centage of his outlay, if the landlord allowed him to find the tenants, and he would at the same time so bind himself down that he could not take any tyrannical advantage of his position.

The CHAIRMAN: Allow no lodgers.

Mr. WOOD replied he would have no over-crowding from any cause.

Mr. BAKER, one of the judges, said in regard to double-ploughing, as to which he had been asked for his opinion, he said he felt a little delicacy in expressing that opinion. He had a decided opinion of his own, but still he thought they had seen too little of the implements yet to express that opinion with fairness. At Colne he had his doubts as to whether they would be adapted to heavy sticky lands, and they had had that kind of land to contend with that day.

Mr. DENNIS then said he had the permission of the chairman to propose the health of a gentleman who was well-known not only at Coggeshall but throughout the agricultural world, a gentleman who was not only a practical but a scientific farmer, and from whom, let the world say what it liked about him, they had learned many valuable lessons. He need not say he alluded to their worthy friend, Mr. Mechi—who had attended these meetings for many years, and who, he thought he had heard say, always breathed freely at Coggeshall. There were some farmers who thought that Mr. Mechi, because he grew such great crops, rather threw the hatchet (laughter), but a little consideration would show that there was a sufficient reason for those large crops. In the first place Mr. Mechi's land was all drained, he had no fences, and very few ditches, and he had no game.

The CHAIRMAN: Oh, has he not, indeed? (A laugh).

Mr. DENNIS continued: He never heard that Mr. Mechi had much game. On the other hand some farmers had 20 or 30 per cent. of their land wasted in hedges and ditches, and therefore it was impossible for them to compete with him. Then, again, Mr. Mechi was a very high farmer—he “sugars” almost at every crop (laughter). And if other people did not grow such large crops they did not go to the same expense. He hoped that from Mr. Mechi they would that evening get as much information as would pay for their day's work, and their dinner, and wine into the bargain (renewed laughter). There was one point he wished Mr. Mechi to discuss before them, and therefore he would throw it down for discussion. Many of them were in the habit of grazing 40 or 50 bullocks every year, and they found by the time they had paid for the artificial food or corn they consumed they had nothing left for root crops. Whereas if the root crops had been used for feeding sheep they would have had a good profit. He wished to know Mr. Mechi's opinion as to the best and most economical method of converting straw into manure. Before sitting down Mr. Dennis said he wished to remark in reference to the labouring classes that they were not paid as much for their work as they ought to be.

Mr. MECCHI said one reason for the great success which had attended the operations of that society was that of all the years he had been among them nothing of a personal nature had ever been manifested at any of these meetings (Hear, hear). They had had discussions, and talked freely upon principles and practices, but had never descended to personalities. He trusted that the same features would characterise their future operations, and then he had faith in their prosperity, for personalities had destroyed many good societies in this county. He was particularly pleased, although farming was such an unprofitable business, to hear from Mr. Moss of the enormous number and size of the stacks which the judges had to inspect in performing their work. It was really reassuring, for sometimes they sowed so much grain that there was a fear of the people coming to “short commons.” The question of education, which had been alluded to, was a most important one to the agriculturists, because in these days of intelligence agriculture must be improved, and it could only be improved by the application of science, and in order to understand science in its bearing upon agriculture both their labourers and themselves must be educated. Science had done wondrous things in providing us with comforts. We saw its effects in the modern match-box compared with the ancient tinder-box; and in fifty miles an hour locomotive in comparison with the old mode of travelling, and we might trace it further through all the magical effects of chemistry. This led him to speak of one subject which was likely now to come before them in the application of science to agriculture. He adverted to the growing practice of making mangel cake, so that they could go to market and buy mangel cake just as they now bought rape cake. This had resulted from the recommendation of a gentleman, that of drying mangel after pulping. Mr. Coleman had carried out the process at his large works at Norwich, and had pressed the mangel into cake after

drying and pulping. Mangels, as now used, were very often the farmers great enemy. Many animals were either scoured or otherwise injured, and sometimes destroyed by incautious use of mangels. They all knew there were very essential qualities in the mangel, but the manner and time of its administration often made it very dangerous. Under the new method of seeing it it might be immediately given in any reasonable quantity, and the best results were expected to ensue from this improved method of treating it. It would be most useful to farmers. At the beet-root sugar manufactory at Lavenham there were four sets of men working during the twenty-four hours to convert the beet-root into sugar before Christmas, because they knew—and the same principle applied to mangels—that when it began to shoot the sugar escaped, and it did not answer the purpose, neither did it pay them to let the process of sprouting, with which they were all familiar, go on. Under the present plan, if they kept their mangel until July, there was a great deal of sprouting went on, and a great deal of emptying the farmers' profits, but it was done with the view of rendering the food rather more agreeable to the animals. But if they were pulped and dried they might be preserved in cakes for a year or two, and would retain all their good properties without their bad ones. He had some which had been stowed away for two years, and it was as sweet now as it was on the first day. He mentioned this as a scientific improvement in agriculture, and because it opened up the question of whether they should get their mangels at 7s. a ton, or pay 15s. or 28s. a ton for it. It would be a very important matter if they could multiply the mangel crop by 30 or 40 per cent. He urged the importance of investing more capital per acre upon their farms, and speaking with regard to stock, repeated what he had often said before, that if they were to make bullocks and sheep pay, they must keep them in covered yards, where all their food could be served out to them, without letting a particle of manure escape. He spoke on this point from many years' experience, during which he had probably never received less than an average of £5 per acre for each crop grown and consumed upon the farm in that way. Mr. Mechi excused himself from speaking longer, and resumed his seat amid plaudits.

The CHAIRMAN: Gentlemen, we are met here for practical purposes, so may I be allowed to ask Mr. Mechi what his opinion is upon the double-furrow ploughing which has been introduced upon the field for the first time at Coggeshall, what his calculations are upon the advantages of steam machinery; and last, but not least, what he thinks would be the expense saved to farmers generally by the cultivation of the soil by steam machinery?

Mr. MECCHI: These questions, gentlemen, are each of them very large. My experience of the double-furrow plough is not sufficient for me to form an opinion upon its merits. I am very much inclined to think that any ploughs encumbered with wheels on our stiff tenacious soils in certain seasons would be practically unavailable. In regard to steam, I would say, as a general rule, never use a man where you can use a horse, because he costs no more to keep, and is eight times as strong; and never use a horse where you can use a steam engine. The question of steam cultivation is an exceedingly wide one. I could go pretty generally into it, but you must excuse me doing so this evening.

The CHAIRMAN: Mr. Mechi has lately been giving his opinion upon the relative value of large and small occupations. We should like him to give his opinion upon that question to-night.

Mr. MECCHI: I can only say that that is a very difficult question to deal with. I should say, fit your farm to your capital.

Mr. CATCHPOOL said: It was, however, no use to build labourers new cottages unless they had a good supply of water. There were no less than eight or nine cottages near him which he supplied with water, because they had no supply connected with the houses. He had himself put down three or four pumps for his own cottages, and he believed he had been repaid by the improved health of his labourers in consequence.

Mr. WARDELL said he had no doubt they would conclude that he was speaking from interested motives when he told them that all the remarks made that evening about the double-furrow ploughs had been wrong. It was not the first time they had been tried on heavy land. They had been tried with great success at Alford, under the supervision of Mr. Amos, the

engineer to the Royal Agricultural Society. In the field that day the dynamometer had proved that the double plough showed only a draft of $5\frac{1}{2}$ cwt., while the single plough had registered $4\frac{1}{2}$ cwt., so that the double plough did double the work with only one cwt. more in draft. The double-furrow plough would save the farmer a horse and a man, and enable him at any time to plough a few acres with ease just after harvest. He confessed he was astonished to find in the liberal county of Essex so much conservatism in regard to ploughs. They held on to the old ploughs, which would not be tolerated in Beds or Bucks, and he did not believe they would long be endured here.

Mr. PEACOCK thanked the committee for affording the farmers of that district an opportunity of witnessing the double and single ploughs at work side by side, and expressing his regret that on this as upon other occasions they had not been able to show the thorough supremacy of the former over the latter. It was acknowledged, however, that the wet weather was much against all ploughing, and he could safely assert that in dry weather the double plough would beat the single

plough hollow, and he believed that even that day the double-furrow plough had done far better than had been expected of it.

Mr. EMSON said he had been very much pleased with what he had witnessed that day, for he must say that never in his life had he seen the whole of 30 acres of land ploughed in better style than it had been done at Feering Bury. This was not the first time he had seen double-furrow ploughs at work. At Halsted the other week they did their work very well, and at Earl's Colne just previously they were more successful than they had been that day, probably owing to the unfavourable circumstances over which the men entrusted with the ploughs had no control. In his opinion the use of steam ploughing did not increase much in this neighbourhood, but it struck him that the two firms represented that night had hit upon the right idea in perfecting these double-furrow ploughs, for something was really needed between the single plough and the steam plough more suitable to the general body of middle-class farmers, and he believed these ploughs would in time supply that want.

THE WIGTON FARMERS' CLUB.

TURNIPS AND MANGOLD WURZEL.

At the November meeting of the Club, Mr. Foster, of Killhow, in the chair, there were laid on the table some specimens of the roots on which Mr. Todd was to lecture; two of the mangolds weighed respectively 15 lbs. and $16\frac{1}{2}$ lbs., while a turnip and two beets were in proportion.

Mr. TODD read as follows: It is only after repeated solicitations—knowing my inability to do so satisfactorily—that I attempt to introduce a subject to this club. Taking green crops generally as the subject would have embraced too much for one meeting. I would, therefore, only consider the growing of turnips and mangold wurzel, having been pretty successful in growing good crops of both, without any failures, for several years. It would perhaps have been better if this subject had been introduced a few weeks earlier, as by far the most general system of growing root crops is after a crop of oats; and I consider that to cultivate these crops with the best chance of success, we ought to commence with the preparation of the land—the oat stubble—immediately after harvest, as soon as ever the oats are out of the field, so that we are more likely to get the land properly worked while the weather is dry. The best way in my opinion is to plough the land over first, then apply lime. One who is considered a good authority says: "Lime is found to act in a very remarkable degree on the turnip crop. Land that has never been limed, or which has not been so for a great number of years, either refuses to grow turnips, or if they do grow, they are always sadly injured ultimately by the disease called 'fingers and toes.' We have seen so many instances of this disease being removed by lime that we cannot look upon it in any other light than as a sovereign specific remedy in all cases of the same nature. We may, no doubt, reproduce the finger and toe disease by a too frequent repetition of turnips on the same field, even although recently limed; but had it not been limed the disease would have been much more virulent. The Norfolk system of cropping, where turnips are repeated every fourth year, would undoubtedly cause a total destruction of the crop, were it not for the long-continued custom of marling frequently, the consequence of which is that turnips are not more liable to disease in Norfolk than in other counties, where this crop does not recur oftener than every fifth or sixth year." Another states that "the soils most liable to this disease are those of a soft, black, or moory nature; and as lime can be only sparingly used upon such land, the only other cure is a long rotation, which embraces several years of pasture grass." The lime might be laid down in cartloads and slaked ready to put on the land as soon as it is ploughed over, then harrow it in, and with two or three times grubbing, and as many harrowings, it gets well mixed with the soil, to get cooled before the spring; now clear the land of couch-grass and other weeds which will all be brought to the top by the above operations, and if rather lumpy still, the best thing to run over

it then is the chain-harrow, which will thoroughly separate all the weeds from the soil, and leave them loose and light on the top of the land, to be carted away, burned on the land, or ploughed in to rot in the land during winter. On sandy or gravelly soils, where we are most likely to fail during a dry summer, a covering of clay on such soils occasionally would be the greatest improvement, if it can be found at not too great a distance. For light peaty soils anything heavier, sandy clay would be best. The land should be ploughed again before winter if the weather will admit of it being properly done, to have it thoroughly loose and clean, so as to require only one ploughing in the spring. A good deal of our success depends on the land being thus prepared in the autumn. The land receives much benefit by thus laying light and loose over the winter, and will be ready for stitching for green crop after one deep ploughing as soon as the land is dry enough in the spring, about the first or second week in April. Then after making the stitches or drills, putting in the manure (which ought to be broken very fine) and splitting the stitches to cover it in, the land is ready for the seed, and is no worse for laying a week in that state before the seed is sown, except on very stiff land. Mangolds ought to be sown during the last ten days of April, or first week of May. The late Mr. Rigg, of Abbey House, who was a very successful turnip grower, found that the 25th of May was about the best time to sow swedes, in his day, but that is three weeks too late in our time generally; of course there is a difference of seasons. The first week in June is about the time to sow common turnips. The drill ought to follow close after the plough in dry weather while there is moisture in the land. Get the land ready early for the seed, and if it should happen to be too dry, with most kinds of soil, we can wait a few days until rain comes. Turnips often miss or fail on account of the land not being sufficiently rolled and pressed down, and mangolds from the same cause. Where farm yard manure is used, particularly, the stitches ought to be well rolled and flattened down when the seed is sown at a dry time. The kind of seed drills with hollowed rollers are not the best kind. Neither is it good to sow without rolling at all. A light horse roller which rolls two ridges or stitches at a time with a drill held by a man attached to it behind, is the best kind. The roller passes once over the ridge before and once after the seed is sown. Sown in this way there is more moisture. Insects cannot work so easily in the soil, and the plants come up stronger. There is a field I have passed frequently this summer in coming to Wigton, of 3 or 4 acres, with only 3 or 4 cartloads of turnips in the whole field. But in going to Dumfries show this summer, I saw that turnips were much worse in the south of Scotland generally than in Cumberland. In some fields a fourth of the field was bare, and in others one-half. On certain patches of the field there are small worms at the root of the plant; you

see the leaves begin to wither; then come the farmer's friends to destroy the worms and insects, and pull up those turnips which had begun to wither and die; and thus a good deal of ground is yearly cleared. Occasionally we see failure from taking turnips too frequently off the same land, particularly if it is a light, poor soil. Land is liable to be turnip sick as well as clover sick. Sometimes the seeds do not germinate on account of the dryness of the season; there is not sufficient moisture in the ground, or, they may be growing healthy and well, and all be destroyed by the beetle or flea. Now, in my humble opinion, it is generally our own mismanagement in one way or another when we fail to get a crop, or to get the land clean. I have heard farmers say: "We can never get the land clean for potatoes or Swedes—they have to be put in so early." But the land ought to be prepared in September and October, and for that purpose we should keep up our strength of men and horses after harvest, and not have the land to clean in the spring when the seed should be sown. We ought to grow more mangolds than we do. With proper management and good seed, we may grow as heavy a crop of them, or nearly, as of turnips of any kind. We know they are not so likely to be destroyed by the flea. They will keep longer, and remain juicy and palatable long after the Swedish turnip has become spoiled by age. Turnips should all be used by about the middle of March; and we ought to have plenty of mangold wurzel to use with dry fodder in the last two months of spring, before the cattle are turned out to grass; and swedes are not likely to be either destroyed by the flea, by worms, by birds, or anything else, if sown early—sown in the first or second week of May. Why should we be sowing them during the last ten days of May, when they have the most enemies to contend with, and there is most risk? But if we should have to sow a part then, during that time when the flea is strongest, it will be necessary to sow a pound more seed—at least 3 lbs. per acre; and to dust the land over with lime just at the time the turnips are coming through. A small addition in the quantity of seed at such a time has sometimes made all the difference between a good crop and no crop at all. Common turnips may be sown up to the 20th of June, but should seldom be sown later. We should always sow a small portion of the soft globe turnip, to be used first in the autumn, to be given to young cattle to teach them to break turnips for themselves. A thing of the most importance is to get good seed. If we cannot purchase good seed, would it not be better to raise our own? A small portion of my swede crop this year is from 1 lb. of seed procured from a seedsman, at 1s. per lb. All the rest is from a farmer who raises his own from transplanted bulbs, and sells a quantity, the price paid for it was 2s. per lb. They seem to be both of the same kind of turnip; are the same colour; and the same shape of bulb. Any one walking across the field could not see a very perceptible difference. He could not easily tell where the one ended and the other began. Yet there is a difference of probably 4 or 5 tons per acre. Better to pay half-a-crown per lb. to have it from selected transplanted bulbs, than one shilling per lb. for seed grown from the promiscuous crop. We are told there is little profit to the grower who sells it thus raised at 2s., but that it pays well to sell it at 2s. 6d. per lb. We can generally procure good swede-seed so grown; but the yellow bullock, which was once a great favourite and valuable root, is now so degenerated that if seed growers do not take more pains with it, or if it cannot be improved or restored, must either be very little grown or go out of cultivation altogether. I should like to see a few members of this club transplant a few bulbs in their gardens, of common turnips, and try to improve that kind; this is the time to do it. They ought to be put rather deeper in the soil than swedes; and it would be well to spread a little light manure over them to protect them from the frost. Those who are not in the habit of raising swede seed could best do this. They should not be grown near together, else the produce would be hybrids. To show the difference there is of seed, it is right to state that before I began to get mangold-wurzel seed from Mr. Thomas Mann, of Crockhurst, I never could grow crops of mangolds of above half the weight. At first, a few years ago, he gave me a small quantity which they had left after sowing their own. It was ready steeped, and was sufficient to sow one drill or stitch the length of a field where I that year had about two acres sown, the seed of which was from two different, but both respectable seedsmen. There was as great a weight on that

one stitch as on any two of the rest of the two acres, and all the same way managed. I have got seed from Mr. Mann, and grown heavy crops of mangolds ever since. This year I had 7 lbs. from him, and paid 2s. 6d. per lb. for it. That quantity was sown on nearly two acres of moss or bog land, with a proper mangold drill, on the first and third of May. The stitches were twice rolled, and being loose light moss was pressed down until the land was nearly level. Other years I have applied a little artificial manure, mixed with salt, along with farmyard manure. But this year I have used only a rather small quantity of very rich farmyard manure, without either salt, or artificial manure of any kind. The quantity, as near as I can tell, would be about 10 good cart-loads per acre. Each row was set for 5 stitches. The heaps were about 7 yards apart, and about 12 heaps in a cart-load. The land was limed and well cleaned in the autumn. We had two kinds sown—the long red, and the yellow globe. To ascertain the weights per acre, we carefully weighed, with the tops and tails on, but the soil clean washed off, 6 yards on a stitch of each kind where they seemed an average of the whole crop. Also, 6 yards off an extraordinary crop of swedes, grown on the same sort of soil in the same field, and managed in the same way. The long red mangold-wurzels were 8st. 2lbs., number of bulbs 21; yellow globe do., 7st. 9lb., number of bulbs 19; swedes 8st. 11lb., number of bulbs 21, each from stitches 6 yards in length, by 31 inches in breadth. The weights per statute acre weighed, on the 21st October:

	Tons.	Cwts.
Red mangold wurzel	47	13-3237
Yellow globe do.	44	14-7862
Swedes	51	8-5860

A few days afterwards, thinking it would be more satisfactory, we weighed the tops cut off 21 mangolds on a 6 yards length, and the tops off 21 swedes on a 6 yards length (all the tops cut off just a little above the point of insertion into the bulb) and found the weights to be as under:

Tops off 21 mangolds	16 lbs.
Tops off 21 swedes	5 lbs. 11 oz.

WEIGHT OF TOPS PER ACRE.

	Tons.	Cwts.
Mangolds	6	8-3248
Swedes	2	7-5344

WEIGHTS PER ACRE WITHOUT TOPS.

	Tons.	Cwts.
Red mangold wurzel	41	4-9989
Yellow globe do.....	38	6-4578
Swedes.....	49	1-0516

LONG RED MANGOLDS.

WEIGHTS (WITHOUT TOPS, AND CLEAN WASHED).

SWEDES.

49 1	8 11	21	5 13
------	------	----	------

When we succeed in growing a crop of mangolds to weigh upwards of 40 tons per acre, a few of them (the bulbs) will often be of this weight—15 and 16½ lbs. A good many of them will weigh half a stone, and very few of them will be under 3 or 4 lbs. What is the value of such a crop of swedes? To be sure we are within the actual weight; we will call them 40 tons. I think we may safely put them down at three farthings per stone, to use for our own stock; three farthings per stone, 6d. per cwt., 10s. per ton; then, £20 for an acre of swedes or mangolds weighing 40 tons. A writer, residing at Ipswich, Suffolk, in the *Royal Society's Journal*, in a prize essay, says—"In connection with a farmers' club we have often seen this crop weighed, and also swedes. We found beet to vary from 14 to 44 tons per acre, and swedes from 10 to 25 tons." Here the beet weighs 38 and 41 tons; but the swede, instead of being little more than half, weighs more than the beet. In the south of England there is an enormous advantage

on the side of the beet crop. Here, as regards weight, the advantage is slightly in favour of the swede; but the beet is more certain, and will keep longer. We had green top yellow bullock and white globe turnips in the same field, but it was easy to see that they were not so heavy as the swedes. Before we got any of the better mangold seed, the bulbs, although only about half the size, had more small fibres at the roots; brought up more soil with them when pulled; and far worse to clean. In thinning turnips and mangolds the best way is by hand, then to be hoed not many days afterwards, taking care not to take too much soil from the plants, or to let them too much down. Three lads may thin or hoe an acre in a day. The weight of the crop greatly depends on their being judiciously thinned. Don't mind for 2 or 3 inches either way, less or more, to leave the finest plant. The best average distance, for weight and quality, is for swedes 12, and common turnips 10 inches. Mangolds 10 to 12. The best width for the ridges or drills from 30 to 33 inches. When we pull and clean them for storing, that they may keep better, care should be taken not to cut into the bulbs, the tops should be cut off above the point of insertion into the bulb, so that the leaves fall separately on the ground, and are more easily ploughed in. It is very common to let the turnips to pull off. We see the people at work with them; one cut generally serves for the root, another for the top. They seldom strike more than twice when the work is let, and often cut into the bulb; and often leave a great deal of soil on it. The better way is to take the soil carefully off with the back of the knife, and then keeping the knife the same side up, pull it through the top from the underside at the exact place, without striking at it at all in cutting off the tops. In storing, it is better if they are carted and covered up on the same day that they are pulled, a single night's frost may damage them very much; but they receive little harm from two or three night's frost as long as the roots are in the ground. Mangold wurzel requires to be well covered up on the heaps, the way that we usually cover potatoes, with a little straw and a good thickness of soil. The expense of cultivating an acre of either, will often be from £8 to £9, for labour, manure, and rent of land; part of this expense for manure is chargeable to the next crop, particularly if the tops are ploughed in, and for cleaning upon all the crops; for the real cleaning crop in the rotation is the root crop. As it is an expensive crop, at any rate, it is better to be at a little extra expense for manure and labour to get a heavy crop, as the value of it may vary so much. We have seen some turnips this summer worth not more than five or six shillings per acre (in one case which I mentioned to you), and a good crop may be worth from 15 to 20 pounds. My reason for introducing this subject is on account of the many great failures we see in the turnip crop. We cannot travel 100 miles north or south without seeing scores of acres bare, which ought to be growing turnips. I trust that in discussing the subject such suggestions will be brought out as may be of benefit to us all.

Mr. GRAINGER was very glad to hear a practical subject treated in so practical a manner, as he agreed in the main with Mr. Todd's details. He had had the pleasure of examining Mr. Todd's extraordinary crops, which were probably not to be equalled in the kingdom, quality of soil and cost of manure considered. He flattered himself that he used to grow pretty good crops, but they had never exceeded 32 tons per acre, and he found himself very far behind when he saw Mr. Todd's. He approved of autumn cultivation, season and soil being suitable, with one deep ploughing before winter. He had copied remarks from the late Mr. Samuel Rigg, of Abbey House, a man to whom farmers owed much, and he had learned a great deal from the farmers in the neighbourhood of St. Bees and Whitehaven, where they produced excellent crops. In these localities a few years ago their stitches were 32 inches wide, and the plants were fourteen inches apart, but he thought the tendency at the present time was to lessen the distance between the stitches and the plants. As to the time of sowing, he recommended between the 10th and 20th of May. When earlier, the swedes were apt to mildew. He thought the next satisfactory plan of ascertaining the value of the turnip crop was by having them consumed by sheep, at so much per week. Mr. Grainger proceeded to enter into cal-

culations as to the value of a crop of turnips. He said, taking Mr. Todd's estimate of three farthings per stone, and supposing a sheep to consume a quarter of its weight per day, and assume further that two-thirds of its value is in the matter of improvement of the sheep, and one-third in the manuring of the land; in a crop weighing 15 tons we have £5 payable by owners of sheep, or improvement in sheep, and £2 10s. for manure. A crop of 20 tons they would have £6 13s. 8d. for the land; and in a crop of 30 tons they had £10 for improvement in the sheep, and £5 for manure on the land. Good seed was of the first importance. He had had prime turnip seed from Mr. Highfield, and from Mr. Mann, of Crockhurst. As to mangolds, he scarcely considered them to be suitable for this district, but the last three years had certainly been exceptional seasons. He considered salt very useful to apply to mangolds. Speaking of the distance to sow turnips, he said Mr. Todd gave 12 inches for swedes and 10 inches for common. Did Mr. Todd use any lime.

Mr. TODD said he did—a very little.

Mr. HAYTON said he had seen Mr. Todd's crops, and had been really astonished. The weight per acre was surprising, but he should have liked to see a greater length of stitch tried. When he looked at the sizes of the bulbs shown by Mr. Todd, and heard the weight per acre, he could not but think that they often under-estimated the weights of their turnip crops. He approved of autumn cultivation when it could be done.

Mr. NORMAN said he could only say he wished his mangolds were as good as Mr. Todd's. Mr. Todd had recommended lime, but lime did not suit all soils. He had tried it on some land at Oughterside, and it had not answered at all. Lime did not improve the land, it only stimulated it, and it was said that it enriched the father and impoverished the son. Lime set free a great quantity of moist manure, but for many soils they could apply as much as they wanted in the shape of bones. He should not like them to adopt the universal application of lime.

Mr. BARNES said he was very much against lime for mangolds, but for turnips he found it answer very well.

Mr. HORNE should have liked to hear something said about the storing of green crops, which was of great importance.

The CHAIRMAN, after complimenting Mr. Todd upon his paper, asked him if he manured in the autumn for his mangold crop; and Mr. Todd had not told them what kind of mangolds he used. Then he shook his faith in his hollow roller, which he had thought to be the best, especially for a dry season. For himself, he had always pursued the plan of autumn ploughing. He was not afraid of lime; he adopted the plan of giving his land 20 or 25 cart-loads of lime per acre once in 15 or 20 years. The Chairman proposed a vote of thanks to Mr. Todd for his paper, which was, he said, one of the best they had had read.

Mr. BROCKBANK seconded the motion, and asked Mr. Todd if the bulbs were 10 inches apart.

Mr. TODD, in returning thanks, said they were under 10 inches apart. In thinning his turnips he always took care to leave the finest plants, even if more or less than 10 inches. They would generally find the best plants where there were thick lots, and being careful in this they might make several tons in the acre difference in the yield. Twenty or thirty years ago he never could grow good crops of turnips, but having had much experience amongst the turnips in the west and other parts of the country as inspector of your crops, he had carefully studied the best methods of producing this valuable crop. He had grown some very heavy crops, and might say that it did not depend upon the land; such crops were fed from the atmosphere, and it depended almost altogether on judicious management. As to lime, he thought a little was always useful, but he was not an advocate for a heavy dose. As to manuring, he thought it was a good plan to apply part of it in the autumn, and the rest in the spring. As to a drill, he thought it was best in a dry season, when the plants were well pressed and rolled in, as they got more moisture. Mr. Todd said he should be very glad to show any of the members his crops, if they paid him a visit at any time, and invited as many as could come over to Mireside the following day. The meeting then broke up.

THE YORKSHIRE FAT STOCK SHOW AT YORK.

Is it a necessity that this show and the Smithfield Club Meeting should be held at the same time? If so, it is a necessity to be deplored; not that the Yorkshire Fat Show suffers so much by the drawing away of animals to Smithfield, as the county is a large one, and few wish to take an animal up to London and to sell it there without having a chance of being distinguished at home. The loss at this show is chiefly in the character of the attendance. Truly the citizens crowd in every afternoon, while the working people are in force every evening, and the farmers of the neighbourhood attend every day from noon to night; but still, the leading agriculturists of the county, residing at a distance from York, are conspicuous by their absence. The fact is they are in town, seeing the Club Show, spending the agricultural week, and listening to speeches in Club and Society, and they cannot be at York at the same time. The Smithfield Show suffers, on the other hand, by the simultaneous meetings, in its entries. How many good animals which we shall notice would have graced the Agricultural Hall under other circumstances. Some there are that would have taken the highest honours, and have certainly elevated the character of the Shorthorn show from mediocrity to a higher position. Lord Zetland's oxen, Sir Geo. Musgrave's heifer, and Mr. W. Hill's cow would have been no mean acquisitions to the Smithfield Club.

Any such unprofitable clash has not, however, prevented this the fourteenth meeting of the Yorkshire Fat Stock Society from being a success in every particular. The meeting opened on Tuesday afternoon, and on each day the attendance, in spite of the return of winter, was in excess of previous years. On the evening of Tuesday, the half-crown day, the county families and *élite* of the city and neighbourhood were present, and the scene became one of considerable interest from the large attendance of ladies in their gay winter costumes. The number of entries is larger than at any previous meeting during the last five years. The increase is principally in Shorthorns and sheep, while the other classes continue to be, in most instances, about the same in numbers.

Of the 115 entries of cattle 89 are Shorthorns, 10 cross-breeds, or of any breed (including several Shorthorns), and 16 Scotch breeds, and in this full entry there are very few inferior animals, while the competition, as a rule, has been very close. This has been the characteristic of the show: a strong class of really good animals, though we do not infer that none have reached over the average merit, but the contrary. Some animals are of extraordinary merit. In these we do not hesitate to place the winner of the President's Cup, and first prize in class 1 for best ox not exceeding four years old, and the second ox in the same class, both the property of the Earl of Zetland; as also the best cow of any age, the property of Mr. W. Hill, Wetherley, the winner of Beach's Cup, for best ox, cow or heifer, fed on his food, in which competition she came against the Earl of Zetland's first and second prize beasts; Sir George Musgrave's roan heifer, first in class 4, for Shorthorn heifers not exceeding four years, and winner of the Corporation Plate, £20, as the best cow or heifer in classes 3 and 4; and Mr. Reid's black polled cow, first in class 12, Scotch cows and heifers, and winner of Mr. Roper's £20 Champion Cup. Mr. H. S. Thompson's ox, winner in class 2 not exceeding three years old, and Mr.

Thornton's ox, winner in the class for Shorthorn ox of any age in the Tenant Farmers' Classes, are animals also of high merit; and there are several more which are entitled to their position, and to something more—public notice.

For convenience sake we shall, however, take these in their places. In the first class of four years old oxen the first and second prizes fell to the Earl of Zetland, for two magnificent roans; the second is the heavier animal, and of course, by "the trade," is viewed as the better; but fortunately the judges on this occasion—and how seldom it is so—were not governed by the scales. They could not ignore the first's superior quality and symmetry. Straight in all his lines, with handling hair unexceptional, magnificent crops, broad, deep breast, and fine head, he is every inch the model of a prize animal, and worthy of standing as the type of his class. His arched ribs and fine forequarters cannot be excelled, and make us regret that he has been prepared for the shambles rather than reserved for the herd. The want of arch in the fore rib is the characteristic and common *failing* of the Shorthorn, and the possession of a true cylindrical form is therefore a merit of the highest degree, and without it no animal, whatever other points he may have, can be an A. 1. Shorthorn. In this point the second prize ox is slightly defective, and though he will weigh perhaps 10 stone more than the first ox, he girths *three inches* less. Still he is also a grand ox: has size, colour, handling, and good form, with the exception of the point named. The whole of this class of oxen is good; the third prize white ox, belonging to Mr. McKessack, is a level good animal, very closely run by Mr. W. Hill's red-and-white ox. There is also a commended ox of Mr. Laycock, with a wonderful good loin and hind quarter.

In the young class of oxen, Mr. H. S. Thompson, the President, took the first prize with a red ox, wonderfully developed, for at his age we never met with such beef as he has upon him. It has been Mr. Thompson's specialty to bring out *young* oxen fat for the market, but on this occasion he has outdone himself, the present animal being quite equal in quality of beef to any four-years-old shown. Had he been a little more spread out, and stood better on his legs, he would have not been a long way off taking the President's Cup back again to Kirby Hall. The second-prize animal in this class is well entitled to his position; form and quality are united to the fullest extent, and his back and hind-quarters are exceptionally good. He is, however, a little light of bone, and there is not enough of him altogether to achieve first honours. Mr. Sharp, of Broughton, and Sir W. Trevelyan have good animals in this class, and Mr. Lisman, of Kimbolton, third prize is a thick well-developed animal, worthy of his place. Mr. Jordan's 2 yrs. 2 m. very young roan is not strong enough for a place; but by another day may see him in a higher position, for he is worth trying on. As in the previous class, there are here nine good animals.

The cows of any age "are seven," but select. Mr. W. Hill's white cow, the first prize and Myers' cup winner, is one of those sweet-looking females that are occasionally found in the highest class Shorthorns. She is an aristocratic beauty, graceful in outline, filled up evenly with flesh, showing no break of contour from irregular deposits of fat, with a head and eye as expressive as her figure is graceful, and she beats the large capital beef cow shown

by Mr. Darley, very properly. This cow is a fine specimen of the old Yorkshire Shorthorn, large and handsome, not patchy and lumpy, but she is wanting in the indications of *high caste*. She has weight in plenty; but when we have a cow that is equally fat, and has also other points of shape and quality in excess, in the class, fashion must have it. Mere bulk should not win against less weight, if the latter be accompanied by superior quality and form. We must confess, however, that we cannot see reason to place Mr. Hill's cow before Lord Zetland's ox, the winner of the President's Cup, and who competed for Beach's Cup. The award may be right, for between such animals it scarcely can be wrong, each being on the top of the ladder of merit, and it is quite possible that if we had counted the steps of the ladder along with the judges, we might have come to the same conclusion. Our own individual reckoning does not, however, set the lady above the gentleman in this case. Mr. Reid's third-prize cow in this class is but a moderate animal.

In the heifers under 4 yrs. old, there was some capital competition. There were eleven animals with more good entries than we have space to notice. Mr. Robson had a clever H. C. animal; Sir Chas. Trevelyan, a *petite* heifer 2 yrs. and 11 m., a perfect little gem, placed third, a place of honour indeed, in such a class. Mr. Tindall's second prize white heifer is a very great weight, and uniform in all her points, but quite out of the race in the struggle for first place with Sir G. Musgraves light roan heifer. This animal takes first prize here, and the £20 Coporation Plate, as the best animal in both the cow classes, therefore she beats Mr. W. Hill's cow, the conqueror of Lord Zetland's ox, for the Myers' Cup, and is entitled to be considered the pride of the show. Lord Zetland's ox goes to Leeds, but we do not know anything of the future doings of the cow and heifer; and it is not likely that if they all do go that they will compete together, or that we shall be able to get a *line* through one to the other as at York. The heifer in question is the best in a capital class, and is placed at York at the head of the females for the £20 time-piece given by the Corporation.

Cross-breed oxen are only few. Mr. Ross, Forres, has a blue roan of great length and size; with a marvellous loin, but the crop is light, and the top not straight. His beef is not exactly the thing, and he only just wins the first place from Sir W. Trevelyan's roan ox. This is nearly a Shorthorn, stands well up, is perfectly straight above and below, and nearer a parallelogram in outline than we often meet with; his flesh is well spread, and he walks a grandee; he has deep sides, and wide breast, but unfortunately his sides are too flat. Had the rib been more curved, he would have been an extraordinary fellow, as it is he is quite good enough to win. As regards the prize cows of Mr. Ross and Mr. Reid we are not impressed in favour of the "best." She is level beef, and heavier than Mr. Reid's cow, and her age is only 2 yrs. and 9 m.; weight for age is then really her title to honour. Mr. Reid's second prize is an animal of very fine bone, and has quality and capital form, but she is 8½ years old.

The tenant-farmers' Shorthorns are only four classes; that of oxen of any age, with ten entries. The first-prize animal here distances the lot; he was bred by Lord Zetland, and is shown by Mr. Thornton, his present owner. The winning animal in this class is a roan, displaying all the character of the pure-bred Shorthorn; quality is unexcelled, and his symmetry very good; he has wonderfully perfect crops and shoulder; and indeed, his fore-quarter cannot be beaten. He is far from being fed up; and he might be better on his hind legs, while his hind-quarter is a trifle short. The second animal here (Mr. Batram's) *has* size; any other merits we are ignorant of, and therefore, we

will leave his frailties unnoticed. The third prize is a young animal of fine touch and quality; he is only 2 yrs. and 9 m. old, and his owner, Mr. Brogden, will not, we think, lose sight of him for the future; he is straight and handsome, but scarcely, we think, good enough to beat Mr. Lovel's H. C. animal and some others of great weight and substance. In this instance the judges have given him full credit for the future, and it is not unfrequently that we are led away from the sober severity of justice in our decision by the attractions of youth and beauty.

The Tenants' Shorthorn cows of any age, are an excellent class in character, and five out of the eight exhibited are distinguished by the judges. The first-prize cow is a Shorthorn, bred by Mr. Unthank, and is a credit to her family. This is saying something for her. She is long and low, with fine bone, and comes luxuriously to the hand; while her head has more of the character of the Shorthorn than we can find in a day's journey. Mr. Thomlinson's roan heifer is well worthy of her second place. She is a good specimen of the quality and style of the heifers of the Bates' strain, but is a little too slight of bone and frame, to get a first at a fat show. The third prize is a strong fair Shorthorn; and the whole class is a satisfactory one.

For the best ox of any other breed, and the best cow or heifers of any other breed or cross, there was small competition, whether measured by numbers or by merit. In the Scotch breeds there are four classes only. For the best polled ox, Mr. Reid was first with a black animal—a solid lump of beef—and he is well matched by the second belonging to Mr. MacPherson. This animal has a finer point than the first animal, but his beef is also looser. In the polled cows or heifers, Mr. Reid takes the first prize and Mr. Roper's cup, which he now holds "for good," as he won it last year. To accomplish this second victory Mr. Reid has wisely brought a sure card, for a more perfect animal of her kind than she is would, we think, scarcely be found in all Scotland. The second and third animals are just fair animals of their class. In horned Highland oxen Sir W. Trevelyan is first, and Mr. Thackray, York, second; the first being a moderate animal and the second a "bad-un." Mr. Eastwood's Highland cow is of another order. Her hind-quarter is marvellous for a Highlander: her flesh is wonderful—elastic and full to the hand: her loin, indeed, is so wonderful, as to cover completely the space between rib and hip with an Indiarubber cushion. This makes the crops look rather light, but they are thickly covered with flesh. Sir W. Trevelyan stands second here with a pretty-topped heifer; and there is a good H. C. heifer belonging to Mr. Harrison, Skipton.

In the district prizes for tenant farmers within twenty miles there were only four animals for the ox of any breed. Mr. Lund, York, won this with a beast bred by Lord Zetland, and Mr. John Hill took second with fair butcher animals. The cow or heifer prizes went to moderate animals in a competition of six.

In sheep the entries exceed those of last year, but still they are not nearly as many as they ought to be, considering what extent of sheep country there is in Yorkshire. A few better prizes would bring this about. The present premiums offered are not equal to the occasion; and therefore they are inefficient in bringing numbers into the field. In Leicester wethers Mr. Jordan took all the honours. He exhibited three pens of fine sheep, but we are inclined to think that the judges here put the rosettes upon the wrong pens. The first prize was given to the biggest sheep on the leg; but they were inferior to the other pens in uniformity, quality, and wool. Now, in pens of animals uniformity is an essential, and the winning animals were not nearly as even as the second prize, or the

H. C. pen of sheep. The H. C. pen were real specimens of improved Leicesters; even as peas in size, and like each other in looks and wool, with thick necks, barrel middle, and fine bone—as a lot they excelled the first in everything except weight, and in this they were not short by many pounds. In Shortwools Lord Wenlock took all the prizes: they were fair individual animals, but did not in any case make a good pen—they wanted uniformity. For Scotch sheep Mr. Lund, of York, and Mr. W. Hill, Wetherby, both well-known exhibitors and in the trade, took first and second respectively with admirable specimens. The half-bred sheep were also good, Mr. Agar, York, scoring the win, and Mr. W. Hill again coming second. Mr. Borton's pen of fat ewes took the prize for best sheep of any age. We question that any other man in England can at this time produce such specimens as these. They show what his breeding-stock can do when put to feeding, and illustrate the fact of his great successes at the Royal Agricultural Society's Meetings as our leading Leicester ram breeder. We think that the cup for the best pen of sheep should have gone to Barton-le-street, or to Mr. Jordan for his pen of H. C. gimmers, rather than to Lord Wenlock's downs—themselves only moderate representatives of a class of sheep not cultivated at all in Yorkshire by the rent-paying farmer.

The pig competition in numbers is slightly larger than last year, and much greater than in previous shows. In excellence of the specimens it is quite equal to the usual standard. In Yorkshire this is always a high one, as, in addition to the public men in the line who compete at all the great shows, Yorkshire has also numbers of local breeders who come out on an occasion like the present, and bring out animals hitherto untried. In this instance it will be seen that many of the prizes are taken by residents in and near the city of York. Thus Mr. Agar, Brockfield, took first prize and cup for best animal, with a small-bred sow only fifteen months old. Our experience does not point to any better animal at her age than this. Mr. Routledge, York, also won first and second for best pig

under twelve months old; and Mr. Wm. Hill, Wetherby, took first for best three porker pigs under eighteen weeks old, with three black beauties—perfect piccannies, that could not be prettier, nor shine brighter, if they had been fed on sugar and milk since they came into this rough world! Mr. E. Duckering did not allow all the honours to remain in the county. He takes first, second, and third in class "pigs of large breed of any age." Oscar, the prize animal, is a grand specimen, weighing 70 stone alive, and will be nearly 60 stone dead weight. The second and third are two sows which have won in all parts of the world; but the third here, Princess Royal, has generally been placed before the second. They were so placed at the Yorkshire show at Wakefield in August last.

There is one speciality of this Fat Show which we do not often meet with. There are prizes offered for *young bulls* and *boars*. The bull classes were well filled. For "bull calf between six and twelve months old" Mr. Bromet, of Tadcaster, took first prize with a most promising calf of the Oxford and Duchess blood, Mr. Wright, of Oglethorpe, Tadcaster, coming second with another animal of the Wetherby blood. He has capital handling, and is a nice straight calf, but is slightly deficient on his sides. The year-old bulls were a large show; Lord Irwin, of Royal and Yorkshire repute, taking first prize, and he is one of the great guns of next year to a certainty. The second prize animal here is well-bred, and has rare hair and handling: his loin and back are, however, improvable, and he is well run up to by the H. C. bull of Mr. Fisher's of Leconfield, that bids fair to grow into a good animal.

Pigeons, poultry, and rabbits were large and excellent shows.

JUDGES. — CATTLE: Mr. Joseph Kaye, Huddersfield; Mr. Jas. Knowles, Wetherby; Mr. Richard Foxton, Wellburn, Kirby Moorside. SHEEP: Mr. John Rob, Thorpfield, Thirsk; Mr. T. B. Whitwell, Gate Helmsley, York. PIGS: Mr. J. M. Turner, Wakefield; Mr. G. Mangles, Givendale, Ripon.

THE ROYAL DUBLIN SOCIETY.—THE FAT CATTLE SHOW.

Some few years ago, when a Christmas fat cattle show was first attempted by the Royal Dublin Society in connection with the agricultural produce show, the entries were but few, and the quality of a very mediocre character, for according to their practice in fattening beeves it was too late to have grass-fed and too early to have stall-fed cattle in that bloom and perfection that good judges require. For a time these shows but barely existed, till some people showed more courage than the rest and began to put in their stall-feds much earlier than usual, took their neighbours by surprise, and bore away the honours; this so nettled the graziers, who grew no roots, nor had the accommodation for stall feeding, that they held meetings and went in for having two classes of fat cattle, one to be stall-fed and the other out-fed on grass, supplemented by artificial food given out of doors. After much opposition by the stall-feeders they carried the point by getting up subscriptions to pay the prizes, the Royal Dublin Society only making itself responsible for the prizes for the stall-fed animals. Thus emulation was excited, year after year the quality and finish of the animals exhibited improved, success has crowned those well-considered measures, and the Royal Dublin Society no longer treats the out-feds like step-children, but brings them under her own wing, and gives them a place and position in the programme at their winter fat cattle show. Such has been and ever will be the effects of well directed emulation, and for the past two or three years beef has been produced at those shows of a substantial quality, though not overloaded with useless blubbery fat.

In two years old oxen there were seven entries, all very creditable. Major Barton, of Straffan House, was put first for a cross between a polled Angus cow and a Shorthorn bull, which was well covered on all its points, with firm elastic meat; he is full brother to the prize two-year-old heifer, the gem of last year's show, and though not so highly finished it may give some idea of his excellence to find he has distanced some of the best feeders in the country. The Rev. Mr. Montray, Farm Royal Anghnactoy, came in second for a capital Shorthorn ox, well covered on the back, loins, ribs, and ends. Mr. Naper, Loughcrew, stood third, and gets a commend for another, both Shorthorns.

Seven excellent beasts made up the exhibition of oxen of any age over two years old, but to the dismay of Irish feeders His Excellency, Earl Spencer, brought over direct from his seat Althorp Park, Northampton, the best finished Shorthorn ox ever seen in "Ould Ireland;" he stood about 5½ feet high, girthed here 109 inches, before leaving home his attendant said he girthed 118 inches, so that he lost in transit 4 inches; his length is 71 inches, and his dead weight estimated at 15½ cwt., he is unquestionably the grandest fore-ended fat bullock we ever saw in Ireland, well padded over crops, back, loins, ribs, and quarters, with firm elastic beef, without a particle of blubber about him, and the best judges declared that nothing like him ever stood in Dublin before; but he was, nevertheless, nowhere at Birmingham. He was purchased from Mr. F. Cuff, who had the sale of him, by Mr. McQuade, a Dublin and Belfast buyer for £65. Major Barton came in

second for another of his cross-bred animals, with good back, ribs, and ends, but not finished over the loin. Mr. Allan Pollok, Lismany, takes the third place, and O'Connell Murphy, Breemount House, Trim, takes an highly commended and a commend for two very well fleshed oxen.

Four cows made up the next section, three of these belonging to O'Connell Murphy, who takes both prizes, and an highly commended. Mr. Allan Pollok exhibited the fourth, which takes nothing, though she handled well.

Three two-year-old heifers made up the next section, in which Major Barton takes first honour with another of his beauties, a Shorthorn cross, but without any Angus blood in her veins. She is about the best and sweetest handler in the yard, square and level throughout, with a grand back, a perfect block of beef, with little offal. Mr. Kingwall, Killynen, takes second place with a close, well-finished half-bred Hereford.

Twelve three-year-old heifers made up the next section, in which almost all the best feeders were represented; O'Connell Murphy takes both leading prizes, the first for a splendid Shorthorn. She was shown fat this time last year, and took second place, and again at the last spring meeting amongst the breeding class, taking first honour. She was however, better beef this time last year, as she is now soft and blubbery in every part, and we have some doubts as to the propriety of permitting a prize fat animal being exhibited twelve months after at the same show, or that she had any claim for the first prize as a breeding animal at the last spring meeting. The second prize is much the best beast, being close and well covered on all points, with prime beef. R. Walsh came in third for a well finished Shorthorn. Thomas Smith, Battertown, Meath, gets an highly commended, and Mr. Gerrard, Gibbstown, Navan, a commend.

In the class of out-fed stock the animals are exhibited in couples. Nine pairs of oxen, of any age or breed, composed the first section, some of which would have been better left at home, being tall and gaunt, with much loose soft skin hanging about them, but in capital condition for stall-feeding. The Earl of Kingston, Rockingham, Boyle, received justly first honour for a splendid pair of Shorthorns; they were in fine condition. Thos. St. George Pepper, Ballygarth Castle, Meath, was put second; Richard Manders, Swords, came in third; and Mr. Thos. Gerrard gets an H. C. and a commend out of five pairs of oxen exhibited by him. Six pairs of cows made up the next section, all of which were good. Matthew J. Corbally, Rathbeal, Swords, was put first, Richard Walsh, Kingswood, second; O'Connell Murphy got a high commend, and W. Stawell Garnett, Williamstown, Kils, received a commend. The next section for the best two outfed heifers of any age contained fifteen pairs, and were as a whole the most catching in the Show, and so good that the judges commended the whole section; but Mr. R. Walsh's three pairs were so evenly matched that they deservedly swept the three money prizes before them; they were the best finished in the class, with splendid backs and ribs, good twists, and regular blocks of solid beef. Saml. Garnett, Arch Hall, Navan, one of the best judges and feeders in Ireland, got a high commend for two half-bred Herefords; and Patrick Mathews, Annagor, Drogheda, had a high commend and a commend for two pair out of three pair shown by him.

The show of sheep was good; but there was still nothing very extraordinary amongst them. In shearling long-woolled wedders there were five pens, Richard Walsh and S. L. Naper taking first and second places respectively, Thos. Mader, Moyvaghly, Moate, an high commend, and O'Connell Murphy a commend. In wedders, between one and three shear, three pens, O'Connell Murphy takes first, and Samuel Garnett second prizes. In long-woolled ewes, four pens, Wm. Owen Blesinton is first; Robt. F. Francks, second; Col. Kane Bembury an H. C., and O'Connell Murphy a commend. In short-woolled shearling wedders, three entries, J. L. Naper first for Shropshire Downs; T. Barnewall, Bloomsbury, Meath, second; and H. C. for the remaining pens. There was but one pen of over one and under three-shear wedders, belonging to Thos. Gerrard, Gibbstown, who gets the prize; and two pens of fat sheep, of any age or breed, belonging to Thos. Gerrard, who takes the first; and Samuel Garnett, who gets an H. C.

The entry of fat pigs was excellent as to breeding and

quality, but few in numbers, fourteen pens, containing 29 pigs, composing the entire class. The prizes were divided between Messrs. Cooper, Limerick; Naper, Loughcrew; Manders, Brackenstown; and Trevor, Beech Hill, Donnybrook.

The poultry was the best collection ever seen in Ireland, as to breeding, condition, and plumage; numbering 318 pens, and embracing every good and distinct variety, of both useful and ornamental birds, and shown in about 37 distinct sections, in all of which there was not a single entry from England. The Society's show of pigeons was also a splendid one, in which were exhibited all the distinct varieties in 58 cages, exclusive of the amateur special prize show, got up by private subscription. The first prize of £5 for the best collection of not less than 12 distinct varieties in pairs, for which there were five competitors; the second of £3 for 9 distinct varieties in pairs, in which there were three competitors; and the third of £2, for 6 distinct varieties in pairs; six competitors; total, 123 cages.

The grain, root, and other agricultural produce was staged and adjudicated on in the week before opening the general show and this on the whole was an excellent exhibition, and a fair exposition of Irish progress; but the wheat this season is not so good as usual; the best white wheat weighed 64lbs. the bushel, best red 64½lbs., barley 59lbs. white oats 42½lbs., black oats 39½lbs., beans 69lbs., peas 65lbs., vetches 64lbs., Irish saved flax seed 53½lbs. There were also samples of mangel and turnip seeds in very fine condition. The show of roots was, as it usually is, a very fine one. The best six long red mangels weighed 154lbs., long yellow ditto 136lbs., red globe mangel 136lbs., yellow globe ditto 136lbs., swedes 79½lbs., and four cabbages 94lbs. Heavier roots have been shown in previous years, but this year is an exceptional one, and the wonder is that they were so good. Some very superior roots, were exhibited by the guardians of the North and South Dublin and Drogheda union workhouses, from the junior pauper farms, which are allowed by the Society to compete with each other at these exhibitions. In addition to the farm produce, the South Dublin Union exhibited some superior pieces of tweeds and friezes manufactured in the house by the junior paupers to be made up into their clothing. A fine collection of roots and other farm produce was shown by the Albert Model Farm, and 23 minor farms under the management of the Board of National Education, very creditable to the Board and those acting under, more particularly so to Mr. Baldwin, the head superintendent. The samples of butter in both cools for present use, and in firkins for export, were numerous and of the very best quality, with only rare exception. Mill and hand scutched flax, and wool in the fleece were very good, but the exhibitors were not so numerous as they might have been.

The Dublin and Wicklow and Drogheda Artificial Manure Companies, and Goulding, exhibited samples of their manures, and specimens of the several materials of which they are compounded; and stands were appropriated to woollen manufacturers of Irish tweeds, fringes, and blankets, the pieces exhibited being of very superior make and finish. Several seedsmen and implement manufacturers and others put in an appearance, so that, upon the whole, it had the character of a miscellaneous fair as well as a cattle show.

JUDGES.

FAT STOCK.—Edward Rigby, London-road, Liverpool; Henry Greene, Dunboyne; Nicholas Ennis, Claremount, Julianstown.

SHEEP AND SWINE.—Alfred Darker, Clonsilla; Charles White, Erkindale, Rathdowney; David Kerr, Cloyne, Edenderry.

POULTRY.—W. G. Merry, Blesinton; Alexander Comyns, jun., College-green.

GREEN CROPS.—Alderman Mackey, Westmoreland-street; James Robertson, Mary-street; James Brady, The Cottage, Raheny.

CEREALS, PULSE, AND SEEDS.—David Drammond, 58, Dawson-street; Geo. J. Alexander, 2, Mary's-abbey.

BUTTER AND HONEY.—B. Murphy, Clare-street; Charles Byrne, 54, Kevin-street; W. J. Goode, Finglas House, Finglas.

FRIEZE.—Joseph Conan, 4, Dawson-street; Alexander Comyns, 10, College Green; James Reside, 20, College-green.

WOOL.—James Ganly, Usher's-quay; J. F. Dixon, 24, James's-street; Robert Millner, Queen-street.

AGRICULTURE IN THE GIRONDE.

This Department, which derives its appellation from the peculiar conformation caused by the junction of the two rivers Dordogne and Garonne, has given the name of the Girondists to one of the political parties which played such an important part at the commencement of the great French Revolution of 1790. It contains six arrondissements—Bordeaux, Bazas, Blaye, Réole, Lesparre, and Libourne, with a total population of 701,855 persons. The extent of land at the last inquiry was 1,860,876 acres, of which 899,390 acres were cultivated lands, 156,652 meadows, 286,516 vineyards, 875,110 woods, and 598,902 of what are called the "Landes." In 1865 there were 290,000 acres in cereals, of which 168,000 were in wheat, producing in all 627,444 quarters, which falls short of the necessities of the population, so that the deficiency has to be made up by importations. The cost of the cultivation is from £3 to as much as £9 per acre. The average size of the small holdings is 8 acres, of the moderate from 25 to 100 acres, and the large proprietary farm about 350 acres, but the latter are quite the exception. Besides the cereals are grown the vine, fruit, more especially prunes, figs, almonds, with vegetables of all kinds, and tobacco.

In Lesparre the hectare (or $2\frac{1}{2}$ acres) of arable land is worth 1,200 to 1,500 francs; in Blaye, for a hectare of alluvial land it is 2,500 to 3,000 frs., and for the best 5,000 to 6,000 frs. The meadows are worth from 3,000 to 6,000 frs., the woods from 1,000 to 1,500 frs. The hectare of vines is never less than 3,500 frs., and in certain localities much higher prices are given. There has been a general advance in the cost of land, which is attributed to the depreciation in the value of money, the improvement in the roads, the cultivation of the wastes, the rise in the prices of wine, and the subdivision of property. In all places the number of animals kept are not sufficient for the manure required; but guano can be obtained easily at Bordeaux, where the importations in 1863 amounted to 313,861 kilogs. more than in 1859, and since that time a like progression has followed. The system of cropping is mostly biennial: the fallow is not everywhere discontinued, but the tendency is in that direction. The forage, roots, vegetables, &c. alternate with wheat: in the marshes the cropping is triennial, wheat being sown two years in succession, and for the third year beans, peas, and sometimes maize.

The cultivation of fruit and vegetables has increased considerably of late years, and, owing to the attention paid to this branch of agriculture, the produce has assumed a very great importance. According to some statistics furnished by the president of the Horticultural Society, it appeared that between the 15th April and 31st August of 1862, 3,000,000 lbs. of "primeur," viz., strawberries, cherries, apricots, prunes, grapes, artichokes, and peas, were expedited by rail from Bordeaux, while 430,800 lbs. of other vegetables and 8,600,000 lbs. of fresh fruit were otherwise exported. In 1863, the total quantity exported exceeded that of 1862 by 7,597,274 lbs. In 1866, 1,800,000 lbs. of green peas, 800,000 lbs. of strawberries, 144,000 lbs. of cherries, and 11,000 lbs. of French beans were sent to Paris. We are indebted to Mr. Sackville West for particulars of the garden produce sent from the Gironde in the year 1865. This consisted of green vegetables, 669,920 lbs.; fresh fruit, 1,536,594 lbs.; preserved, 1,056,666 lbs.; dried, 13,323,258 lbs.; altogether, including herbs, plants, &c., 16,672,056 lbs.

This, however, does not represent the total production, because the consumption of the Department is not included. These crops which, in the rich soil of the Gironde require little expense in cultivation, enhance greatly the value of the land, and are the source of a considerable revenue.

The average prices are: A basket, containing 80 peaches, £4; greengages (Reine Claude), £2 the 200 lbs., and pears about the same price. Green peas, in season, $2\frac{1}{2}$ d. per lb. The prices, however, vary considerably. To give an idea of the commerce in fruit, we have been informed by a resident in Bordeaux that a single confectioner in that city has been known to purchase as many as 4,000 lbs. of Reine Claude every day for a fortnight, besides large quantities of peaches and pears, and he has expended as much as £800 in the purchase of apricots. There is also a species of wild prune which grows about Labresne and Bouillac, and which is very prolific. It ripens in the month of July, and as many as 2,000 baskets may be gathered in a day.

The extent of vineyard has increased from 286,516 acres in 1851 to 320,000 acres in 1869. An acre produces on an average $2\frac{1}{2}$ tons, which gives a total produce of 800,000 tons, valued at £8,753,200. Of this value £6,488,640's worth is exported. The consumption of wine in the Department is calculated at a little more than one-fourth of a ton per head. The wine-growing districts are the Medoc, Graves, Côtes Palus, and Entre-deux-Mers. The Medoc country comprises 40,000 acres, and grows the three "grands crus." The Graves country forms a zone thirty miles in extent. The vineyards are situated on the high grounds in the vicinity of the Garonne and Dordogne, extending from Châtillon-sur-Gironde to Langon. This is the Sauterne country. The wines of the Côtes district are St. Emilion, Pommerei, St. Laurent, St. Hippolyte, St. Christophe and St. George. The Palus and Entre-deux-Mers produce is inferior.

A great change in the mode of cultivation has been introduced of late years, which has apparently been attended with success, both as regards improved production and economy of labour. The vine is planted in such a manner as to admit of the plough instead of digging, and it is pretended by many persons that a greater regularity of depth is thereby obtained—an object of great importance in vineyard cultivation. Iron wire for trailing is coming into use, and is superseding the old stake system. The uncertainty of the crop however, and the expense of cultivation, renders a considerable amount of capital necessary. Some notion may be formed of the fluctuating nature of the wine crop from a statement of M. Clauzel, proprietor of the Château Citran, before the Agricultural Commission: "The property was bought in 1833 for £12,400, and grew 15 tons of wine on 80 acres. Increased cultivation raised the produce in 1840 to 120 tons, and to 264 tons in 1849. The disease now made its appearance, and in 1854 only 26 tons were grown. In 1856, 35 tons, and sulphur was then used, the produce gradually increasing to 300 tons." A small proprietor it is evident would have been—as, indeed, many were—ruined in 1854 by the disease. The growers foresee a formidable competition likely to arise before many years from the produce of California, which, it is asserted, is capable of supplying any quantity of wine of a quality not inferior to the first "crus" of Medoc; and it therefore is of great importance that the vine debilitated by

disease should, if possible, be re-invigorated. The cause of it does not seem as yet to have been ascertained, and no specific remedy can therefore be indicated. Although much diminished it still appears in districts least likely to be infected, and no grower can be sure of immunity from it. The effect of the epidemic has been permanently to raise the price of wine, notwithstanding subsequent abundant years and an increased acreage. From 1888 to 1850 the price of wine grown on the Château Citran estate varied from £10 to £14 per ton. When the disease appeared £32 was obtained, and in 1854 £60; and since then, according to the quality of the vintages, £40, £50, and £80 per ton were realized. It would seem therefore that the disease has benefited the large proprietors.

There are in the Department large tracts of "Landes," as they are called, which have attracted considerable attention at various times, and have been a problem for the engineer and the agriculturist combined. Some fifty years ago great apprehension existed of the destruction of the Medoc country by inundation, as the banks of sand which are the only barriers against the ocean were observed to be yielding. The idea then occurred of planting the pine-tree in order to bind the sand, and the result has been most satisfactory. Besides, it has been found that an acre of the pine-wood produces from 55 to 77 gallons of resinous matter; and although the high prices gained during the American war have not been maintained, the profit per acre is still calculated at from £2 8s. to £2 16s. An acre of good pine-plantation fifty years old is

now worth £30, which is treble what it was thirty years ago. The preparation of resin has become an important industry in the Landes districts, and employs a great number of hands. The liquid matter is obtained by tapping the trees, to the steps of which are fixed small earthen pots, into which it runs. A tree may be tapped when twenty years old, and will support this process for thirty years.

In addition to the culture of tobacco upon about a thousand acres, there are also salt-marshes which extend over 372 acres, producing 30,000 cwt. of marine salt annually. The management of these marshes, and the competition which exists between the salt-farmers of the West and the farmers along the coasts of the Mediterranean, where the climate and certain other circumstances are more favourable, have been the subject of a separate inquiry. Complaints are made of the scarcity of labour and the conscription, which is more injurious to rural life than any other cause, is a severe burden upon the land. The sons of the proprietors, taken from their homes, soon lose, in the majority of cases, all attachment to them and all interest in the soil. This appears to be more the case in France than in other countries, where it is sought in some measure to localize military service, and thus remedy the evil. The great increase also in the sale of wine has led to the development of an industry which is extensive in the Gironde—namely, the cooperage—and agriculture has suffered in consequence, as many labourers have quitted the fields to find employment in the manufacture of the casks.

FIELDS AND FOLDS AT HOME AND ABROAD.

Gouda is an old-fashioned town, famous for the manufacture of cheese, and also for a fine cathedral, specially rich in stained glass windows. This is a fact not very well known amongst tourists, who, if they knew the rich treat in store for them at the town, would not whizz past it so frequently as they do. The cathedral is a very fine and large building; the number of windows filled with stained glass is thirty-one, and many of this large number are very good specimens of the art. From the number of windows thus decorated, one may judge of the large size of the church or cathedral, for they are all large windows and at considerable intervals from each other. Standing at one end of the church and looking down the long vista, with the richly-coloured windows on each side, and up to the high and massive roof, the view is imposing and gives rise to many and varied emotions. The mere size betokens that one of two things must have existed at the period at which the church was built, either that the town was much more important than its size and appearance now indicate, or that the zeal of those who built it for the religion they professed must have been great. This last is most likely, and it is a feeling with which no well-regulated mind can do otherwise than sympathize, even though we should think the zeal misplaced. All honour be to those who in other days evidently thought of something else than the mere accumulation of wealth; who deemed it no small privilege to be allowed to expend it in the furtherance of a cause which they deemed important. We are too apt to ignore the value of what was done in the "brave days of old" and how much we owe to their self-denying exertions. Nor is the least valuable of the many lessons which we learn from travel, from moving in scenes different from those to which we are daily accustomed, from mixing with people of whom generally we have most prejudiced

because ignorant and mistaken views—that we learn to acknowledge the good that has been in other times, and the worth that exists amongst other people. Many a time have we had lessons taught us, and rebukes administered to us, upon points and in connection with prejudices which could only have arisen from ignorance.

One thing cannot fail to strike the observant traveller on the Continent, and this is, that in the grand and impressive structures which are so numerous met with, whether they have been erected for religious or secular purposes, they seem to have been built as if they were thinking for posterity, although we do not believe *this* to have been the ruling motive. They in the lesser buildings and in their own private domiciles built for themselves in such a way that they evidently liked and appreciated the beautiful; and this æsthetic feeling seems to have been so widely spread, that the owners of the meanest—in the sense of the smallest we use the term—house thought it worthy of being beautified, and this apparently with no other motive than of gratifying his own taste, not by any means with the view of thereby adding to the aggregate of the beauty in design and picturesqueness of situation of the town or village in which he lived and moved. Hence it is that an endless variety in design and detail is met with even in the meanest villages of many parts of the Continent; a variety which most thoroughly and strongly impresses the observant traveller with the conviction that he is looking upon dwellings, the inhabitants of which, in times gone by, thought for themselves, were tied down by no conventional rules in the matter of design, just if each had said to himself, "This is my house, and in the way I add to the comfort of its convenience and to the external or internal beauties of design and ornament, shall I set the mint mark of my own individuality upon it; it shall be at once a place for the com-

fort of shelter and delight of beauty." Often as we have wandered with increased and increasing delight through the quiet streets, green with the grass which grows not in the haunts of the busy and the bustling, have we been led to contrast the times in which these "dear, delicious," quaint old houses, rich with many a sculptured door or window, picturesque with many a pointed gable or projecting roof, were reared by loving hands, which in their rich variety told of a race each of which thought for himself, with the times we now live in, in which little, too little of this is seen. Is it that, as we progress in what is called civilization, we go back in giving expression to decision and self-assertion of character, and are content to do slavishly as others do, to follow the multitude in whatever it does? We are bold enough to believe that in the tame uniformity and bald deformity of our domestic architecture, there is something which indicates, if it does not positively influence, the *morale* of modern peoples.

Gouda is a town in which much of what we have now been speaking of can be seen; and, small town as it is, there is that in it which presents a most striking contrast to what we can show in our towns of the same class. A day or two may therefore be pleasantly employed in wandering through its streets, and profitably too, if the wandering feet be accompanied by the observant eye and thinking brain. We would counsel the traveller to take a drive into the country, and if he is, as we presume him to be, interested in agricultural matters, to visit one of the numerous farmhouses which will be met with in the drive of an hour or two.

We took a drive one lovely evening, and as we bowled along the well-kept road, "as level as a die," and saw on either side the meadows with their herds of the "patient kine," which might well have been patient with the rich grasses on which they fed; and, as we passed, quaint old-fashioned houses, one after the other, each with their well-kept garden in front, rich with a glorious profusion of flowers, gorgeous in colour and sweet in perfume—for the Dutch are great lovers of flowers—we enjoyed ourselves exceedingly; nor did we lack the extra pleasure arising from having an object in our drive, for we were purposing to visit a farm-house, the owner of which had a high reputation as a "good Gouda" cheese maker. As we drove along we had a good opportunity of noticing much of the extensive economy, at least of the extensive arrangement of the farm-houses, which were on either side of the road. As a rule they were placed not here and there in the fields at varying distances from the road, but (and this probably arose from the distribution of land and water in alternate strips, to which in our last article we alluded) they were placed close to the road, with this difference, that between the houses and the road a pretty broadish canal on both sides of the road intervened. This necessitated a mode of gaining access to each house, which as you were availing yourself of it made you think of the olden times when each house was defended by a moat, across which you had to pass by the drawbridge let down for you. In this case the drawbridge is replaced by a small floating bridge or platform, which to prevent intrusion was moored at the side opposite to the road, so that we had to shout to the inmates of the house on the opposite bank to make them aware we wished to visit them; and very heartily on our reaching the bank they received us, though utter strangers, whom they had never seen before, whom they were likely never to see again once they had speeded us on our way. The first place we were ushered into was the working chamber or kitchen, as it might be called. A huge barn-like structure it was, very much opposed to what our notions of such a place should be. At first glance it seemed to

possess none, at least few, of the attributes of the order and precision which are the popular characteristics of the Dutch; a fire, or rather the remains of one, lay smouldering in the huge open grateless fire-place—not of coal, but of peat, which is got in abundance in the neighbourhood, as we may judge, from the numerous black pools in the district, with their mossy sides and heaps. At the opposite end the cheese-making part was placed, with its rows of curd tubs and dairy utensils. As already said, the general appearance of the place was anything but Dutch-like, still a more observant glance showed that there was order amidst the apparent disorder, and the national reputation for cleanliness was not belied in the condition of the utensils; nor in the person of the comely, burly, housewife, who gave us such a hearty welcome, and at once began to show us "her treasures new and old." Of these, doubtless, the cows would have formed the not least valuable portion had they been at home; but the "cattle had not been called home," they were browsing to their hearts' content in the rich pastures beyond the canal, and were therefore only to be talked of, not seen; but with as much pride and glee as the boy who once had a sixpence but had spent it showed off the purse which had contained the treasure, she showed us the stalls they would have occupied had they been at home; and from the way she talked of them, and the pride she took in showing the milk and talked of the cheese which the milk produced, she let us know that in her opinion they were "sehr schön," very good cows not a doubt of it. As to the cow-house, there was nothing very particular about it, not even its order and cleanliness, although it was by no means dirty, yet it did not come up to anything like the condition in which we have seen so often exemplified in cow-houses nearer our home. In many of the cow-houses of the Netherlands the cows are fed not in the stalls but from a feeding passage at the head of the stalls. This is not open overhead as with us, but is in reality a distinct apartment; although, of course, narrow and passage-like, still of good free width. The way in which the cow gets at the food seems odd to us; a long aperture broad at the top and narrow at the bottom and curved at these points, is made in the partition which divides the stalls from the feeding passage, and through which aperture "crummie" quietly shoves her head when the food is placed in the "licking-tub" in the feeding passage, and at other times too, for we often saw her looking through the aperture when no food was there for her, with that look of apparent wisdom which one often sees in cattle, and as if the prospect was, if not enlivening, provocative of intense thought, doubtless, if we could read it, of the mess of food which would be there at its proper period. This arrangement of feeding passage is done, no doubt, with a view to the obtaining of the quiet which we all know is so important. With the same view the cow-houses are generally dark, at least not well lighted. The cow-houses are generally quite close to the house, so close indeed that in some farm-houses direct access is had from the kitchen to the cow-house, an arrangement one would think more convenient than comfortable; in such cases the cow, like the Irishman's pig, is esteemed as one of the family, and treated accordingly. The animals are all house-fed in winter-time, and the leading food is hay. The hay-house forms, therefore, an important part of a Dutch farm-house, for it is well kept under cover. So far as our observation showed, we do not think the practice of cutting the hay is extended, although hay-cutters we have seen, and evidences also that mashes or boiled food were part of the dairy economy, to one important part of which we now come. The "guidwife," a bouncing, blooming woman, in the fair way of acquiring the true "Dutch build and

breadth of beam," obligingly showed us the process of making a "Gouda cheese," so far at least as the working up of the curd into the peculiar form so well known, and its after management. She did not show the same readiness to detail the preliminary processes, but we believe the following method is pretty nearly that followed by the best makers, at least it is said to give a product as good; it is for those of our readers who are skilled in dairy work to say whether it is worthy of adoption amongst us. The rennet is prepared very carefully, being steeped in water along with salt and saltpetre and about a quart of wine vinegar, the whole being allowed to stand for about three weeks. About a gallon of water is used, about ten pounds of salt, two ounces of saltpetre, and six "bag pieces," or stomach of the calf. The milk used at one time is that produced at one milking, and is put into a wooden vessel, which we need not say is kept in Holland most scrupulously clean, as all dairy utensils should be kept if success is desiderated. In the farm now under notice there were several vessels, and all of moderate size. On the rennet being added to the milk, which when required is slightly warmed, the whole is gently stirred. When the curd is formed the whey is poured off, this being expedited by breaking or pressing the curd with the hand. So far as we saw the curd was not cut up or broken with a "curd breaker." A small vessel is next taken of the same internal diameter and depth as the finished cheese presents; into this a portion of the curd is placed, being taken from the curd vessel in a small dish. The small vessel or mould is provided with a perforated sieve-like bottom, and the whey passes through the perforations as the curd is carefully pressed down into the mould. As the curd gets dry other portions of curd are placed in the mould. But the process is not one of pressing merely—a careful and thorough kneading of the mass is gone through; this being done by the hand, and we presume has for its object the giving of that close compact solidity to the cheese which is one of the characteristics of "Gouda," for, as is well known to those who eat it, it is not an open friable cheese like some English-made cheeses. When the mould is filled sufficiently with a well-kneaded mass, it is taken out and worked most deftly into proper shape by the hand, in which process the flat

edge gradually assumes the rounded form so well known. During the shaping the compressing process is carefully attended to, and the surface repeatedly washed with the whey which has escaped from the curd, and which has been collected in the vessel, upon the top of which the mould stands when being filled and pressed, the whey being merely lifted up by the hand from the vessel, or the cheese dipped into it. The accuracy of the form given to the edges of the cheese is only gained by long practice. The formation of the cheese from the time the mould is first filled till that when the cheese is finished is about a quarter-of-an-hour or twenty minutes. The great point aimed at in the manufacture of the cheese at this stage is evidently to get the whole mass into a collection of perfect uniformity and as compact and close in texture as possible. The pressure to which the cheese is subjected is at first slight and is gradually increased; but the pressure is not nearly so long continued as in other cheeses, which may be well conceived from the nature of the process already described through which the cheese is put previous to being pressed. After being taken out of the press the cheese is steeped for about a week in a strong salt pickle, so strong as to float an egg, and is, while in the pickle, kept covered on its upper surface with a layer of salt. The cheese is then placed in a cool chamber upon a shelf, and turned from time to time till it is fit to be sent to market. It was with no small degree of pride that the housewife showed us her store, with none the less but rather the more satisfaction, however, that her store was little, she having sold nearly all her stock. It was hard indeed to say whether she had more pride in her cheeses than in her little "kammer," a sitting room, the ornaments of which she showed with a natural simplicity, and almost childish glee; which pleased us mightily, as all natural behaviour always does. She was disposed, like all good-natured people are, to be very communicative; and, if she had known English or we Dutch better than either of us did, we have no doubt that a full, true, and particular account of her and her belongings would have been given us. Fortunately she knew, and we understood enough of German to enable us to get much pleasant information as to farm-living and farm-ways amidst the green pasture-fields of Gouda.

STOWMARKET FARMERS' CLUB.

THE BREEDING AND MANAGEMENT OF PIGS.

At a monthly meeting of this Club Mr. STEARN read a paper on the breeding and management of pigs. He dwelt on the importance of the pig, an importance now recognized by Agricultural Societies, and spoke of the astonishing fecundity of the sow, and the value of the flesh of the animals as an article of food. He said formerly large breeders and graziers thought the pig beneath their notice; but the thing was changing, for he supplied gentlemen in Australia, America, and almost all parts of the world. Still he was often both disgusted and surprised to see what a disgraceful lot of pigs was still kept by many large agriculturists as well as small ones, such, as if kept to any extent, would ruin any one, for they ate an enormous quantity of food, and would neither grow nor fatten upon it. He had studied the management of pigs for the last thirty years, and had found that the better the attention paid to them the greater the profit, and if a person wished to make a pig pay, it must be kept well when young, and not allowed to run twelve months in almost a starving condition. He must first speak of the piggeries, and he must say he seldom saw one he considered fit to put a pig into. Some were badly ventilated, others low and damp, nine-tenths

too small, some too confined, with no means of altering them between summer and winter, and many had the cisterns to receive the wash, &c., from the house inside them, which was very bad, the constant stench injuring the health of the animals, and was most unpleasant to those who had to attend to them. But the worst sties were those with wooden floors laid over a pit, which became full of unwholesome rubbish. He had said he was surprised at the pigs kept by many persons; but he did not know if he ought to wonder so very much, when he took into consideration the general construction of places in which they were kept. If there were one corner on the premises worse than another, there the pigstye was placed, and people almost wanted marsh boots to get to it. There was no question that it would be a great boon to the tenant-farmers if landlords would take more interest in providing better buildings for the pigs. It was not the most expensive place that was the best, but what was required was a simple, economical, well-situated, and well-planned piggery. Some built expensive brick and stone buildings, which he had proved were not so healthy as a boarded building, tiled and slated; it should be reeded and plastered underneath to pre-

vent the heat of the sun penetrating in summer and the cold in winter, with a ventilation at the top made to open and shut. There should be half-doors. The farrowing pen ought to be large, to give the sow plenty of room, and to admit of rails being placed round the side, so fixed as to prevent the sow lying on the little ones. These rails should be made to shift according to the size of the sow, from eight to twelve inches high, and extending about nine inches from the wall, having the supports carried out sloping from the rail to the wall, instead of straight from the floor, so as to leave plenty of space for the pigs to pass between the sow and the wall. Since he had used these farrowing rails he had had hundreds of pigs, and had lost scarcely any from being crushed, whilst taking an average of the country nearly half were lost from that cause. Each pen should be 8 ft. by 10 ft., and the best floor was asphalt or concrete. Boards could not be healthy, for if placed close the moisture stands, and the floor becomes sootweated, and if a space be left the refuse litter goes between, so that it will become a mass of putrid matter, likely to bring on all kinds of diseases. In cold weather asphalt or concrete was too cold for very young pigs, and he had false lattice floors to lay down. These were taken up when required, and everything swept from underneath. He had the beds attended to, and fresh littered every morning, for the cleaner a place was kept the better the pigs thrived. The floors were washed down occasionally, and everything ran off, the asphalt or concrete soon drying. Another advantage of such floors was that they did not take more than two-thirds of the straw required for any other floor, for the moisture seemed to run under the litter without wetting it so much, the floor being laid a little on the slope. The litter from the pens served for the pounds outside, which ought to be paved in some way to prevent the pigs rooting. A tank should be made just outside to receive the drainage from the pounds, the building being troughed to take off the rain water. The manure was thus made regular and good. On the hot-days such a piggery was cool and pleasant by opening the lower doors. Lattice slips were put to all the lower doors to prevent the pigs getting out. Whilst pigs were perfectly cool in this model piggery, the herdsman had to go round several times in the day to all the other places with a watering pot to pour water over the pigs to keep them alive. He then spoke of breeding, saying that in selecting pigs for breeding, great attention should be given to choosing a good breed that would come to early maturity, for that was where the profit was gained, and the better the quality of the breed the less food was required to bring them to that maturity. He considered no other breed so well adapted for most localities as the black and white Suffolks. The improvement took place not before it was wanted, for a worse animal could not be found than the old Suffolk pig, with its long thin snout, large lap ears, arched back, long legs, thin body, coarse, bristly hair, thick, long, straight tail—in fact, with everything to make it a disgusting-looking brute. When he read a paper on "Swine," a few years since he said he did not like black pigs so well as white, but by judicious crossing they have become equal to the white, and he now had scarcely a preference. They were similar in form and symmetry, and both come to early maturity, and fattened to a great weight with a small quantity of food in proportion to that weight. In choosing the boar and sow of the Suffolk breed, the chief points were a rather small head, with wide, heavy chaps, short snout, broad deep chest, ears rather small and thin, with the ends sharp and pendulous, pointing a little forward, roundness of rib, shortness of leg, and small feet, long body, the thigh well dropped close to the back, shoulders and hams thick, the neck rising well behind the ears, small bones in proportion to the flesh, broad or straight, or slightly rising back, tail small and curved and placed high, hair thin, long, fine, and silky. As much or more attention ought to be given to the boar as the sow. He preferred sows for breeding to be rather larger than the boar and good sized animals, they being more likely to have a large number of pigs. He considered ten or twelve pigs sufficient in the general way to bring up. A sow for breeding should have ten or twelve pups. He did not recommend breeding very young. The proper time for the sow to begin was from ten to twelve months old, the boar being from eight to twelve months. It was well to cross as far distant as possible, occasionally so as to strengthen the constitution. Some time back

he purchased sows from two gentlemen, one of whom had bred in, for more than 30 years, and the other for 60. The first farrows they produced with him came out full of ulcers, the legs of most were crooked, with large spavins, and many turned out good for nothing. When wishing to make a cross, his plan was to buy a sow of a different blood, and then to fall back on his original stock, retaining, by this means, the same character without injuring the breed. The time of gestation averaged about 113 days, but old sows were rather longer than young ones. A sow in pig should have full liberty to roam about, and feed on grass in the summer, whilst in winter she should have roots of various kinds, and about three-quarters of a pint of beans per day. At the time of farrowing, the proper plan was to have a man with the sow to attend to her, as it was not wise to lose half, or perhaps the whole of the pigs for want of a little attention at the most critical time. He also gave only a very small quantity of litter cut short, and he had a hamper placed in the pen with a little straw in the bottom, and lined with an old blanket. A partition about 2½ feet high was put across the pen to prevent the sow getting at the hamper as the pigs came out. The pigs were placed in the hamper and kept there till the sow had done farrowing. After that they were put to the sow to suck, and then put back to the hamper. The sow had then a little warm milk and bran given her, and the bed was attended to whilst she ate this, and the pigs were allowed to go to her again after she had finished her meal. He found that it was the cheapest and best plan to give the herdsmen 6d. each for all pigs he could bring up to a month old. As to a sow eating her young, the cause was that in some litters the side teeth were much longer and sharper than in others, so that when the pigs began to suck they bit, and scratched the paps, and caused irritation, which sent the sow mad with rage; she threw one one way, and one another, and if she drew blood would eat the pigs, and a sow that once did this was no further use for breeding. His plan to prevent this was to take away the pigs in the hamper, so that the sow could not hear them, and nip off the long teeth with a pair of pincers. When they were put back the sow would be found to be kind to them, and perfectly docile. With his model piggery, he preferred breeding in the winter, as the building could be easily kept to the proper heat, and after proper care for the first day or night, the cold did not appear to affect them so much as heat. Pigs, which were farrowed in January or February, would grow and thrive in the spring and summer, after being kept eight or nine weeks with the sow before being weaned. They were then fit for either breeding, feeding, bullock yards, or anything for which they might be required in the autumn. By this means they could have another litter of pigs in August, instead of October, for when farrowed too late in autumn young pigs would not thrive through the severe weather in winter, and if they were turned as usual into cold yards or open piggeries, they would be worth very little more for their two or three months' keep. Eight weeks in summer and nine in winter will be found a good time for weaning pigs, and he liked to have those which were, not saved for breeding operated upon a short time previously. Boars, for stock, he kept confined in a shed with a roomy yard, allowed them plenty of water and fed them on any food which was most convenient such as vetches or mangold wurtzel. As to feeding, when the pigs were about three days old, and whilst the sow was feeding, he gave them some new milk, warm from the cow, sweetened with a little sugar. In three or four days he mixed half-skimmed milk and some oatmeal or sharps, leaving out the new milk by degrees, as well as the sugar, replacing them by Indian corn or barley, whole. The sow should be fed on mild food for a few days, such as bran mixed with warm milk. After a few days add barley or bean meal, and increase the quantity of these as the pigs grew. For a few weeks after the pigs are taken off the sow they cannot be fed too well or too frequently, but care should be taken not to give them too much food at a time. He gave them a variety of meals, as were most convenient, wetted them with cold and scalded with boiling water, and sprinkled it with a little salt. The food was mixed a day in advance which gave time for slight fermentation. In summer the food was mixed entirely with cold water, and given cold. Between meals he gave the pigs whole maize, mangold, and swedes, cut small, with a little coal or soil occasionally, and he allowed them plenty of clean water. For fattening he gave wheat, barley, and maize meal mixed together into slops, water always kept

by them, and a little mangold cut for them occasionally. Washing and brushing was very beneficial. The difference between this and the common method of treatment was most surprising. Store pigs should have their liberty as far as convenient, and have the range of large yards in winter and of a piece of pasture in summer. Well-bred pigs, properly fed, would always consume the refuse of the farm and dairy. As to the tails of young pigs falling off, the cause was a mystery he had not been able to solve. He gave in detail his experiments, made with a view to test the generally-received theories, and said, "I have quite made up my mind it is neither breeding, feeding, hot weather, cold weather, nor easterly wind which is the cause, nor does it signify whether the pigs are black or white; therefore I must leave it to some one with a wiser head than I have to solve this mysterious affair."

Mr. COCKSEGE asked Mr. Stearn if he had seen a pen of pigs at the Islington Show, sent by the Rev. Mr. Baily, of Swindon, a great breeder of Berkshire pigs. There were three of them, and very fine specimens. They had been sent to the Birmingham Show, where they took the first prize, but at Islington the judges would not even allow them to be placed. The matter was very much discussed during the show, and perhaps Mr. Stearn could enlighten them as to the cause of this decision at Islington.

Mr. STEARN said he knew all about it, but did not know that he could state all that he did know.

Mr. COCKSEGE said the pigs went to London in nobody's name, but with a number.

Mr. STEARN said he was astonished. He was, in fact, asked to go and look at the pigs. He found them to be a pen of beautiful pigs, and they had been put on one side as of "Not sufficient merit." They were not fat enough, and that was the cause of their being rejected.

Mr. COCKSEGE: They were only three months old.

Mr. STEARN: I beg your pardon, they were nine months old, but the Berkshire breed cannot be fatted so early. They were, however, a pen of beautiful pigs, and it was a good bit too bad to put them on one side.

Mr. COCKSEGE: May I ask you if the tail of a pig is of any great importance to the pig? Why I ask is that I want to be practical. I have been in Wales, and there the shepherds never bite off the sheep's tails, but let them grow, because they say they serve to keep the sheep's bellies warm. I don't know whether that little fine tail of the pig serves to keep the pig's belly warm.

Mr. STEARN: It is about as useful, perhaps, as one of your ears. You might cut one of them off.

Mr. COCKSEGE: I should hear as well.

Mr. STEARN: That might be, but you would not look so well. You would prefer a pretty girl to a bad-looking one, would you not?

Mr. S. SCOTT asked Mr. Stearn what proportion of sugar he used for the young pigs.

Mr. STEARN: I can scarcely say, but I make it pretty sweet.

Mr. S. SCOTT: How much sugar to the pail of milk, I mean.

Mr. STEARN: I don't mix so much as that at a time. To a pint of milk I put a tea or perhaps a desert spoonful of sugar.

Mr. SCOTT asked Mr. Stearn what was his opinion of the use of acorns as pig food.

Mr. STEARN said he did not like them at all. He had tried them, but nevertheless did not like them. He believed he had suffered this summer from the use of acorns. He had lost several very valuable pigs, only from eating acorns.

Dr. SHORT: May I ask why you thought you lost them from that cause?

Mr. STEARN: Because those that ate acorns died, and those that did not eat them, did not die.

Dr. SHORT: But what was the cause of death? Did they produce constipation?

Mr. STEARN: Yes, the bowels were too much confined.

Mr. LINGWOOD asked Mr. Stearn if he had ever noticed a difference being indicated in the young female pigs, between those that were good and those that were but indifferent breeders, in the placing of the paps? It was a matter of experience with him that where the paps stood in two rows evenly, the sow would be the better for breeding than where they were uneven or irregular.

Mr. STEARN said he thought the straighter the paps stood

the better for breeding. If they were scattered or a little out of the straight, such a pig was seldom very good for breeding.

Mr. LINGWOOD said he was inclined to think that the better the pigs were bred the fewer they would find that were so formed.

Mr. STEARN said he could not say he had ever noticed that. In fact he had never had any very bad ones to deal with.

Mr. PAGE: You had your stock from me.

Mr. STEARN: Mr. Page says I had my stock from him. I do not know, I am sure, but I have as few bad ones as possible. Mr. Stearn added, in reply to Mr. Lingwood's further questions, that he generally put such pigs on one side.

Mr. LINGWOOD said he believed attention was not always paid to the indication he spoke of. The largest and strongest animals were set aside for breeding with very little regard to the point he spoke of.

Mr. WOODWARD (the Secretary) said he invariably found that the largest pig would make the most productive mother. Still he always saved for breeding those sows whose paps were formed in the most regular way. He did not think, however, that there was much dependence to be placed on the rule for saving pigs. He had found the smallest to make the best breeders and the best mothers.

Mr. H. A. OAKES asked if the size of the animal was not of great importance. In breeding, he believed it was generally held that breeding animals could hardly be too long.

Mr. WOODWARD said that he considered size and length of great importance in breeding sows. He gave the preference, too, to long animals before short ones. Was that Mr. Stearn's practice?

Mr. STEARN: Yes.

Mr. WOODWARD: How about the condition of your breeding sows? I don't care about keeping them too high at the time of farrowing.

Mr. STEARN: No; keep them as low as you can. Bran slops a few days previous to farrowing, and after you take the pigs to her give better food.

Mr. WOODWARD said he quite agreed with Mr. Stearn as to the importance of the subject. He did not think that any more profitable stock could be bred than pigs. They must, however, in starting, see to the breed. He quite agreed with Mr. Stearn that no profit could attach to the old Suffolk pigs.

Mr. STEARN said that a neighbour of his had tried a lot of them, and found, amongst other evils, that they were so wild as almost to destroy the place they were kept in. He then put into the place some that he considered well-bred, and they were quiet enough.

Mr. H. A. OAKES asked Mr. Stearn the cost of his piggery as shown in the model.

Mr. STEARN said that with poplar boards it would cost about £25.

Mr. OAKES: Then you don't advocate the use of the brick and mortar? Wood is more generally the tenant's work. If the landlord builds, he expects it to last for 30 or 40 years.

Mr. STEARN: This will last 30 years ("No, no.") My poplar board building is now ten years old, and I believe it will last that time. It is as good now as when first built.

Mr. OAKES: I believe if all landlords would supply good buildings it would save the tenants great expense. Good lodgings save food, for warmth is equal to food. The better the buildings the easier it is to fat the stock.

Mr. STEARN said, that he employed his own men to put the piggery up, instead of tradesmen. It was only asphalted inside. If they went to the timber yard and bought the boards, he did not think it would cost above £30.

Mr. OAKES suggested to Mr. Page that it might be cheapest for him to go to his landlord and get him to build the place and pay five per cent. for the outlay.

Mr. PAGE said that might cost him too much, as he might live too long and pay too much that way.

Mr. WOODWARD said he thought there would be no difficulty in getting such a building for the money Mr. Stearn spoke of. It was 24 feet long, and they usually calculated that open sheds 18 feet wide, brick and tile, would cost £1 a foot running measure.

Mr. STEARN explained that the aspect of his building was south, and he pointed out that the doors were so arranged that a thorough draught could always be secured. As to

feeding the pigs when very young, the sweetened milk was put into shallow troughs. Of course the young pigs were frightened at first and cut off, but they would soon return and begin to nibble at the edge of the trough, and from that they soon began the milk.

Mr. WOODWARD : Then, you don't begin by giving them maize ?

Mr. STEARN : No, not till they are four days old. Then we begin to give it soaked, as, of course, they cannot eat it without soaking.

Mr. WOODWARD : Will young pigs begin to eat maize at four days old ?

Mr. S. SCOTT : I was about to ask the same question.

Mr. STEARN : Yes.

Mr. HATTEN asked how much salt was given with the meal.

Mr. STEARN said he could not say. He merely threw a handful in the cistern now and then, as the meal was mixed. The pigs seemed to like the food the better for it.

Mr. LINGWOOD said he knew of a case where too much salt had been given, and the pigs died. Salt for pigs was all very well after they were dead.

Mr. S. SCOTT asked if Mr. Stearn really thought that there was any profit in the rearing pigs for cups. Of course it was very nice, but was there any real profit about it ?

Mr. STEARN : I must say I think there is more profit in the breeding and rearing pigs than there is in any other animals. As Mr. Page knew, he had tried almost everything, and he

found that nothing paid like pigs. He had a lot of bullocks once, which paid him 10s. 6d. a week, at a cost of 13s.

Mr. PAGE said no doubt the pig was the most profitable animal they could put on the farm, but unfortunately they had not the attention they ought to have. They had not from himself he knew, and he thought he might answer for almost everyone in the room except Mr. Stearn.

Mr. STEARN said it was very important to have a good herdsman.

The CHAIRMAN : Generally the pigs are left too much to boys.

Mr. STEARN ; Generally the master does not look at them once a month.

Mr. PAGE said he did not ; but confessed that he liked sheep better, because there was some wool. He must say, however, that he had never seen a pig eat whole maize at four days old. Sometimes he had given them a few oats, but they could hardly manage them. He should like to see them crack Indian corn, for he was quite an advocate for feeding young pigs, but never could get them to eat under ten days.

Mr. KISTRUCK : Perhaps you have never knocked the teeth out.

Mr. FRASER said it was, doubtless, of the greatest importance that pigs should be kept clean. Mr. Page appeared to question some of Mr. Stearn's propositions, but he could hardly do so, when he said he did not see his pigs once a month.

A vote of thanks was passed to Mr. Stearn.

THE WENLOCK FARMERS' CLUB.

At the last meeting, a discussion took place on "The evil arising from the present system of importing foreign stock."

Mr. H. W. KEARY said he was not one of those who ascribed all the evils of the present day to the free introduction of stock. Pleuro-pneumonia and the foot-and-mouth disease—diseases from which they suffered more than any other—he did not think originally came from abroad, or, at any rate, he did not think they were now propagated by the introduction of foreign stock. Properly speaking, they were epizootic diseases. He thought they arose from atmospheric causes, for they frequently found them breaking out in districts where no foreign stock had been introduced. He had known something about farming for forty years, and his impression was that pleuro existed in this country long before the free introduction of foreign cattle. His impression was that both pleuro and foot-and-mouth disease were rife in this country before foreign cattle were imported. But some diseases came directly from abroad. There could be no doubt whatever that diseased cattle were introduced, and it was equally certain that the present system of importation was objectionable. If any plan could be devised for compelling the animals imported to undergo a quarantine, or for slaughtering them at the ports of disembarkation, it would, he thought, be very desirable. There were difficulties in the way of the latter remedy which he thought would render it at least difficult to carry out, and he was therefore of opinion that a complete system of quarantine would be most desirable, especially if certain ports were defined for disembarkation, and animals were not disembarked promiscuously at any port in the kingdom. He thought also that very many of the evils farmers at present laboured under might be avoided if a different and a better system were adopted when those diseases existed in a district. As to the foot-and-mouth disease, he thought it was propagated sometimes in the most unjustifiable manner by the carelessness of those upon whose farms the diseases already existed. There were gentlemen at that table who could bear him out when he said that the disease had been carried about in the neighbourhood of Bridgnorth—between Wenlock and Bridgnorth—by the practice of allowing pigs to run about, from farms where the disease existed. They knew that the habit of the pig was to get into every hole, into every filth, and he did not know any animal that would be more likely to spread disease. He thought that when disease existed on a farm, no animal ought to leave it. Although

he admitted that the restrictions which had been enforced upon the farmer were exceedingly inconvenient, and had been attended by heavy loss, yet he believed those restrictions were attended by very good results in preventing the spread of their local diseases, and he thought the manner in which diseases were spread about the country had now become so apparent that more stringent rules than existed at present should be enforced as to the movement of cattle. He thought some simple machinery might be devised for carrying this out. As to the foot-and-mouth disease, although it was a troublesome disease, it was rarely fatal, nevertheless the milk of a diseased animal was most dangerous for a human being to drink. He did not think pleuro could be communicated so easily. He was not sure that it could be communicated except by contact with an animal already diseased. He thought it a subject well worthy of their consideration as to whether some more stringent rules could not be enforced to prevent infection spreading when disease existed in a district.

Mr. EVAN DAVIES, sen., would like to correct one part of Mr. Keary's speech. That gentleman had said that foot-and-mouth disease and pleuro were in England before the introduction of foreign cattle. What he meant, no doubt, was the free introduction of foreign cattle. Pleuro, he (Mr. Davies) believed, was introduced into this country by Dutch cattle in 1840. He was fully aware that that was a very delicate question that they were going to discuss. He recollected the enthusiasm with which the struggle for free-trade was carried on, a quarter of a century ago, and he believed that the man who now attempted to introduce the old question of protection would be met with ridicule. Acknowledging this, but believing at the same time that the result of free-trade had been to enrich others more than ourselves, yet he did say that the farmers of England should at least have fair play. All they asked for was just and equitable laws. Give them those, and they would defy the whole world. They did not intend to appeal to the country to put an end to the introduction of foreign stock. No ; but they did wish to impress upon the legislature the necessity of taking efficient means for preventing the importation of diseases, and the dissemination of them over the country by which their flocks and herds were destroyed. For himself he had no doubt whatever that that was a question as much affecting the interest of the consumer as the producer. His belief was that the supply of animal food in this country had been lessened rather than increased by the introduction of foreign cattle. He would read

the substance of a report drawn up by Mr. Kilby. From this it appeared that during the last thirty years cattle had been destroyed by lung disease of the money value of £53,597,198, by foot-and-mouth disease £43,389,219, and by rinderpest £4,647,378; making a total of £100,633,795. It was entirely from foreign diseases that that great loss had been sustained. Then, again, the Government statistical returns for 1868 put the cattle stock in Great Britain down in money value at £78,809,203, so that the loss sustained by foreign diseases exceeded the value of all the cattle stock in Great Britain at any one time by £21,824,592, or, as Mr. Kilby had put it, 127 per cent. on the stock held by the British farmer. This was a great loss. Had the country been compensated for it? He feared not. He believed, and his belief was borne out by facts, that the British consumer was seven per cent. worse off than if he had never tasted foreign beef at all. The present price of beef was strongly confirmative of this. Taking the five years preceding the free introduction of foreign stock, the price of beef was 5½d. per lb. Now it is 7½d., so that the effect of the introduction of foreign stock has been to mulct the consumer in 2d. per lb. Some might say that the rise in price was caused by an increased consumption, but he did not think that accounted for it. He knew, when the consumer was smarting under high prices, it was a common thing for him to say it was the farmers' fault, but he denied that *in toto*. He maintained that the farmers of England had struggled hard, and had struggled successfully, so far as was possible, to keep pace with the population. And so long as the consumer was content to be fed by the British farmer, he was well fed and fed cheaply. He enjoyed his beef at 5½d. per lb., but when he began to grumble and went elsewhere for a supply, he had raised the price of his beef by 2d. per lb. He thought, under all those circumstances, that the consumer ought to join the producer to press upon the legislature the necessity of taking such steps as were necessary for the whole of the cattle to be killed at the ports of disembarkation, or at any rate to adopt some stringent measures to prevent the spread of diseases that did such damage to the farmer and also the consumer.

Mr. H. BURTON read the following statement of the regulations observed upon the importation of foreign cattle: "The Privy Council watch over the importation of foreign cattle with extreme care and attention, and I may say anxiety, and are very exacting in having their directions complied with; no time or trouble is spared in meeting every emergency as it occurs, such as notice of disease in any particular quarter; very little (if any) discretion is allowed the Board of Customs. Instructions are received from time to time from the Privy Council as to what prohibitions are to be enforced, which makes it somewhat difficult to give you more than a general idea of the practice or system which Mr. Keary styles an *evil*, as it differs under so many different circumstances; but everything is defined, and nothing allowed, as a matter of course. I must speak more particularly of the Metropolitan area; the outports are governed by special rules, according to local conveniences. The importation of cattle is looked upon as merely permissive, being necessary for food, and not for feeding or breeding purposes. Upon this principle is established a groundwork, whether at outports or London. All cattle arriving from a non-infected country are examined on landing, kept in quarantine for twelve hours, and then examined again. If landed at Thames Haven, they are sent up to the Metropolitan Market by railway, to be slaughtered; and the same process is allowed only at other specially-defined landing-places. There is a landing-place at Plaistow, where the cattle are slaughtered on the spot, which operation must be performed in all cases, although a clean bill of health is proved, within ten days. No single head of cattle (or more) once entering the Metropolitan area is allowed to go out of it alive. Should a cargo of cattle arrive from an infected country all must be slaughtered on landing; a certain time elapses and disinfection takes place before the premises are again used. Should a cargo arrive from a non-infected country, and one head thereof is diseased, all are slaughtered on the spot. This applies equally to oxen, sheep, swine, goats, &c. No regulations could be carried out more stringently, the idea being that the importation of cattle is necessary to provide food for the country, and in this case it does not matter whether the supplies reach the market dead or alive. The following illustration of the strict measures

adopted is worth recording. The Queen recently had a bull sent her from the Duke of Saxe Coburg. It was for breeding purposes, and of course was only of use alive. The correspondence about the beast was most voluminous. It was at last allowed to be sent to Southampton, this being the nearest point by sea where it was required. It remained in quarantine twenty-eight days, and Her Majesty had further to give bond for £100, as a guarantee that the stipulations of the Privy Council were complied with. It is impossible for me to guess at the *evil* (perhaps it is because it keeps down the prices) pointed out in the notice which calls the Farmers' Club together to discuss. The simple truth seems to me that the people of England will have "roast beef," and the country cannot produce a quantity equal to the demand. It is, therefore, actually necessary to import stock. The question remains, how to do it without spreading disease—a contingency which is always to be provided for. As a practical effect of your deliberations, if the resolutions passed are forwarded to the Privy Council Office, I am sure if there is a precaution discovered, or an original idea expressed, a very courteous and considerate reception will be given to the same. In advancing the information which I now supply you with, although I know it can be relied on, so far as regards the practice here, I cannot imagine that a man like Mr. Keary would propose to lead the discussion without he was prepared to prove that an evil existed, or that he had found out a grievance, and with his interest and general knowledge I must give him credit for knowing something. Allowing that there may be "a something" which has not come under my notice, still the authorities would never adopt the extreme care they do in London, and allow it to be entirely nullified by laxity at the outports, so you may depend upon the same general preventive measures being in force throughout the United Kingdom, and if so what more can be done?—when it is impossible to stop the importation of what is called "foreign stock," but is in reality the nearest imaginable approach to *dead meat*! All cattle are examined by veterinary surgeons, and marked with a brand, which is known to the police, who have power to act when the control of the Customs ceases. The following statistics may interest the Farmers' Club. The two first returns have been published; perhaps they may not have been seen by those they are intended for. The last return is arrived at by taking in detail rather extensive accounts. I have, therefore, only given you the number of oxen, which I think will be of most consequence—to include sheep, lambs, and swine would entail a vast amount of time and labour. The remarks I have made, referring as they do to London—to which port a great many more cattle are sent than the rest of the United Kingdom put together—must, I think, carry considerable weight:

Imported into the United Kingdom during				
Aug., Sept., and Oct.			October (alone).	
Oxen	65,187	25,265	
Calves	9,409	2,909	
Sheep	168,623	60,433	
Lambs	3,020	1,728	
Swine	32,853	10,955	
Oxen (including cows and calves) imported into the following ports during August, September, and October:				
Falmouth	1,526
Grimsby	nil
Hartlepool	1,055
Harwich	nil
Hull	6,001
Newcastle	1,762
Plymouth	2,007
Portsmouth	2,120
Southampton	3,704
Liverpool	5,251
London	44,859
				68,285

Return No. 1 for the United Kingdom 74,596
The above ports 68,285

For ports not stated above ... 6,311
Return No. 1 for the United Kingdom ... 74,596
London 44,859
United Kingdom, except London 29,737

Mr. M. G. BENSON, the chairman, said that some of his cattle had taken the foot-and-mouth disease from some cattle on adjoining land, which was in the occupation of a jobber. The man affirmed that there was no diseased stock when they arrived, and that he gave precautions to his (Mr. Benson's) cowman to keep his stock away, as the stock introduced had come from an infected place. There was no doubt whatever that his (Mr. Benson's) animals caught it in that way, but the singular part of the affair was that Mr. Lever's cattle, on land adjoining, intermixed with the others, and yet that gentleman had not one attacked. His (Mr. Benson's) cattle must have caught it over a gate, but the others, although intermixed, did not take it at all. He thought it rather remarkable that, during the cattle plague, South Shropshire should have been so free from it, as compared with the North. The most infected parts were those on the other side of the river, and he thought the river, forming as it did a boundary, had a good deal to do with it. Animals were not allowed to cross the bridges from one part to the other, and it was hardly likely that any swam the river. He believed they could have pleuro without any contagion whatever. It was nothing more than inflammation of the lungs, and might be caused by ordinary atmospheric influences. He could not go so far as Mr. Davies, who said that the importation of foreign stock had raised the price of beef by 7 per cent. The real question was, could farmers feed more than they did at present? He should doubt that very much. He thought that every farmer, supposing him, of course, to have the necessary capital, stocked his farm properly, and got as much cattle upon his farm as he could keep, and if he got more than he could keep the stock would only become deteriorated. He thought the letter read by Mr.

Burton, evidently from a gentleman who had the means of judging for himself, showed that every means that could be devised were taken by the Government to prevent the introduction of disease, and that being so, he did not see what more they could desire in that respect.

Mr. KEARY, in reply, said that the Club was much indebted to Mr. Burton for the valuable information he had been the means of procuring them in the letter he had read, and he (Mr. Keary) hoped the same stringent means would be adopted to prevent the spread of disease in this country, which it appeared were adopted to prevent its introduction from abroad. Jobbers were a very useful body of men—

The CHAIRMAN: Rather unscrupulous at times, though.

Mr. KEARY: They were, perhaps, at times rather unscrupulous, and were certainly not so careful as they should be, and so were often the cause of much mischief. He thought the present Government were taking all the precautions they could call upon them to do, and he did not think, after hearing Mr. Burton's announcement, that they were in a position to call upon the Government to do anything further as to foreign stock. He thought, however, something was needed at home, in the rural districts especially. He repudiated the idea of employing policemen as inspectors, urging that they should have men more experienced in the detection and identification of disease. He disagreed with Mr. Davies as to the rise in the price of beef being caused by the introduction of foreign stock. How, he would ask, had the population of this country increased of late? And besides that, people were now in a position to eat meat, who years ago could not, in consequence of the lowness of wages, afford it.

The meeting terminated with the usual vote to the chairman

THE SHROPSHIRE CHAMBER OF AGRICULTURE.

The ordinary monthly meeting of the committee of the Shropshire Chamber of Agriculture was held at the rooms of the Chamber in Shrewsbury, Mr. Bowen Jones, vice-president in the chair.

The CHAIRMAN stated that the first business of the meeting was to decide what steps should be taken in Shropshire, by the formation of a local committee or otherwise, to assist the Local Taxation Committee appointed by the Central Chamber. The committee had been appointed by the Central Chamber two years ago, and of it the Rev. Mr. Pigott, of Newport, and Mr. Jasper More were members. It had been the means of doing much good, but its efforts were curtailed a good deal by the want of funds. The secretary of the committee had written a treatise upon Local Taxation, which in his (Mr. Jones's) opinion was unanswerable, and which was well worth the perusal of everyone interested in the question. That committee had no doubt done much good, but they seemed to think that still more might be effected if the different Chambers were to appoint local committees to assist them. There was no doubt that the towns needed "educating" on that question. The borough members at present took no interest in it, whereas the county members were being stirred up very generally. If the boroughs were shown that their interests were concerned as well as the counties', they would then get the assistance of the boroughs. He saw one or two county magistrates present, and he should like to know what had been done at the county sessions on Monday. If no steps had been taken he thought they should solicit the court to move in the matter. They might, too, get at the different Boards of Guardians a little better than they did at present. They did not enter into that question as they should do; with the exception of the Wellington Board, no other Board in the county had petitioned Government upon the question.

Mr. STANLEY LEIGHTON said a petition had been agreed to at the Court, on Monday, and would be presented to Parliament. The Court only spoke as to the county rate, and they held that Government ought to give more support to the county than it did at present, and that the area of rating ought to be extended to woods and metallic mines, which were at present free from the rate. Their object was to create an opinion among the public, and if they did that, it would soon

find an expression in Parliament. He agreed with the chairman, that they must not trust to the county members alone—they must try to bring the borough members to see that they were alike affected by the question.

Mr. R. JASPER MORE said what the central committee wanted chiefly was money.

The CHAIRMAN said the funds of the local Chamber were in a satisfactory state, but he saw no reason why the large owners of property should not have the opportunity of contributing as well. It had been done in other places.

A local committee was formed to co-operate with the central committee.

The CHAIRMAN read a letter from Mr. Howard, M.P., showing the condition of the French agriculturists in consequence of war. The Chairman added that there was no doubt the French agriculturists were suffering to a very great extent, everything being destroyed by the advancing Prussian armies. He had very little doubt that if assistance was not sent over soon the utmost desolation would ensue, and he suggested that the public be solicited for subscriptions both in money and in seed corn.

Mr. LEIGHTON pointed out that England was neutral in the present war, and our sympathies, therefore, ought to hang equally between the two. He thought they should consider this before proceeding to help either nation alone.

The CHAIRMAN said he should have been prepared to help Prussia, in precisely the same way, if it had been invaded instead of France.

The Rev. Mr. PIGOTT pointed out that agriculture in Germany proceeded much as before the war; at any rate it was not injured to the same extent as in France, and there was no need to aid Prussia.

The CHAIRMAN stated that in distributing the corn sent care should be taken that it was used as seed, and not as food for the contending armies.

It was agreed that the committee receive subscriptions on behalf of a fund to be raised for the purpose named.

A petition to Parliament embodying the views of the Chamber in regard to Local Taxation was agreed to.

A petition in favour of County Financial Boards was also agreed to.

TENANT-RIGHT.

At a general meeting of the Banbury District Chamber of Agriculture, the Rev. C. W. Holbech in the chair,

Mr. DUN reported that he had attended the meeting of the Central Chamber on the 7th of December, and the business was principally of a technical character, a good deal of discussion taking place with regard to its constitution, an opinion prevailing that the Chamber ought to be purely a representative chamber, and that the knowledge acquired throughout the country should be focused, as it were, in Salisbury Square. Complaints were made that the provincial Chambers were not represented sufficiently at the Central Chamber.

Mr. COTHER said: The last time I addressed you on the subject we are met this day to consider, there was only time for very cursorily considering it, but I have now an amount of information which I trust may lead us to just and right conclusions, no less to the benefit of the landed-proprietor and occupier, than the labourer, who must be the first to benefit by the universal adoption of the reasonable and just principle of giving security to tenants for the use of oilcake on their farms in such proportion as may be considered beneficial to the incoming tenant. In the first place, the foreign labourer will be benefited by the increased demand for linseed; the home labourer, in like manner, by the increased demand for the cake by the loading, unloading, breaking, and serving out, shepherding, producing and stocking of corn, thatching, thrashing and winnowing, and all other labour required in consequence of increased production; the tenant, by security given whereby much larger crops of roots and grain may be raised; and the landlord ultimately by the increased value of his land, and the consumers of meat benefited by its larger productions, so that much land not now well farmed "may bud and blossom as the rose." To induce this principle in detail, I would propose that the cost of cake for the three last consecutive years of a tenant's holding (the amount being equal in each year) be divided by six, the value of the said sixth part to be paid by the landlord or the incoming tenant; this to be ascertained by the valuers appointed in case of acts of husbandry, the outgoing tenant producing vouchers for confirming the same. In case of the death of a tenant, or his not holding a farm for three years, the allowance to be decided by the valuers as above, or their umpire, I have now to propose the following motion: "This Chamber respectfully recommends all landed-proprietors to adopt the principal set forth as above as the greatest encouragement to high farming generally, and consequently to the increased value of land—not overlooking various other improvements, but leaving those to be provided for by special agreement between landlord and tenant."

The CHAIRMAN: Does the question about oilcake form one of the leading principles of Lincolnshire Tenant-Right?

Mr. COTHER: There are other covenants, but this is the most important. It is a good principle, and injures nobody. I am indebted to Mr. Torr, who was one of the judges at the Royal show, and who has given me a great deal of information on the subject.

Mr. DUN asked Mr. Cother if he knew the agreement about artificial manure?

Mr. COTHER read an extract from a lease which had been sent to him by Mr. Torr, from which it appeared that the tenant received the whole he expended on manures if no benefit had been received; if he left in a year, half of their cost; two years, a fourth; and three, nothing. He had only dealt with the cake, and he had been informed by a most experienced man the cake question was the most important thing in the system.

Mr. SIMMONS said that in dealing with Tenant-Right they must take into consideration that a man must have a large amount of capital on entering a farm, in order to pay for the improvements that have been made for several years.

Mr. GREAVES said that men without money got farms by offering high rents for them, and if they did not succeed in them, there was always plenty for the landlord on the ground.

Mr. WESTOVER said that as long as there were such a number of people applying for farms, that would always be

the case. A man told him that farming was surely the best business in the world, there were so many applicants for farms. He (Mr. Westover) told him that he thought it arose from small farms being merged into large ones, from people making their sons farmers, and from commercial gentlemen taking farms for their amusement, and throwing out the yeoman. He was in favour of embracing lime as well as cake in the compensation for unexhausted improvements.

Mr. DAVIS did not think Mr. Cother went far enough, and he, too, thought lime should be embraced. Most land required lime, and they would get more benefit from the second cropping with lime than the first.

Mr. DUN said they were much obliged to Mr. Cother for bringing forward a subject of so much importance to the agricultural community generally, and the principles he enunciated must recommend themselves to all who had any experience whatever in regard to land. There was no doubt that land had not hitherto drawn nearly so much capital as could profitably be applied to it. No doubt both landlord and tenant required to lay out more in thorough drainage, making roads, and proper fences, &c., and also, perhaps to a still greater extent, tenants had been chary in laying out their money in the deep and thorough cultivation of their holdings. The tenants had not been to blame in not laying out their money on their farms, and they could not, in justice to themselves, lay out a large amount of capital when they had so slight and insecure a tenure of their farms. He was thoroughly satisfied that land, to be farmed highly, and as well as they wished it to be farmed, to yield the greatest amount of capital, to rise rapidly in its permanent value, and to yield the greatest advantage to the owner, must be held upon a somewhat different system than it had hitherto been in the greater part of England. There should be payment to the enterprising tenant for unexhausted improvements—for the capital he had spent in improving the land, and of which he did not get the advantage—and he thought they must adopt the system that prevailed in the northern part of the country, where the tenant secured a permanent interest in the land by getting a lease of it for at least fourteen years. He believed that the best resolution they could pass would be obtained by a combination of the two systems—by allowing the tenant to have a lease for a reasonable term of years, and also by giving him an interest in the outlay of his capital by repaying him for the capital which he left in the soil, and for which he had not been repaid himself. He did think, with all due deference to Mr. Cother, that they as men of business, and practical men, should look at the subject in its fullest bearing, and not merely in its relation to the question of linseed cake. He therefore begged to propose the following as an amendment to Mr. Cother's motion: "That in order to encourage the application of capital to agriculture, it is desirable, 1st, That greater security and permanence be given to the occupiers of land; 2nd, That outgoing tenant be repaid by the landlord or incoming tenant for the unexhausted improvements made by his capital, and also for a proportion of the cake, corn, and manure recently purchased for and expended on the farm." He thought that two such systems would draw a much larger amount of capital to the land, and also benefit the labouring population of this country. One of the great questions of the day, was, What were they to do with the increasing pauperism? If the land was held upon a more certain tenure than at present, that pauperism could be very greatly diminished. There was no doubt whatever, as Mr. Cother had said, that wherever men were farming up to the mark, wherever they met with thorough good cultivation, and where a large quantity of stock was kept, there was certain to be a large number of hands employed. At present, owing to the light profits that had of late been derived from agriculture, farmers had been anxious to do with the smallest number of hands they could. By adopting leases with compensation for unexhausted improvements, they would have smiling Plenty over a vast area of this country, and they would have far more and full employment at all seasons of the year for the industrial poor.

Mr. COTHER: Mr. Dun is quite beside the question.

Mr. DUN (handing Mr. Cother the circular calling the meeting). The question is printed, "Lincolnshire Tenant-Right."

Mr. COTHER.—Lincolnshire Tenant-Right does embrace leases. Mr. Torr says that he would not have a lease. I consider there are many objections to leases, and I don't believe in binding men together for fourteen years. A man might see something better elsewhere, but he could not move, being bound by a lease. I consider that the proposal to allow for cake is one of the utmost importance.

The CHAIRMAN, looking at it from a landlord's point of

view, did not think much of the lease system. He might give a man a lease for fourteen years, and find afterwards that he was a very bad farmer, that there was no prospect of his improving, and he would not be able to get rid of him until the expiration of the lease.

Mr. GARRETT did not think that Mr. Cother went far enough.

Mr. DAVIS seconded Mr. Dun's amendment, and it was carried by six to four, upon which Mr. Cother said that the long and the short of it was that they were not willing to take any compensation.

A vote of thanks was given to Mr. Cother for his paper.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

At a monthly meeting of the directors held on Wednesday in their chambers, George IV. Bridge, Edinburgh, the following letters were read:

Bonnington, Ratho, Dec. 26, 1870.

Dear Sir,—You kindly mentioned you would submit any remarks I had to make on Dr. Anderson's report to the directors. Allow me to do so now. 1st. From the enclosed letter from a mercantile firm in Germany, who undertook to make inquiry for me, it appears the Doctor's information is not quite correct when he says all scientific work has been put a stop to by the war. The various institutions are in working order in Saxony and Bavaria. 2nd. The statement made by the Doctor that there are twenty different establishments in Germany, supported chiefly by private funds, for the purpose of determining fundamental laws of agriculture and applying these to practice, is fitted to surprise agriculturists in this country, where no such institution exists. After Boussingault's private establishment at Beohebrunn, in Alsace, the Agricultural Chemistry Association of Scotland was the first, I believe, to be formed of the class. That institution was started by a practical farmer, the late Mr. Finnie, Swanston, aided by Mr. Oliver, Lochend; Mr. Milne Home and Mr. Coventry assisting. Its objects "were to improve agriculture by the application of chemistry, vegetable physiology, and geology, enlarge present knowledge by experiments in the field and laboratory;" "to diffuse such knowledge," and to analyse manures and feeding stuffs, soils, &c.; apparently such work as is being done by these German institutions. When the five years expired for which the association was formed, it was taken over by the Highland and Agricultural Society, "for the purpose of encouraging and directing the application of science to agriculture." The effects which followed the formation of the association was a rapid increase in the demand for artificial manures, the making of which—the happy thought of Liebig of dissolving bones with sulphuric acid—rendered possible a correct system. Much was done to check quackery and knavery in the manure and feeding-stuff trade. It is generally allowed that the operation of the chemical department of the society has not done much "to enlarge our knowledge of scientific agriculture." Dr. Anderson says little has come of all his attempts at the utilisation of refuse matters, and he holds up no great prospects of being able to achieve much more. He, however, gives the farmer the assurance that "the manufacturer will bring under his notice every sort of refuse which can be useful to him." The Doctor thus appears to admit that the manufacturer is a much greater benefactor to the farmer than the chemist, and can succeed when the chemist fails. If such, then, has been the result of the working of the chemical department, some one may be apt to ask the question, What is the use of that department, as chemical analyses can be had as correctly and on the same terms elsewhere? Besides, the fact that the laboratory is in Glasgow, and the whole east of Scotland deprived of ready access to it, has caused other means of obtaining scientific information to be resorted to, as in the West Lothian Chemistry Association and others. The expression of opinion in the report that matters are in a satisfactory position seems to me and others to strengthen the call for further information; and we daily see that the Doctor is not correct when he says all waste substances are utilised, and that the manufacturer will take care of them. For instance, from where I write I can overlook a district of country some

eight miles by six, where much paraffin is made, the ammonia water from which was allowed to go to waste. Many experiments were tried by Mr. M'Lagan of Pumpherstone, M.P., and other agriculturists to apply it to agriculture; and some progress has been made in converting it into sulphate of ammonia, if not directly into a manure; and from one large work about £20,000 sterling is sold annually. Nearly as much is made in other works. Yet it is calculated that ammonia and other matters which would return £30,000 if utilised are allowed to pollute the streams. I am not aware that Dr. Anderson has ever turned his attention to the utilising of this great waste. Within a few miles of this, there are several mills which manufacture oatmeal largely for the Glasgow market. The oaten shavings until lately were burnt as unfit for manure or food. These hard dried husks are now carefully collected, and sent to the railway stations, a few shillings a ton being got for them; whereas at their destination it appears that they are made to assume the form of organic matter in various compositions, which sell at high prices to the farmer, and chemists, from want of sufficient skill, are unable to trace them. The boon the manufacturer supplies in this case is not quite apparent. I shall not give other instances from a distance. But the fact is undeniable that were greater scientific skill to exist or be available, not only would agriculturists benefit, but they would be able in their management and application of manures and feeding-stuffs to save money. A thorough reorganisation of the chemical department of the society is urgently required; and my only plea for troubling your directors is a feeling that while, as practical farmers, we have few who excel us, we are not keeping up in science as applied to agriculture.—I am, &c.,

(Signed)

JAMES MELVIN.

F. N. Menzies, Esq.

Lauf, by Nurnberg, 5th Dec., 1870.

Dear Sir.—We are now in the position to reply fully to your note of information, having gathered the necessary particulars from authentic sources. Answer 1. The various Agricultural Chemistry Associations in Bavaria and Saxony are all in working order. Answer 2. The schools and laboratories are: in Bavaria the Agricultural Central School at Weiheursephan. Director—Carl Gustav Wenz. Laboratories: in Saxony—(a) Landwirshechaftliche Verouchr Station, at Pommeritz, near Buntzen; (b) Landwirshechaftliche Verouchr Station, at Moeckern, near Leipzig; (c) Agricultural Academy at Tharandz (of very high standing, and near Dresden, the first in importance in Germany). Directors—Mr. Schober, professor; and Professor Stockhardt. Professor Stockhardt is considered a high authority in agricultural matters. Answer 3. Guano manufacturers—In Bavaria: Fabrik Henfeld, between Augsburg and Munich; in Saxony: Pommeer and Co., at Plagwitz, near Leipzig; Albert and Hortel, at Dresden; Gall and Co., at Freiburg. The manures are not manufactured according to the directions of Government chemists; but the manufactory at Henfeld gets their produce tested by chemists of high standing, and Professor Liebig, of Munich, has a share in it. Answer 4. Application to inspect the above-named establishments should be made—In Saxony: Dr. Reining, General Secretair and Geheinic Rath, at Dresden; in Bavaria: Director Wenz, at Wesenstephan. Answer 5. The best time for a deputation would be in summer. We may mention for your guidance that Saxony will be the most important part of Germany for you to visit, for it is the best cultivated, and much progress has been made. There is also an Agricultural

School and Laboratory at Hohenheim, in Wurtemberg. We shall be happy to get any further information you may desire; and trusting that the foregoing will be what you wanted, We are, &c., &c.,

(Signed) J. F. BARTH AND WEIGHMANN.
James Melvin, Es., Bonnington, Ratho.

In consequence of approved reports having been received various subjects on the list for 1870 were discontinued. The following new premiums for reports were added: On the agriculture of Orkney; on the insects which prey upon agricultural plants and the diseases occasioned by them, with reference to finger-and-toe in turnips, tulip root in oats, smut in corn crops, failure of the wheat plant in spring, &c.; on the waste chemical products and new combination of substances which might be made available for agricultural purposes; on experiments with potatoes grown with potash manure; on the symptoms, causes, preventive and remedial treatment of abortion and premature birth in mares, cows, and ewes; on the natural history of the sheep tick; on the effects of dry season (1870) on trees and shrubs; on the *Wellingtonia gigantea*; on the stem and branch pruning of conifers; on the more extended cultivation in Scotland of charcoal-producing plants for gunpowder or commercial purposes; on the woods, forests, and forestry in the county of Perth; on the planting of peat bog.

Mr. F. N. MENZIES reported having attended a meeting at Kelso on the 16th of December, regarding the show in 1872, when the classes of stock as named by the directors had been approved of, subject to the following additions:

That in the fat stock class there should be two sections for Shorthorn oxen calved after 1st January, 1869, and after 1st January, 1870, and that the polled oxen should be included in the sections of any other pure or cross breed.

That there should be two classes of Leicester sheep—viz., English and Border—and that the same number of prizes should be given in the one class as in the other.

That the extra sheep sections (which the directors had remitted for the meeting to name) should be for Cheviot wethers not above three-shear, blackfaced wethers not above three-shear, half-bred hoggs not above one-shear, and greyfaced hoggs not above one-shear.

That ewes in the Cheviot and blackfaced breeds should be shown without lambs, for three reasons: Many of the lambs did not belong to the mothers shown, but were nursed by the bottle; the feeding they got was detrimental to breeding purposes, and showing on other occasions; because the practice was followed out in no other class of ewe stock.

That there should be more encouragement given to implement makers, and that there should be a thorough trial of implements previous to the show.

The board approved of the various suggestions with the exception of the last, which they considered was sufficiently met by Nos. 50 and 51 of the general regulations, namely—

50. The Inspecting Committee will award such silver medals as they may deem proper for general collections, new inventions, or radical improvements, where a trial is not practicable.

51. When an implement or machine is supposed to embrace a new invention, or radical improvement, the nature of such must be specified in the entry, to enable the directors to order an inspection with a view to a trial. Such trial, when recommended by the Inspecting Committee, will be instituted in a convenient locality, and at a season of the year suitable for the operation of the implement or machine, which, when thoroughly tested, will be entitled to such a premium as the directors may see fit to award, on the report of the judges employed by them.

THE HOP PICKER.

The annual meeting of the Society for the Employment and Improved Lodging of the Hop-picker, was held at Maidstone, the president, Earl Romney, in the chair.

The Rev. J. Y. STRATTON, the Secretary, read the fourth annual report, as follows:

In presenting their report, the committee of management of the Society have to state that the accounts for 1869 were audited and found correct. On the order of the committee, they were printed and circulated among the members. A balance in favour of the Society of £1 11d. was carried to account for the present year. This is a smaller sum than that which was in hand at the commencement of 1869. The cost of the last report, including in its appendix the report of the Royal Commission on the employment of children, young persons, and women in agriculture, relating to the immigrant hop-pickers of Kent, caused an unusual addition to the expenses of the Society, and will account for the reduction in the balance. The accounts for the present year will, it is calculated, show that as in previous years, the funds of the Society are equal to the demands likely to be made upon them. The present number of members is 95, being two less than at the date of the last report. Among those members who have been removed by the hand of death, your committee have to record the loss of Mr. Charles Wykeham-Martin, M.P., who aided in the formation of the Society, and, as a vice-president, took an interest in its progress. The Society will also regret that the distinguished name of Charles Dickens will no more appear on the list of members. The loss of Mr. Alexander Randall, of Maidstone, who joined the Society on its formation, is also to be noticed with regret. The report of the Royal Commission above-mentioned on the state of the lodgings and management of the hop-pickers of Kent, has been extensively circulated by the Society. It has not, however, met with the attention to which it is on every account entitled. Your committee express their belief that the friends of the reform in which the Society is engaged would find in the evils therein recorded, as well as the suggestions for their remedy, matter, by the proper use of which employers who have hitherto been negligent about the lodging and accommodation of their hop-pickers may, without the intervention of the law, be led

to make good provision for them. Your committee appeal to the influence on public opinion exercised by the press, to aid in the effort to induce owners and occupiers of hop lands to make alterations in the lodgings by which the morality and decency of their inmates may at least be encouraged. That great improvements in this respect have already been made is matter for congratulation, but much remains to be done. The paper of "Recommendations relating to the Lodgings," drawn up by a committee of the Society in 1867, may be referred to with advantage by persons who are about to build or improve the "hopper-house." The evil of overcrowding should not, however, be lost sight of by those whose lodgings are good. [Great complaints were made by the occupants of a hopper-house in Watlington on this point. They were crowded 25 in each room without reference to age or sex.] While the influence brought to bear by the Society on improvements in the lodgings has been most salutary, your committee has devoted continued attention to the agencies by which hop-pickers may be engaged. The difficulty pointed out in the commencement of the Society's labours in obtaining the hearty and general co-operation of the hop planters in the use of the agencies still remains; though partly from improvements in the management, and partly from the desire of some of the growers to support an effort which aims at establishing system and due control in lieu of disorder, the indifference to the Society's agencies is less than it was. The number of hop-pickers supplied this year compares favourably with that of any former year, being 580, or 170 more than last year. The increase, though the whole number is comparatively small, is progressive. No complaint whatever has been made of the conduct and efficiency of the Society's hop-pickers. Your committee invite the attention of hop planters to the statement that engagements made by means of the Society are not allowed to displace orderly and efficient hop-pickers, who in former years have found employment through the objectionable agency of the binmen. On the contrary, they are always retained for the same employer, while persons of unsatisfactory conduct are dismissed by the agent in charge. The Society endeavours to introduce into common use a system which shall secure to the grower, at a small cost (3d. per hop-picker), and

at no cost to the work people, efficient hop-pickers in any number required, with due regard to their comfort and decent provision. By means of the Society's system, the trouble of the hop-grower in securing pickers is greatly diminished; the hardships inflicted on persons who leave their homes in search of work before any is to be had are removed, inasmuch as they remain at home till the agent informs them of the time when and the place where to go, and also sees them off by train in all cases where they can afford to pay the fare. A powerful check upon vagrancy (by which the unions and charitable people will be gainers), will be secured as soon as the agency becomes the common mode of engaging hop-pickers. The co-operation of the hop-growers is earnestly sought on behalf of a system which will sooner or later benefit hop-growers, hop-pickers, and the resident population of Kent. The agents of the Society have again rendered good service at the railway stations. At Watlingbury, where the bulk of the Society's hop-pickers come and go, the assistance of the agent was especially valuable. Railway tickets were purchased by him, and sold at the pay-table of the employers when the hop-pickers came to receive their money, by which means much inconvenience at the station was avoided. The cheap trains for hop-pickers on the South-Eastern Railway from London, commenced running many days before the hops were ready. In consequence, numbers of persons in London, who look on the Company's announcements of hop-pickers trains as the signal to leave their homes, started on foot and begged their way into the district; these, as well as the earlier travellers by rail, "remained in a half-starving and vagrant condition, sleeping by nights in the casual wards, and in the day roaming about in search of food and employment." With this exception the South-Eastern Railway Company have been fortunate in their arrangements for the people, and no cause of complaint has been given from the want of a sufficient number of trains to convey them home with due expedition. The following return has been kindly forwarded to your Committee by the South-Eastern Railway Company:

Hop-pickers from London by Special Trains.	Returned by ditto.
1865 ... 11,090	12,000
1866 ... 11,000	13,000
1867 ... 8,777	10,694
1868 ... 14,476	17,288
1869 ... 12,522	13,458
1870 ... 15,945	16,915

No account is taken of hop-pickers who travel by ordinary trains.

Total acreage returned as under hops, in each of the years 1868, 1869, and 1870, to the board of trade:—

	1868. Acres.	1869. Acres.	1870. Acres.
Hants	2,517	2,356	2,530
Hereford	5,564	5,536	5,798
Kent	41,087	38,606	37,490
Surrey	2,208	2,209	2,152
Sussex	10,107	9,613	9,445
Worcester	2,430	2,522	2,606
Other districts	542	561	559
Total for England ...	64,455	61,403	60,580
Wales	33	6	14
Total	64,488	61,409	60,594

The land under hops, according to the Excise returns in 1861, was 49,941 acres.

The following were appointed agents of the Society for the present year:

Maidstone	Mr. Raggett, Chief Agent.
Lambeth	Mr. Knight.
Bermondsey	Mr. Leach.
Golden Lane, E.C.	Mr. Hutchinson.
Westminster	Mr. Lucas.
Seven Dials	Mr. Gyton.
Woolwich	Mr. Leach.
Deptford	Mr. Thos. Tassell.

The statement of accounts showed an expenditure of £54 4s. 1d., and a balance of £1 11d., in the hands of the treasurer.

The Rev. J. Y. STRATTON, the secretary, said he had generally contented himself with reading the report to the meeting, but he asked permission on the present occasion to say a few words about the Society. He considered that great injustice had been done the Society by overlooking the moral force it had exerted in inducing employers to provide improved accommodation to the pickers. If the Society had never attempted to establish its agency, it had earned all the money which had been subscribed towards it, by the influence it had exerted upon the hop-planters in reference to these dwellings. Lord Derby had expressed an opinion that the Society might possibly succeed in "registering" hop-pickers, but would not exert much influence in the way he had described; but he could state with confidence that he was decidedly wrong in coming to that conclusion. He contended that the Society was fairly entitled to the cordial support of the hop-planters, and although it was sometimes difficult to get a principle—however true it might be—recognized, yet he believed the time would come when this "agency" principle would make its way into common use. It might be true to a certain extent that the hop-planters could manage their agencies for themselves, but for the public good he would urge them to co-operate with the Society. The Society was now in a position to manage with ease, by means of its agencies, over 5,000 hop-pickers, and without wishing to displace any pickers he would ask planters generally to employ their hands through the Society's agencies, and by that means secure a check which was often wanted in the best managed gardens, in being able to get rid of noisy and turbulent people, and substituting in their place those over whom some control would be exercised.

The CHAIRMAN said he had purposely spoken rather disparagingly of the Society, in order to elicit what could be urged to the contrary. It was a waste of time to support an institution of this kind unless it was really and thoroughly carrying out the objects for which it had been started. The progress it had made was less than he had hoped for five years ago, and there was no doubt but that, so far as the hop growers were concerned, it had not made much way. He hoped to see a change in this respect soon, but he quite endorsed the opinion expressed by the secretary that the Society had exercised a moral influence which was overlooked; in fact, he quite believed that a great influence—unknown to most people—had been operating in consequence of the way in which the subject had been agitated.

The report was then adopted unanimously.

Mr. EDWARD GOODWIN proposed the following gentlemen as officers of the Society for the ensuing year: President, the Earl of Romney; Vice-presidents, the Lord-Lieutenant of Kent, Viscount Sydney, G.C.B., the Earl Stanhope, the Earl of Darnley, the Earl of Abergavenny, Mr. James Whatman, M.P., Major-General Fletcher, Mr. Henry Bannerman, Mr. J. Wingfield, Stratford; Treasurer, Mr. R. Mercer; Secretary, Rev. J. Y. Stratton, Ditton Rectory, Maidstone. The Society had done a great deal towards the improvement of hop-houses, but there yet remained much to be done in this direction. If only £100 was expended beyond what had already been expended on farms of fifty acres or so it was impossible to conceive how much it would conduce to the greater comfort of the people. With regard to "cook-houses" he complained that there was a great deficiency; "ovens" ought to be provided on every farm. On his farm there had been an oven for over forty years, and he described how much it was appreciated by the pickers whom he employed.

Mr. ARTHUR FREMLIN, seconded the resolution. He regretted that the hop planters failed to co-operate with the Society in reducing the evil which all must acknowledge now existed, an evil from which all suffered—the thousands who came annually to this locality, and by having, perhaps, to wait a fortnight or so before finding employment, were reduced to a state of starvation and distress which might easily be avoided if the agencies of this Society were made use of. In talking to his hop planting friends they generally wished to know why they should depart from the old system which had been in operation so long. His answer was because it had worked badly. The Society wished to see a better state of things established, and he described how much more convenient it would be for the planter to procure the pickers by the agency of this Society than to engage them on his own responsibility.

The resolution having been carried, on the motion of Mr. T. H. PACK, seconded by the Rev. J. Y. STRATTON, the following were appointed to act with the officers as a committee of management: C. G. Whittaker, J.P., T. R. Cutbush, Thos. White, S. Maitland, Thos. Balston, J. J. Ellis, J.P., John Whitehead, J.P., Chas. Whitehead, J.P., W. Gilbert, T. D. Shafto, R. Alexander, C.B., J.P., A. Peppercorne, H.

Peppercorne, J. H. Hodeoll, E. T. Goodwin, R. Betts, W. A. Fremlin, A. White, and W. Hammond.

The CHAIRMAN, in acknowledging a vote of thanks, said it appeared to him that planters might easily avoid being considered unkind to the pickers if they gave them notice in 1871 that in the following year they would be engaged only through the agency of this Society.

ROMSEY LABOURERS' ENCOURAGEMENT ASSOCIATION.

The annual meeting for the distribution of the premiums to the competitors for the prizes under the auspices of this society was held in the Corn Exchange.

The Right Hon. W. F. COWPER-TEMPLE, who is president of the Association, said he had great pleasure in distributing the premiums that had been awarded, for he knew they had been given with the utmost fairness and discernment by the judges who had to decide. It was always pleasant to see a number of persons who had done well in their respective positions in life. Each of these premiums was an evidence of well-doing—a proof that the persons who received them had been careful to learn their duty, and had been faithful in the discharge of it. It was pleasant to see an example of right-doing proceeding from right feeling, whether on a large or small scale. It does not depend upon us (he continued) what position in life we should be placed in. It depends upon circumstances, upon the complications of society, the orderings of Divine Providence; but what does depend upon us is the way in which we act in the positions in which we are placed. Shakespeare has said, "All the world's a stage, and all the men and women merely players." When a play has to be acted the parts are distributed among the actors, and it is not of much consequence to an actor whether he has to play the part of a king or citizen, a general or a soldier, whether he wears tinsel and gold crowns or a simple buff jerkin; what is of importance to the actor and to the audience is the manner in which he plays his part. And so it is in this great theatre of the world. It is not of so much importance what position is allotted to us, whether it be one of wide power or small extent; but what is of importance—and of the utmost importance to each person—is whether they do their duty in that particular position in which they are placed or not. The well-being of society itself depends upon everybody doing well in the particular part of the social scale in which they happen to be placed. All of us here belong to the agricultural class—the class whose business it is to bring out of the soil that food which God fitted it to produce. The agricultural classes may be divided into three chief branches. First, the landlords, who prepare the land for cultivation, who divide it into farms and fields, who drain the land and build the farmhouses, stables, and cottages upon it, and their business is to see that the land is turned to good account for the general good of the nation. The second branch are the farmers, who have to provide the plant of the farm, the implements, machinery, wages, all the outlay that has to be made; they have the risk, and we hope sometimes they have the profit. The third class are the labourers; they plough, sow, hoe, dig, reap, and do everything in manual labour that is required for the production of the farm. About three weeks ago we had competitions in this town among the farmers as to which had done best in producing articles worthy of admiration. We had a very splendid show, and several gentlemen who are present to-day were successful in getting prizes. There was Mr. Hoddinott, who got the first prize for ten acres of swedes; then there was Mr. Withers, who got the next for a most admirable field of swedes; Mr. Swanton, Mr. Hunt, and I myself got a prize; and I am pleased to think that Broadlands Home Farm produced most beautiful pigs, which also got their prizes. Now to-day it is the turn of the labourers; they have been competing for prizes, and I am pleased to see so many people who, by the decision of the judges, have got the rewards which they well deserved. The first class of shepherds is in many respects the most important of the lot, for upon them depends much the health of the lambs and ewes—upon their good management, care, and constant attention. We have six or seven shepherds who

have been strongly recommended for good conduct, and special skill in the work which they have performed. In the class of teamsmen prizes have been given to three men who have deserved them by a considerable number of years' services. A great deal, we all know, must depend upon the care of the man who drives these animals. He has got not only to feed and water his horses, but to be kind and considerate in his treatment of them. A good carter is a man who tries to manage his horses by kindness, who understands what they are able to do, and who does not overdrive them, and he is especially one who, when he has to bait his horses at a public-house, does not bait himself to any extensive degree, but is moderate in the refreshment he is required to take. The other class is that of the ploughmen; these are they who require the most skill, and whose skill is the best tested. We have had a great number of ploughing matches lately; they have been well contested, and there have been furrows drawn in this neighbourhood as straight and even as any in the country. You must therefore think well of William Fielder, who is the champion of you all. The other class is for seedsmen and drillmen, and upon their work a great deal of the success of the farming depends. It is a matter of considerable skill, and I am glad to see there are so many who are worthy of the premiums. So also with the rickmen and thatchers. This is an employment not so well carried out as it used to be, and it requires all the attention that can be paid to accomplish it in the best way. Then there is the class for domestics. These have received at home a much greater reward than the association will be able to give them, for a servant who gives satisfaction to her employers has the reward not only of doing her duty, but of receiving the approbation, affection, and regard of those who employ her. With regard to the cottagers, we have the pleasure of seeing the mistresses as well as the misters, and I am sure these prizes are earned as much by the wife as by the husband. These have an ample reward in keeping their husbands at home, and making them contented with their lot. I should like to see a prize given to the wife who could make the best pudding or soup for her husband. We have a great many vegetables, but I do not think they are made the best use of. Then there is a prize for the gardeners, and I think again it is not necessary for me to dwell much upon the usefulness of the premium, because a well cultivated garden is the best reward that can be given in itself; and in many places they reckon the produce of only half a quarter of an acre is worth about £4 a year. Then there are the special class of prizes awarded to those who, from long service, have been able to bear a very good character, and there are several of these who deserve great credit for what they have done. Finally, we have those who have received the Bible, awarded by the present Bishop, as by his predecessor, and the prayer-book, and these will both be great proofs of good conduct to the owners. I do not think it necessary for me to give you advice, because your presence here to-day shows that you are each of you in your respective positions well behaved, honest, and respectable people, but there is one thing I hope the fathers and mothers will do, and that is to take care that their children go to school. Since this meeting last year, Parliament has been very busy, and it spent 20 days in the course of the session last year in providing that the education of the working classes of this country should be such as it ought to be. A law is passed now by which a seat in the schoolroom shall be at some time or other provided for each child. In this neighbourhood there

are plenty of good schools, and it is not the fault of the schools if the children are not educated, but it will be a hard thing if, while all the country is thinking about the education of the working classes the fathers and mothers, who are most interested, are the only people who do not care about it. I therefore hope all of you, so far as your influence extends, will do what you can, so that the poor children growing up will not be left without schooling. Next year I suppose we shall have Parliament considering the question of licensing public-houses, and trying to arrange that men may get their beer in the least inconvenient way, getting what they want without being exposed to the temptation of taking too much or being led into bad company. For my own part I am a great advocate for what are called working men's clubs—places where men can go of an evening if they have to leave their homes—of course it is better, if they can stay at home, to do so, for the proper place for a man is by his own fireside—but it would be a great advantage to young men, at

any rate, if they could always have a room well lighted and warmed, where they could go and sit of an evening with the newspapers, and be allowed to smoke a pipe without the necessity of drinking beer in the house. In a great many villages, as well as towns, in this country there are flourishing places of this sort, where working men go and sit in a room of which they are the masters. But the great thing depends upon the home being made comfortable, and attention to the husband, and I hope the wives present set a good example in this respect. On behalf of myself and the friends and subscribers of this society, I may say that we are pleased to see you here to-day. We hope many of you will be here to get premiums another year, but whether that will be the case or not we are exceedingly pleased to know that there are in this neighbourhood so large a number of persons who have done so well, and who have set such an example to their neighbours, friends, and acquaintances.

FARMERS' CLUBS AND CHAMBERS OF AGRICULTURE.

The activity of Farmers' Clubs seems to us the most striking feature of current agricultural history. There is nothing like it in any other profession. To be sure, no other professions number so many members on a given area of the country, but this is not true of them as congregated in our large towns. Where, however, will you find elsewhere that constant activity of the professional mutual improvement principle, whether in town or country, which one witnesses continually in agriculture? Every locality has its ploughing match and club, every market town its monthly meeting for discussion, every county its annual show, every province its great summer meeting, and each of the three kingdoms its national gathering and exhibition. And as if these were insufficient to satisfy the appetite for social co-operation, there has grown up another great organisation within the last two years, and Chambers of Agriculture have everywhere been constituted for the purpose of ascertaining the opinion of the agricultural body on public as well as professional questions, and of thereafter urging that opinion wherever it may best bear fruit. And certainly there is no lack of energy or ability in the management of all these institutions. What capital speeches are heard at their meetings! What excellent papers are read! Take them as reported week by week in the agricultural journals, and one is most favourably impressed by the knowledge and ability displayed; there is no better essay anywhere, not even in the pages of our annual volumes of Society Transactions, where everything is the result of laborious care and thought, that will excel the three speeches on that most important agricultural subject at this season of the year, and especially at this season of this year, the provision of winter food for stock, which are reported from the East Lothian Agricultural Society to-day, as having been spoken on the occasion of a recent meeting by three farmers of that county; and elsewhere in our pages the same truth is well illustrated this week. What a constant freshness, too, there seems to be in the proceedings of these societies; every year fresh lists of questions for discussion indicate the enormous extent of the agricultural field. The London Farmers' Club, although its surviving original members are now all grey-haired men, is still never at a loss for new subjects on which to direct its attention. Its last year's list is full of practical and scientific interest—grass-land management, sewage farming, land exhaustion, English Tenant-Right, local agricultural difficulties and successes, the principles by which the size of farms should be regulated, there is a touch here and there all over the field for agricultural discussion, and this year's list is just as good. If criticism were wanted anywhere it would, we think, apply rather to the topics on which the Chambers of Agriculture are engaged; they seem taken up with the tithe of mint and cummin, to the comparative neglect of the weightier matters of the law. All England of a certain class has been lately roused by them about the "average clause" in our fire insurance policies; a matter in theory insignificant, and in practice, seeing that agricultural insurances are at present barely profitable for the

companies, really altogether undeserving of attention, the whole thing affecting not more than a few farthings per acre. Or take the subject of weights and measures, and the introduction of the decimal system into agricultural dealings, of which a good deal is being made! And even the great question of the incidence of local rating which has of late almost monopolised the public efforts of so many distinguished men, acting through these Chambers, and of which we would not dispute the importance, is yet, with great diffidence be it spoken, not of such direct, immediate, or practical, influence or urgency as many another subject affecting the interest of the tenant-farmer, on which not a tithe of the attention is bestowed that it deserves. The miserable effects of game preservation to excess, the utter selfishness of *battues*, the need of better agricultural education, the necessity of absolute security for the tenant's capital: these do not excite nearly so much attention as topics of doubtful, or even fanciful importance. We may, indeed, almost take the three leading chairmen of our great institutions, Chambers, Clubs, Societies, as fairly representing their respective contributions to the work of agricultural progress; Lord Vernon interesting himself in agricultural education, in agricultural co-operation, in agricultural safety from imported dangers, and now in agricultural benevolence and philanthropy; Mr. James Howard, M.P., Chairman of the London Farmers' Club, bringing to bear an unusually wide acquaintance with the agriculture of other countries upon the improvement of the agriculture of his own, and now originating and directing the efforts of English agriculturists for the relief of those of France; and Colonel Tomline, M.P., Chairman of the Central Chamber of Agriculture, known to agriculturists and others chiefly by his whimsical dispute with the Master of the Mint! The Farmers' Clubs are, we believe, practically more useful than the Chambers. Touching the labourers through their ploughing matches, and other rivalries in technical skill, touching the landlords also, but dependent mainly on the mutual interest of the tenant-farmer class, which they deal with almost exclusively by the help of the farmers themselves, they are, we think, the more practical and better institution of the two.—*The Gardener's Chronicle*.

A CLERGYMAN TAMPERING WITH PARISH RETURNS.—The Rev. E. Smythies, rector of Hathern, was the defendant in an action in the Loughborough County Court, brought by Mr. Edward Lowe, a parishioner, for "making a false and malicious return, whereby plaintiff was prevented from filling the office of waywarden." Although the plaintiff laid the damages at £20, his pecuniary claim was nominal, his real object being to establish his right. The evidence showed that the defendant had tampered with the return of the voting for waywarden of the parish, and thereby deprived Mr. Lowe of that position to which he was fairly entitled. The jury found a verdict for plaintiff, but at the request of his solicitor the damages were reduced to one shilling.

PEAT, AND ITS PROFITABLE UTILISATION.

At the meeting of the Society of Arts, Mr. Robert Rawlinson in the chair, the following paper was read by Mr. ROBERT M. ALLOWAY, M.A.: The subject of the paper which I am permitted to offer to your notice this evening—the profitable utilisation of peat—is one which, about twenty years ago, attracted considerable interest, and became at that time a matter of speculation and inquiry in many places. If it had then had the good fortune to have fallen into more practical hands, it might not have remained up to this period so neglected as it is. Perhaps some gentlemen present may recollect that, about the year 1850, two members of the House of Commons brought forward there certain striking but rather extravagant statements of the supposed value that lay hid in peat; so great, indeed, that even 500 per cent. of profit was alleged to be not too much to be expected from its manufacture. Clever, but rather superficial letters, were about the same time published in the late Mr. Dickens's *Household Words*, and in *Chambers' Journal*, entitled "The Irish California," "The Devonshire Dorado," "The True Tom Tiddler's Land," "Peat Aggression," &c., which, being filled with flowery descriptions and too facile assertions of unascertained and unproved value, became soon suspected of being largely overdrawn, and caused peat and its utilisation to be looked on with indifference, if not with ridicule. When this was followed up by the establishment of two or three companies and the erection of large factories, which, being worked on false principles, were very soon abandoned, their failure was at once attributed to the impracticability of the peat itself, and not to the errors and mistakes of the projectors. This, of course, was unjust, and has placed much difficulty in my way, or that of anyone who may endeavour to treat it properly and profitably, as it is an arduous task to overcome a popular prejudice. Almost everyone is aware that large tracts of land in England and Scotland, besides immense portions of Ireland, are covered over with this despised but really singular and valuable substance. Peat has been admitted by geologists to be of a nature akin to coal—in fact, coal in its primary condition. Coal having once existed on the surface of the earth, and being then spongy and full of moisture, like peat (as the ferns, horsetails, &c., found imbedded in it proved) became buried hundreds of fathoms deep by the upheavings and subsidings of that period, and thus being subjected to great pressure, the soft material was consolidated by the superincumbent weight, as well as by the increased heat from the internal fires of the globe. Reflecting on this theory of the formation of the coal beds, it was not illogical for the first experimenters in peat to come to the too hasty conclusion that compression, joined with artificial drying (as if in imitation of nature) was the true method for treating it, in order to make it into an improved form, and which might be called peat-coal. One of the first to turn his talents and ample pecuniary resources to this matter was the father of the late Lord Willoughby d'Eresby. He invented a very powerful compressing machine, which he imagined would press all the water out of the peat, and leave it in a dry condition. His machine, however, was found in practice to press more of the moisture into the peat than out of it, and finally his plans were found to be quite erroneous, and his machinery useless. Notwithstanding his failure, several others followed him with more or less modification of his ideas, but all still working on the erroneous notion that compression was the only true method, nature herself (as was argued) pointing it out in the formation of the coal-beds. Nature, no doubt, is a grand guide in most matters, but need not be too slavishly followed, and above all must not be misunderstood. If nature is to be fully followed in this case, all the conditions of time and place which accompanied their formation should be present also, which, of course, is not the case, nor ever can be. Compression, therefore, by machinery upon the plans invented by Lord Willoughby d'Eresby, and carried on by all other experimenters in peat who followed him, up to the present day, having failed to produce anything really profitable or useful, a practical man will naturally turn his attention to something else, which I have endeavoured to do, and consider

that I have fully succeeded in effecting it. For the last twenty years I have taken an increasing interest in peat, being fully persuaded of its great importance, and the wealth, commercially and agriculturally, that lies hidden in it. I do not put an extravagant value on it, but may promise a fair and reasonable return for outlay, such as is generally looked for in similar undertakings. I had good facilities for experiment on a deep peat bog of my own in the Queen's County, and, having become acquainted with several of the gentlemen who were successively trying their own plans, on visiting their factories, I could not but become conscious of the cause of their failures, which I frequently suggested to them; but each and all were too strongly biassed by their own pre-conceived notions, and wedded to them, to alter their workings in any way to my views. My prophecies, however, were eventually proved true in all cases by the successive failures of all, and I thence came to the conclusion that, if a peat coal could not be made without expensive machinery and without artificial drying (thereby wasting other fuel), it could not be done to any profit or practical result. Something then drew my attention to the effects of air-drying, by simple atmospheric evaporation, making the sun and the wind act for me more effectually, rapidly, and economically in consolidating and drying the wet peat than ever had been done, or I am certain ever can be done, by any kind of machinery to compress with, and by hot flues, kilns, or blasts to dry with. I was aware that much might be effected by atmospheric evaporation, but was agreeably surprised to find it exceed my expectations. I then shortly brought my first ideas to a successful practical issue, the simplicity and rapidity as well as the economy of the process being very apparent, but yet only to be clearly understood on being seen at work. In consequence of the experiments and convictions above alluded to, I discarded, as impracticable and unprofitable, Lord Willoughby d'Eresby's hydraulic press, Cobbold's cylindrical churn, Glynn's steam rams, &c., with all kinds of hot-air blasts, heated tables, hot flues, kilns, &c., and simplified, step by step, an economical, common-sense, working plan, on plain, scientific principles, by which a dense, portable, wood-like (rather than coal-like) substance can be made at once from the soft, wet peat, consolidated without pressure, and dried in a few days (generally three or four) by atmospheric evaporation alone. In arriving at this desirable result, I always kept in mind the laws of capillary attraction and atmospheric evaporation, which govern so many matters of daily occurrence, small and great. My process consists of two plain principles, which I trust will not be despised for their simplicity, nor for their appearance of being only improvements on the old barbarous method of air-drying peat, which generally takes from three to four months. There is, in reality, almost nothing absolutely "new under the sun"; not even electricity, animal magnetism, or photography; but in all and each of those arts such improvements have been made in the first rude ideas or discoveries respecting them, that their present marvellous perfection has been accomplished by gradual improvements, and are acknowledged to be the same now as if they were absolutely new. It may be remarked that my process appears to be little more than the old hand-turf method improved, which of course I cannot altogether gainsay; but then if so the improvement is as great and as important, and carries as much difference as there exists between the amount of one to forty, or between three days, in point of drying, and three months. My manufacture of peat differs from the old method of making common hand turf, inasmuch as that the former is completed and dried in three days, the latter taking three months. One crop only of common turf can be raised from the same plot of ground in the season, whereas from thirty to forty crops of mine can be taken in the same period. By this I mean, that from say one acre of bog land but one single crop of common turf covering it all over can be raised and dried in the same year. Common "turf" or peat, in large sods, requires about three months to dry, and, consequently, there almost never occurs so fine a season as to allow of a second crop being properly saved. In

my process, the drying season lasts from five to six months, and as, on an average, two crops per week may be counted on, and there being more than twenty available weeks, between thirty and forty crops will be the return (which, in fact, has always been done at my model manufactory) from the same space of drying ground as could produce but one only of common turf. My peat-coal is as portable as pit-coal, whereas common turf is almost unportable, at least to any distance. In place of compressing machinery, with hot plates or flues, &c., for drying, I have enlisted the services of three grand natural wonder-workers, who do what I want without cost or payment—viz., in summer the sun and the wind, and in winter the rain. The rain lends great help to the mashing or pulping, which is my first process, and the sun and the wind dry my products in much less time than any artificial heat or wind machine ever did, and at a twentieth part of the cost. Thus, my first simple process is the mashing or breaking up the raw material. Peat, being sponge-like, requires to be disintegrated in order to destroy its cellular conformation. This, if not done, would leave it in its sponge-like condition, and prevent its proper consolidation. Those, therefore, who attempted to compress raw peat without first having mashed it, could not but fail, as it would continue always liable to reimbibe moisture, even if the compressing machinery had succeeded, which none ever did. As to the actual method of mashing that I employ, it is very simple, but very effective and economical. I constructed several machines myself for this purpose, all of which failed. I also attempted, ineffectually, to make use of existing machines, such as are employed for mortar, and for working up brick-clay, &c. The peat, from its peculiar nature, will not break up or mix readily in any of these. It is of a greasy and india-rubber like tenacity. Thus having failed to invent a mashing machine myself, or adapt any other known one, I struck out a simple mode of mashing by hand, the rapidity and effectiveness of which in pulping the raw peat must be seen to be fully appreciated. The peat-bank being opened in the way usual in common turf-cuttings, I place one man to dig it in large sods, which he throws over to six others who are opposite to him in line each armed with a wooden mallet, having a long handle. Each man strikes the sod thrown to him, and by a few blows completely mashes it up. The peat thus broken up is shovelled at once into an adjoining water-hole, from whence a similar bank of peat had been previously taken, and had become in consequence partly filled with water. There it remains melting into a thick pulp, until required for moulding. This mashed up peat absorbs all the water, and when the moulding commences in April, it is generally of about the proper consistency. It is then shovelled up on the adjoining bank by a man who stands on the pulp by the aid of large foot-boards, like snow-shoes. The man on the bank wheels it off in light, but peculiarly-constructed barrows, to the drying-tables, where he quickly discharges the wet peat on light boards like mortar-boards, from whence the moulders (women, girls, or boys) each take up as much of it as possible in their hands, give the portion so taken up two or three rapid slaps of the upper hand, and quickly place the "pat" on the table, each fresh "pat" just touching its neighbour. As the "pats" dry, which they do very rapidly, they shrink asunder, whereby the air passes more freely between them. This slap of the hand (particularly the soft hands of women and children) is the only method I have ever found effectual in driving the peat together, and putting it into a proper condition for having its moisture evaporated by the atmosphere, and its mashed up particles condensed by contraction. No machine has ever been produced to do this, nor in my opinion likely to be. Peat balls or bricks thrown from any kind of machine come out full of cracks, and tumble to pieces as they dry. My drying tables are constructed of a frame work of wood, each 36 feet long by four feet wide, and of a convenient height for the moulders to stand at, generally about 2 feet 6 inches. These tables are completely in the open air, and uncovered by any shed, which would only impede the drying. This framework is covered crosswise by common deal 4-feet plastering laths. I found that the dry, wooden lath absorbed the moisture and aided the drying better than wire-netting or any other material that I tried. These laths are nailed down to the framework at about half an inch asunder, so that the air can pass freely upwards or downwards. When the "pats" are dry, on the third or fourth day, one man or boy pushes them off the

tables very rapidly into a long wheel or hand barrow on the other side, by which they are conveyed into open lattice-work wooden sheds, which are built conveniently adjoining for storage, and very soon after are fit for sale and use. The moulding is carried on from about April to November. It is easy and healthful work. The peat is dried and the tables cleared generally on the fourth day after being moulded, and the peat-coal raked off and put in the store-houses, when the tables are immediately refilled with a fresh batch of wet "pats," and so on through the entire season, until the frosts and long nights come on at the end of October, when the moulding ceases, and the pulping for the next year's work commences. This healthful and profitable employment of young boys and girls, from ten to fifteen years of age, may be a matter pleasing and interesting to some; and if my peat process should be carried out on a large scale, it would prove to be an admirable industrial school, and afford excellent, healthy employment for children of that age, who generally are unequal to and unfit for the hard drudgery of common farm work or factory work, and for whom there is so little profitable, and at the same time wholesome work to do anywhere. The poor-houses, particularly in Ireland, are filled with sturdy but idle boys and girls, and I could suggest a plan by which the rates could be relieved from the cost of maintaining these poor little gaol-birds, and which would change them into different creatures in a short time. As to pit-coal, of course I do not mean to interfere in any way with its position in public estimation, nor to detract from its wonderful value and importance to England and the whole world, but I may say that the peat-coal which I offer to your notice might be preferred by many (if to be had in large quantities in the general market) as a domestic fuel, being much cleaner than pit-coal, and untainted by noxious gases, which are deleterious to health, and notoriously injurious to furniture, pictures, &c. The preliminary expenses required for establishing a full-sized working manufactory would not be a fiftieth (I may safely say) of those necessary for opening a coal pit, and also without future risks or chances to calculate or allow for. All here is open and visible work on the earth's surface. In fact, the first outlay on the tables, store-houses, &c., would be less than that required to stock a common farm, not to speak of mining or other expensive kinds of manufacture. The peat coal has been pronounced by competent authorities to be a first class fuel for generating steam. If it should ever become the general fuel of the large cities of England, then London, Edinburgh, and Dublin, &c., would, I am convinced, enjoy as pure atmospheres as Paris or Brussels. A great deal has been written and spoken about encouraging the industrial resources of Ireland. Here is one of the foremost and most peculiar of them, calling aloud to be utilised. Why may it not be? If my process be not what I state, let it go. But if, on strict investigation (which may be made and proven on the spot, where it can be seen at work), it shall be found not to be exaggerated in its value, I cannot understand why it should not be carried out, when millions are every day spent on matters that are comparatively unremunerative, and accompanied with risks and chances which frequently make losses the rule and profits the exception. My peat farming can also compare favourably with common tillage farming, or stock farming. The peat is not liable to be damaged by the thousand ills that land produce is heir to. It cannot be injured by blights, birds, vermin, or insects, like corn or green crops. It is proof against diseases and fluctuations in value, or accidents, like cattle, &c. Even the worst kind of wet summer weather will merely delay the drying for a day or two. The following outline of statistics may be at present sufficient to give a general idea of the process. I may promise that it is by the number of drying tables that my calculations are made as to the size of a manufactory. A full-sized one should consist of 10,000 tables, each 36 feet long by four feet wide, constructed simply of substantial wood frame-work. These 10,000 tables would turn off in the season (say from March or April to November) about 50,000 tons of peat coal (about five tons per annum on average being made from each table). This, if sold at only 10s. per ton (a very low rate) would give a profit of 20 per cent. This full-sized manufactory would cost in outlay on plant as near as possible £10,000, a comparative moderate sum, and would require about 100 acres of deep peat bog, which would contain sufficient raw material for forty to

fifty years' work. A brisk wind and unimpeded sunshine are nowhere to be found in greater perfection than on a large open bog, where almost every day in the year there is more or less breeze and motion of the air, which in my process is better than dull sunshine. Both sunshine and breeze together are of course perfection, and perform wonders in the way of drying the "pats." To sum up, the peculiar advantages of my process are—That the peat-coal can be made so inexpensively as to afford a certain and unremunerative profit in three or four days, and is capable of being sent anywhere over the world in bags like coal; that it is cleaner and freer from smuts and sulphurous smoke than coal; that 30 to 40 crops of it can be taken where only one crop of common turf can be produced in the same season; that it is cheaper, more portable, and better every way than common turf, and can compete with pit-coal anywhere but at the pits' mouth, or in places in close proximity to coal districts. In addition to the above, it will afford opportunity for that long-sought object, the profitable utilisation of the vast peat wastes of these countries, particularly in Ireland, where there are three millions of acres covered by peat, while it would afford remunerative and yet healthful employment for men, women, and above all, children, with handsome profits to the employer and capitalist. The moulders get so dexterous in a few days that they can earn much better wages, with less toil, difficulty, or hard work than they could at any other kind of farming employment. I may fairly call this a species of farm-work, to which it is much more similar than to any kind of factory work, as the term is generally understood. The feasibility of rapid hand-moulding was first suggested to my observation on seeing the boys at Woolwich Arsenal making copper caps for the army. A few years ago they were made there in large quantities altogether by hand-work, and it was surprising and interesting to remark the quickness and facility with which such small articles passed through the manipulation of those smart little boys. My peat "pats," being much larger, and not requiring such dexterity of finger, are consequently much easier to be formed into the proper shape and size. Most people would be well pleased at seeing the young girls and boys whom I have trained, healthfully and lightly employed at the moulding. The whole process being done by task or piece-work, the cost of labour can be ascertained to a fraction almost, while the expenses in any method hitherto attempted by machinery have been quite undefined, and a certain mystery attached to them, besides requiring more hands to attend to them than I require without machinery, in making an equal quantity of fuel. The first and only expenditure necessary is for putting up the drying apparatus—viz., the tables and the lattice-work wooden store sheds. The cost of erecting those may be calculated by the number of tables, at, as nearly as possible, 20s. for every table, which includes the cost of erecting the required number of shed for storing the peat-coal in, according as it becomes dry on the tables, every three or four days. Thus, £10,000 would be ample capital for the establishment of a full-sized manufactory, consisting of 10,000 tables, with all necessary adjuncts of sheds, implements, short roads, &c. These 10,000 tables would produce about 50,000 tons of peat-coal in each season. The money at first expended in labour would be available again in some places in a month or two, and could thus be turned over three or four times in the year, carrying, of course, each time a profit of at least 20 per cent. In localities where pit-coal is scarce and dear, the selling price at the works might be fairly increased to 12s. or 14s. per ton, which would add very considerably to the profit. The tables and store-sheds and store-houses, when once substantially erected, would last for many years (perhaps thirty to forty, or longer) with a mere trifle for occasional repairs to the laths and woodwork, on which there would be but little "wear-and-tear." The peat-coal is so condensed, and thereby so reduced in bulk that one cart or dray can carry as much value of fuel in it as ten similar conveyances could of common turf. The same proportion holds in carriage by railway, canal, or long sea, as well as in storage. It will also not occupy more space than coal in transit; a railway truck that conveys five tons of coal will also carry five tons of the peat coal. Railway companies generally decline to carry common "turf," or at least put a prohibitory freight upon it. I found the freight on peat to be 12s. per ton between Portarlinton Station (Queen's County) and Dublin, only about 40 statute miles. On remonstrating

with the board of directors of the Irish Great Southern and Western Railway on this point, and sending them a few bags of my peat-coal as a sample to their board-room, they were so pleased with its appearance, portability, and cleanliness, that they voluntarily agreed to carry it to Dublin for 8d. per ton less than pit-coal. If it were largely manufactured, I have no doubt but that all other railway companies would do the same, or make the freight even less, and give liberal encouragement to a product of such universal consumption. I have in my possession a considerable number of testimonials as to its value. I will, with your permission, read two or three of the shortest of these, and hope I am not abusing your patience; but I wish to allude to this matter in every possible point, and explain its difficulties and the way to overcome them. The first and shortest is from a gentleman of high position, the Chief Superintendent of the Government Valuation Office in Ireland. He writes: "I consider Mr. Alloway's peat excellent, and better than any other I have yet tried." Another is from one of our Irish judges, formerly well known in Parliament, which runs thus: "Thanks for the peat, which I have received and tried. It burns clearly, steadily, and slowly, without waste, and, as far as I can judge, leaves no unpleasant deposit of ashes or otherwise. I hope it will turn out a profitable speculation, not only on your account, but in the interests of the country." The third and last that I shall trouble you with is from Mr. David M'Dowall, the proprietor of large saw-mills and corn-mills, worked by powerful steam-engines, in Dublin. He first gives his opinion of it as a domestic fuel, and then as a steam generator, viz.:

"Patent Saw and Corn Mills, Montgomery-street, Dublin.

"Your peat fuel is first-class for house purposes. I divided what you sent me amongst a few friends, and all are loud in their praise of it. I cannot give an opinion about it for steam yet, but I would like to get five tons of it for that purpose. If you succeed, and which I have no doubt you will, it will be a great boon for Ireland. "DAVID M'DOWALL."

I then sent him a larger lot, and received the following:

"I have used a good deal of your peat fuel in my house, and we prefer it before the best house coal. I have also tried it for steam purposes recently, and although my boilers are not so suitable for it—being made purposely for burning saw-dust—I am persuaded that where tubular boilers are used, either on land or sea, it would be much preferable to either coke or coal, and would be found a first-class fuel for generating steam. I cannot but wish you every success with your invention (decidedly a good one), and I will most heartily join in a company to carry it out.

"I am, dear sir, faithfully yours,
"DAVID M'DOWALL."

"P.S.—All engineers know very well that tubular boilers require less flame than cylindrical ones, but the more extreme heat the better. Hence the use of coke; it is the very thing your peat is adapted for. "D. M'D."

As to the *minutiae* of the cost of manufacture, in case any gentleman present might wish to know it, I will add the following particular items of the manipulation as close as I can here:

<i>Cost of Handwork.</i>	Per ton.
	s. d.
Mashing	0 9
Moulding (at the rate of 10 tables to make a ton, at 3d. per table)	2 6
Turning the "pats" on the tables	0 6
Baking-off and carrying to store-sheds	0 3
Filling up bags, carting from store-sheds to the main store-houses adjoining the bog	1 0
Total, 5s. per ton for manipulation	5 0
Leaving 3s. per ton to answer for incidental expenses of agency, superintendence, &c., as well as interest on money expended on plant, which will be found more than sufficient	3 0
Total cost per ton	8 0

It has been remarked to me that if my process be the good and profitable one that I state it to be, why has it not been

taken up as largely as is required in Ireland? I am sorry to say I cannot answer that question further than that Ireland has been the locality where two remarkable peat establishments were erected not long since, which, being attempted on wrong principles and extravagant outlay, failed, and whose failure has disgusted the public so much that it is both blind and deaf to any further experiments in peat. But this blindness and deafness to a simple and economic process like mine cannot, I suppose, last for ever. Another friend of mine has told me

that my process is quite unknown, and that I have not advertised it enough. That is quite true, for I wished to wait until I had properly satisfied myself that I could satisfy others. Having done this, and having now brought it before the notice of the Society of Arts, it cannot at least any longer remain unknown. I exhibit a bag full of the "pats," taken from one of the store-houses, where I have about fifty tons kept for sample. They are, as may be seen, more like hard wood than coal, and suffer no waste whatever in carriage.

THE FRENCH PEASANT FARMERS' SEED FUND.

The first meeting of the general committee, nominated at the public meeting on the 19th of December, was held at the Salisbury Hotel, Salisbury-square, on Thursday, January 5, Lord Vernon in the chair, when it was reported on behalf of the hon. Secretaries that circulars had been sent to the various Agricultural Societies, requesting them to take the necessary steps for the formation of local committees, and that the offer of Mr. Odams to place his wharf at the Victoria Docks at the disposal of the association had been accepted. These acts of the secretaries having been formally approved of, on the motion of Mr. J. Caird, seconded by Mr. J. Howard, M.P., Lord Vernon was unanimously voted to the chair of the executive committee.

In acknowledgment of the honour conferred on him, his Lordship said that the position not only of the chairman, but of every member of the committee, would be a very responsible one, inasmuch as the duties devolving upon them would require to be performed with great delicacy. They would be entrusted, no doubt, with an amount of money which would probably be very large; though possibly it might be small. If it were large they might have difficulty in its distribution on that score, whilst if it were small they might have difficulty in exercising a proper discrimination in sending it to those districts in France which most wanted assistance. Under any circumstances they would have to be very careful indeed, that the money was actually applied to those who had been placed before the public as requiring their help. It would be important, then, that they should be able to show the public that the grain sent to France, whether subscribed directly by the farmers or purchased with money, was really used for the sowing of the land. He was well aware that when a hostile force was in possession of any large portion of a country, as was the case with the German army in France at this moment, there might be considerable difficulty in forwarding grain to the spots that it was desirable to relieve; but that and similar points were matters of detail, and he was persuaded, if they approached their task with energy and a proper feeling of the responsibilities to which he referred, that they would be successful; that they would inspire the agricultural body in this country with such confidence that the necessary funds would be subscribed, and that they would be able to distribute them in many parts of France, if not in all, that they desired to assist. He might add that he had been induced to fill the post of Chairman mainly because Mr. James Howard, who, he was glad to see, was so far recovered from his recent illness as to be present that day, had expressed a desire that he (Lord Vernon) should act as their Chairman; and because he felt confident that that hon. gentleman, even if he found himself prevented from attending their meetings as closely as he could wish, would give them the benefit of his counsel and advice (Hear, hear).

The following gentlemen, being members of the general committee, were then appointed an executive committee: Lord Vernon, Mr. J. Howard, M.P., Mr. C. S. Read, M.P., Mr. James Caird, C.B., Mr. J. C. Morton, Mr. Owen Wallis, Mr. R. Leeds, Mr. Aveling, Mr. H. Corbet, Mr. Odams, and the three Honorary Secretaries; their functions being the collection of donations and the obtaining of information with regard to the French requirements; the general committee to be summoned previous to the commencement of any distribution of seed.

The following letter from M. Drouyn de Lhuys was read:

Société des Agriculteurs de France Présidence.

St. Heliers, Jersey, 26th December, 1870.

Monsieur le Président,—It is a matter of much regret to me

that I could not be present at the meeting held at the Salisbury Hotel on the 19th of this month. I have just read with keen interest the report in the newspapers, and it is my heartfelt desire to express to you the sincere gratitude with which the generous resolutions carried at that meeting have inspired me. The impulse having been given, I feel convinced that the movement will not be arrested until the object has been attained; the well-known perseverance of your nation being a sufficient guarantee. The English farmer does not abandon his plough in the middle of the furrow.

In order to carry out the project in question, two points must be considered. 1st. The appeal for donations in money and in kind, their collection, a bank to receive the money, and warehouses to store the seed. Measures of this nature have already been partially taken, and will eventually be fully carried out in the three kingdoms by the efficacious initiative of your committee, assisted by the unanimous and friendly co-operation of the press of Great Britain. 2nd. The organisation in France of committees charged to report the special needs of those localities ravaged by the war, and to prepare the basis of an equitable distribution amongst individuals. It would seem that the most practical combination would be to constitute in each commune a committee composed of the mayor, or his delegate of the vicar and the schoolmaster. This committee should make out a statement, showing the quantity and kind of seed and other requirements necessary for preparing and sowing the land. To this statement should be subjoined the list of names of those peasant farmers applying for aid, with the extent of their holdings and the needs of each of them. This statement, properly certified, should be sent to a committee formed in the chief town of the district, and composed of the mayor, the justice of the Peace, the senior attorney (town clerk), the magistrates of Quarter Sessions, and 3 members of the Société des Agriculteurs de France, or of the local agricultural society. This committee would be charged with collating the statements from the communal committee, and with certifying and settling the definitive plan of distribution, which plan should be sent as early as possible to the London committee. The English Consuls and the delegates of the English committee should take part in the deliberations of the communal committees and of the district committees as often as they might consider it desirable. The district committees, by the intermediary of the respective mayors, would deliver to each peasant farmer, whose application should have been registered, a draft signed by the president of the committee, and indicating, together with the name and address of the applicant, the quantities and the materials to be handed over to him. It remains to be determined the places where the objects (seed) should be deposited, and where the drafts should be presented to obtain delivery. This point will have to be arranged by a common understanding, taking due note of the position of hostile troops, the state of the roads, means of transport, &c., &c., &c. Such, Monsieur le Président, are the observations which I have forwarded to France by last post, reserving full power to make such changes as the London committee might consider necessary. I beg you to receive, Monsieur le Président, the assurance of my distinguished consideration, and of my sentiments of devotion.

(Signed) DROUYN DE LHUYS,

President of the Société des Agriculteurs de France,
and Honorary Member of the Royal Agricultural
Society of England.

It was further agreed, on the motion of Mr. Aveling, seconded by Mr. J. Howard, that special meetings of the

general committee should be convened on the requisition of any three members of the executive committee.

The President was requested, by resolution, to communicate with the ambassadors of France and the North German Confederation, with a view of ascertaining what assistance can be given by their respective Governments to ensure that the seeds sent to the distressed peasant farmers shall be used only for sowing the land.

Mr. ALBRIGHT stated that the German governor of Lorraine had intimated to the Society of Friends his willingness to render every facility for the distribution of the seed within the territory under his jurisdiction, so that there would be no danger of its being appropriated as food by the Germans.

Mr. HOWARD suggested that any such misfortune as that might be averted by steeping the grain in a chemical solution, so making it unfit for food, and labelling it "poison."

The Secretaries were subsequently instructed to communicate with the railway and canal companies, with a view of obtaining free conveyance of donations to the French Peasant Farmers' Seed Fund; also to issue circulars specifying the kinds of seed most likely to be useful.

Several names were added to the general committee, and it was resolved that the members of both Houses of Parliament, the chairman, and secretaries of the various agricultural associations, the Council of the Royal Agricultural Society, the Smithfield Club, the Yorkshire Agricultural Society, the Bath and West of England Agricultural Society, the Chamber of Agriculture, and the Committee of the London Farmers' Club should be invited to become members of the general committee.

Thanks were voted to Mr. Odams for his offer of wharfage accommodation; and it was announced that the London and County Bank had consented to act as bankers, and that since the public meeting in December the list of subscriptions had been increased by the sum of £435 10s., making the total £1,370 13s. Additional subscriptions amounting to nearly £40 were also handed in, and some liberal contributions "in kind" promised, including a load (40 bushels) of seed corn by the Earl of Chichester.

The proceedings closed with a vote of thanks to the chairman.

RELIEF FOR FRENCH FARMERS AND PEASANTS.

On Saturday, Jan. 7, a meeting of the East Kent Chamber of Agriculture took place in the Town Hall, Canterbury, to consider what steps should be taken with the view of organizing a fund, and (so soon as peace is declared) of receiving contributions, either in money or seed-corn, for the relief of the French farmers and peasants whose lands have been devastated during the war. The hon. G. W. Milles, M.P., was in the chair.

The CHAIRMAN, in stating the object of the meeting, mentioned that, in supporting the movement for which they had assembled, it should clearly be understood that they were not declaring themselves in favour of one country or the other, their only object being to alleviate if possible the distress which must result to the agricultural community in those districts where war had been raging.

Mr. JAMES LAKE proposed that a subscription-list be opened, and the money subscribed forwarded to the Central Committee.

Mr. AVELING (Rochester), in seconding the resolution, stated to the meeting the operations of the Central Committee.

Lord FITZWALTER pointed out that if the Central Committee distributed money and corn during the continuance of the war, there would be several difficulties to meet. He was afraid that if the money and corn given were distributed while the war existed, it would be almost waste, because the good done would be undone by the effects of the war.

Lord HARRIS said there was an important question to be considered in reference to distributing the subscriptions during the existence of the war. It was exceedingly doubtful whether, considering the strict neutrality we had adopted—and this was the only right course we could have taken—we could supply one country with seed while the war lasts. If it could be done without interfering with our line of policy let it

be done; but it was a question that required some serious consideration.

Mr. AVELING said their lordships might rest assured that the Central Committee would give the subject alluded to its most serious consideration.

After some discussion as to whether subscriptions in kind or money should be given, the following resolution was agreed to unanimously: "That this Chamber organise a fund to be collected forthwith, and that as soon as peace is declared such money be handed over to the Central Committee for the relief of those French farmers and peasants whose lands have been devastated by the war."

Those present at the meeting quickly promised subscriptions in money amounting to £200, and there were likewise many promises made of seed corn.

The money and kind will be handed over to the Central Committee Fund at the close of the war.

THE ESSEX CHAMBER OF AGRICULTURE.—

The annual meeting was held at Chelmsford; Colonel Brise, M.P., the president, in the chair. The Secretary read the report, from which we take the following: We are pleased to be able to congratulate the members of this Chamber on its being one of the largest and best supported Chambers in the kingdom, there being now on the books upwards of 700 members; but the Council regret that they have again to call attention to the subject of unpaid subscriptions, which occasions great inconvenience in making out the financial statement, and also inflicts great additional labour on the secretary; but they feel that they have only to bring this subject to the notice of those who have not already paid the very trifling, and in fact merely nominal annual subscription of 5s., to ensure it being sent at once to the secretary. It will be a fair subject for consideration at this annual meeting whether the present mode of collecting the subscriptions does not admit of improvement. Mr. A. Johnston, M.P., was elected president for the ensuing year, and Mr. J. Round, M.P., vice-chairman; after which votes of thanks were passed to Colonel Brise, M.P., for his able and efficient presidency during the past year, as also to the secretary and other officers. The next meeting of the Chamber was fixed to take place at Colchester in the middle of February.

THE ESSEX AGRICULTURAL SOCIETY.—At the annual general meeting, Mr. J. O. Parker in the chair, a letter was read from Mr. Manfred Biddell, of Playford, Suffolk, enclosing a cheque for his subscription to the Society for the year 1869-70, and '71 in advance, and stating that it would be the last he should send till the Society opened its prize lists to All England. He was an owner of land in Essex, but could no longer see the fun of paying for prizes to those who are fortunate enough to own more than he did. The Suffolk Society was heartily glad to pay any Essex exhibitors any prizes they could win at the Suffolk shows, and in the Shorthorn classes they won nearly all the prizes, and as long as they sent better animals than the Suffolk breeders, those latter breeders had pleasure in thanking them and paying them all they could win. Mr. McIntosh, who was elected president, said he did not know that he should be out of place in stating thus early that he intended offering a prize to be competed for at the Romford Show. It would most probably take the shape of a challenge cup or some prize of that description. He should like to consult his friends the Shorthorn breeders upon the subject. As they were aware his yearling heifer gained the first prize at the Saffron Walden Show as well as at Oxford. He sold it for 500 guineas, and for a bull calf he had obtained 600 gs. He thought he might be satisfied by taking for himself the 1,000 gs., and would offer the remaining 100 gs. as a special prize. In the report of the committee was the following: Your committee was induced this year, by the urgent desire of some of its members, to make the experiment of holding a public auction for the sale of animals duly entered for the show. The sale was ably conducted by Mr. W. Rand, of Saffron Walden. The committee is of opinion, however, that the results will not justify its continuance, but will tend rather to lower the character of the annual exhibition, and to divert public attention from the main object the Society has in view.

CARR'S ANNUAL HARVEST REPORT.

ROSTOCK, 17th DECEMBER, 1870.—We herewith most respectfully hand you our Annual Harvest Report. The contents form a summary of reliable information, for which we are thankfully indebted to our numerous kind and trustworthy correspondents. We have added our N.B.'s as usual, from which you may draw your own conclusions as to the PRESENT and PROBABLE FUTURE course of the trade. As to the PAST, we can only refer to our remarks on the probable future state of the trade in our last Annual Report.

PRESENT.—Trade steady but quiet, with an inclination upwards, so that it must be concluded that it is in a sound position; the more so, as at this period of the season it habitually is one of dulness more or less, and considering that millers and bakers hold fair stocks, and that consumption is interfered with by large supplies of cheap and good potatoes. But prices are not high, and no doubt this fact, and the fact that rates in the Mediterranean and Belgian ports are higher than those paying in the U.K., backed by frosty weather, which not only increases consumption, but also strengthens the nerves of holders by leading them to expect, and naturally so, that when the anticipated large arrivals (598 cargoes, against 454 cargoes same time last year) actually get in, which must ere long be the case, they will for some time to come fall off. It is true that from New York, San Francisco, Chili, also from Odessa and the Danubian Principalities, important shipments were still in progress, but as the canals in the United States are now closed, and as the winter has set in in Southern Russia, the shipments will now cease, and the quantity shipping and on passage will only fill up the gap owing to the falling off in the arrivals in November, which amounted to nearly 400,000 qrs., without taking into consideration the quantity exported from the U.K., and that no doubt a very considerable quantity expected to arrive in Great Britain will be detained at the various Mediterranean ports, particularly at Marseilles. Further, it cannot be doubted but that the British farmers have sold more of their produce than usual at this period of the year; first of all they began to supply the markets some weeks earlier, particularly with wheat and barley, the larger ones for the sake of straw, and the smaller ones in order to raise the needful to meet current outlays and to buy forage; hay and turnips being scarce and dear, particularly the former. The above "pros" and "cons" are no doubt the chief cause of the present healthy state of the trade.

THE PROBABLE FUTURE.—What we have above stated applies more or less thereto. On referring to our N.B.'s under the various countries, you will find that Great Britain and Ireland require foreign aid to the extent of eleven million qrs. wheat and flour to carry the U.K. through from the 1st September, 1870, until the 1st September, 1871; or thirteen million qrs., to leave a similar computed stock of wheat and flour in store on the 1st September, 1871, and, provided always that the harvest of 1871 takes place at the same time as in average seasons. It will also be found that France will require an importation of four million qrs. wheat and flour; that the Mediterranean districts, and also Belgium, Holland, and Switzerland require aid to a greater extent than last year. Further, it will be seen that the British Lion's providers will be North America and Chili, which we have put down as being able to spare four million qrs. wheat and flour;

Russia, two-and-a-half million qrs.; Germany, one-and-a-half million qrs., including what may be exported via Stettin, from Hungary and Galicia; Austria and her provinces, excluding what may be sent via Stettin, Turkish dominions, and Danubian Principalities, half-a-million qrs. wheat; Egypt, quarter of a million qrs. Wheat; and Denmark, one hundred and twenty-one thousand qrs. wheat—total, 10,121,000 qrs. wheat and flour, leaving in round numbers one million qrs. to be made up by economy, or the use of other substitutes, and provided always that Great Britain and Ireland get the quantity above estimated, which there is every probability may not be the case when one takes into consideration the extended wants of the various countries above stated. At all events, where there is competition, prices generally do not rule low, and at present they are not high, there being scope for a considerable rise as the season advances, and the rise will be facilitated and the more aggravated, should England get mixed up in a war with either Russia or America, or perhaps with both, which is to be hoped will not be the case; the more so as the Turkish Government are for peace, and wisely so. The Alabama question may also be diplomatically arranged to the satisfaction of all, though at present the political horizon is far from satisfactory, and not in favour of low prices. It is further to be feared, that when the French-German war is at an end, civil war in France will be the order of the day. The short crop of hay and turnips, and the facts of feeding stuffs being dear and scarce, the short stocks of rice, high freights, and scarcity of ships and railway waggons; further, the cattle disease all over Germany, are all auxiliaries to keep prices up in those countries wanting foreign aid.

THOMAS CARR AND CO.

ENGLAND.—The breadth of land sown with wheat, in autumn, 1869, was less by 195,226 acres than in 1868; the seed was well got in; the winter was severe and protracted, particularly in February and March, the temperature was killing, which thinned out many of the wheat plants on the light, gravelly, and chalky lands, the good medium soils also suffering. Owing to the cold, dry spring, and the lateness of the season, little spring wheat was sown, consequently, a larger breadth of barley. Up to the end of April the crops were very backward, and had a very patchy appearance, and, had it not been for the fine summer (it being unprecedentedly dry—the drought set in earlier than in 1868) and very favourable weather for blooming time and housing of the crops, they would have been very unsatisfactory. Wheat and barley suffered somewhat in June from wireworm and slugs, particularly in the wolds of Lincolnshire, Gloucestershire, Buckinghamshire, Essex, and the adjoining counties. The heavy soils in the northern and middling counties withstood the drought better than those of the southern districts. One of our London correspondents writes: The old proverb that a drought and a dearth never come together in this country was put to the test and verified this year. The yield per acre varies greatly, namely from 4 to 6 qrs. on the heavy, and 2 to 4 qrs. on the light gravelly lands, say one fourth of the soil sown yields over an average, two-fourths an average, and one-fourth half a crop, ergo about 10 per cent. below an average yield in quantity, of fine quality, excellent condition, and about 2lb. per bushel above an average weight. Barley, larger breadth sown (say 117,146 acres more than last year), but suffered from a droughty and cold season, therefore the yield is sadly deficient (say of the quantity sown one-third yields a full average, one-third about an average, and one-third under an average, on the aggregate about 20 per cent. under an average yield per acre), quality various, much being flinty and coarse, but in the whole its malting properties

are not much complained of. Oats, rather less (say 22,013 acres) sown than last year, and yield about 15 per cent. under an average per acre; quality indifferent; condition and colour not over satisfactory. Peas, about an average yield, condition looks fine, but they do not boil altogether up to the mark. Beans, about 30 per cent. below an average yield, quality and condition good. Potatoes, good yield, fine quality, and very cheap. Turnips, very deficient yield, having suffered from drought and flies. Hay crop, one-half to two-thirds of an average.

WALES.—Wheat, less land sown, yield various, good on heavy, but very short on some of the light soils; yet, on the whole, the yield is slightly over an average per acre, it being in some fields 15, and in others up to 60 bushels; quality and condition fine. Barley, oats, and beans under average, these cereals having suffered much from drought. Potatoes have yielded abundantly, and are very good in quality, and almost free from disease. Hay up to half a crop.

SCOTLAND.—Rather more land sown in autumn with wheat under good auspices, the winter being severe and protracted, thinned, to some extent, the plant, which in early spring suffered through the ravages of the maggot and white grub, and thus a great number of acres were ploughed up, and re-sown with barley, therefore the quantity of land under wheat was considerably under an average; the yield per acre is an average, quality and condition good, average weight 62 to 63lb. Rye has been sown to a greater extent than ever it was before, and gives a large bulk of good sound quality. Barley, best crop of the season, being a full yield, excellent quality and condition, average weight 55 to 56lb. per bushel. Oats, about an average in northern and southern counties; quality and condition fine in the northern, but in the southern counties suffered somewhat from rain; average weight 40 to 45lb. Peas, nearly an average quantity, quality good. Beans, very deficient yield, quality good. Potatoes, good crop, quality fine. Turnips, poor crop, suffered from drought. Hay, good crop.

IRELAND.—Wheat, 19,546 acres less land sown in good order, got tolerably well through the winter, but in fact (say about one-third) not being secured ere the rainy weather set in, suffered somewhat in condition and weight, which varies from 54 to 63lb., mildew is also here and there prevalent, the yield on the whole one-fourth below an average. Barley, an increased breadth of land sown by 19,249 acres, yield full average, good quality, average weight 54lb. Oats, 36,476 acres less land sown, yield per acre 25 per cent. below average, quality very good, weight 40lb. Bere and Rye, 581 acres more sown, crop tolerably satisfactory. Beans and peas 760 acres more sown, crop satisfactory. Turnips, 16,987 acres more planted, crop 25 per cent. below an average. Potatoes 1,886 acres more planted, one of the largest and freest from disease for many, many years past, this will greatly lessen the demand for wheat. Hay, a good crop.

N.B.—It is a singular coincidence, that just the staple cereals grown and consumed in the three parts of the U. K. should have turned out best; for instance, England's best crop is wheat, Scotland's barley, and Ireland's oats and potatoes. As to the general yield of the United Kingdom of Great Britain and Ireland, taking the 5 per cent. short breadth of land sown, and the 10 per cent. short yield per acre, total 15 per cent., against which put the excellent quality, condition, and weight per imperial bushel, which we consider equal to 1,000,000 qrs., and putting down the average produce of the United Kingdom according to Mr. McCulloch's calculation, at 18,000,000 qrs., makes the yield of 1870 16,000,000 qrs., from which, deduct the quantity required yearly for seed, which Mr. McCulloch puts down at one-sixth the produce, or 3,000,000 qrs. leaves 13,000,000 qrs., add to which the probable stock of old wheat and flour in the hands of the farmers and trade in general on the 1st of September, say, equal to 2,000,000 qrs., leaves 15,000,000 qrs. to meet the consumption for the 12 months, ending 31st August, 1871, which we estimate to be in average seasons at 25,500,000 qrs. wheat and flour. But this campaign, owing to the shortness of the crops of other cereals, and the dearth of animal food, we think we will not be very far wrong when we estimate the probable consumption this campaign at, in round numbers, 26,000,000 qrs. Wheat and flour, according to which the United Kingdom will require an importation of fully 11,000,000 qrs. of wheat and flour, to make both ends meet, or 13,000,000 qrs. to leave the same quantity in store on the 31st of August, 1871 as was held on the 31st of August, 1870. Last campaign there has been imported in the United Kingdom 37,285,200 cwt. or 8,331,985 qrs. of 500lbs. wheat, and 5,631,975 cwt. flour, or at 3½ cwt. flour, equal to 1 qr., equal to 1,611,133

qrs., total 9,943,018 qrs. wheat and flour; ergo there are 1,000,000 qrs. less than we calculate will be required this campaign. The question now is, whether the exporting countries will be able to supply the same amount of wheat and flour to the United Kingdom, having more customers to serve this time, and to a considerably greater extent than last year, and whether the said exporting countries may not require more money under the circumstances; for the probable solution of this we refer to our N.B., where we comment on the result of the crops in the various importing and exporting countries.

FRANCE.—The same breadth of land sown in autumn, 1869 as in 1868, under favourable auspices; the winter was long and severe, and spring sowing was done under tolerably favourable auspices, the crops suffered from night-frosts at the end of April and early in May, particularly rye, barley, oats, and seed. Wheat suffered least, except the white grades, and on light soils it had a patchy appearance. The summer has been remarkable for its drought and heat, which did a great deal of harm to the spring-sown grain—hay and grass were literally burnt up! Blooming time went off well, particularly in the Southern and Central Departments. Wheat is the best crop of the season, hay and grass the worst. The quality, condition, and weight of the grain, with few exceptions (of which oats form one), is very satisfactory, colour might be better, wheat, in particular, being dark, somewhat flinty, and a slight admixture of sprout may be found here and there in the parcels gathered just at the close of harvest, when rainy weather was prevalent more or less; as to the quantity grown, the Southern Department have been best favoured, the yield of wheat may be called nearly a good average. Barley and oats, very little grown in these districts, in the Northern and North-western the yield is not good, having suffered from drought and rain; in the North-eastern, whatever may have been the yield, there is nothing left of either cereals or cattle, the peasant being destitute of even the required quantity for seed, ergo the prospects for the inhabitants of these Departments for the years 1870, 1871, and even 1872 are very gloomy; a similar state of things exists in the Eastern and South-eastern Departments. The South-western have been more fortunate, the yield of wheat and rye being only a trifle under an average, oats a poor, and barley a middling yield. Potatoes are a very moderate yield, and diseased more or less, particularly in the Eastern and South-eastern Departments.

N.B.—According to official accounts the wheat crop is equal to 34,000,000 qrs., against 41,000,000 qrs. in 1869. The following is a very interesting account of the yield in the various Departments of France, taken in full from the yearly report of the crops, issued by M. Estienne, in Marseille: Very good yield. 1 Department (above Pyrenees), with 69,461 hect. soil; good, 22 Departments, with 3,839,555 hect.; tolerably good, 14 Departments, with 2,772,700 hect.; moderate, 20 Departments, with 3,561,561 hect. (without the Department Maas); middling, 24 Departments, with 3,841,339 hect.; bad, 8 Departments, with 1,172,439 hect. The several cereals give the following results—Rye: very good, 1 Department; good, 22; tolerably good, 14; moderate, 20; middling, 25; bad 7. Wheat: very good, 4; good 13; tolerably good, 33; moderate, 3; bad, 3. Barley: very good, 6; good, 7; tolerably good, 2; moderate, 29; bad, 39. Oats: Good, 2; middling, 29; bad, 57. The total yield is estimated four-tenths of an excellent, four-sevenths of a tolerably good one.

In our opinion, had it not been for the wilful destruction of all kinds of cereals in the Departments above alluded to, caused by the war, the yield of wheat would not have been so very bad; but, as it is, the yield is decidedly below an average; this, coupled with the short yield of all other kinds of grain and fodder—and to add to the gloom the cattle disease has broken out in addition to that of the potatoes—will oblige France to import at least 10 to 15 per cent. of what she consumes per year (which in average peaceful seasons we put down at 96,000,000 hect., and 15,000,000 hect. for seed), par to 4,000,000 to 5,000,000 qrs. of foreign wheat and flour; and we fancy that, owing to the want of hands, seed, &c., the crop of 1871 will turn out, even under good auspices (the sowing having been tolerably well proceeded with in the unoccupied Departments, but this may be greatly lessened and destroyed by the ravages of war) much more deficient than that of 1870, ergo, for at least two years to come, will compete with the U.K., and other importing countries to the above extent. Such is the scarcity of potatoes in the French Departments occupied by the German forces, that the King of Prussia has ordered that the freight on potatoes on the State railways is to be only 1 pfennig (12 pfennigs equal 18gr., and 108gr. equal 1s. English) per German mile (or four-and-a-half English miles) per cwt., and recommended the private railway companies to follow the said humane example.

HOLLAND.—Usual breadth of land sown in autumn under good auspices, though a little later than usual, got well through the winter, rapeseed excepted, of which much was re-ploughed and sown with spring corn, chiefly oats. Quality of all cereals suffered more or less, as two-thirds were out when the heavy rain set in, which affected the condition, colour, and weight. The northern provinces continue cultivating more and more fax. Wheat about seven-eighths of an average in yield, deficient in quality, being coarse, and various in weight and condition. Rye, 95 per cent. of an average. Barley, oats, and potatoes average crop, latter one-third diseased. Buckwheat under an average.

N.B.—Holland will this year import about the same [as last year, say \$90,000 qrs. wheat.

BELGIUM.—Usual breadth of land sown in autumn, got well through the winter; the spring was cold and dry, and summer droughty, which did harm to the crops, these also suffered from rain during harvest time; in the western and coast districts, the harvest has been best favoured, the eastern districts not so good. Wheat, rye, and peas full average. Barley, not an average in quantity and quality, having suffered from heat and drought. Wheat, variable in quality, the greatest portion being damp. Rye is of fine quality, though here and there condition is not exactly satisfactory. Potatoes, short crop and sadly diseased. Hay and grass very deficient yield.

N.B.—Belgium will this campaign import a considerably larger quantity than last year, for the simple reason, she has not only her usual home customers to supply, but will no doubt have a considerably greater quantity to supply to the Rhenish Provinces and France.

SWITZERLAND.—The severe and protracted winter, cold and dry spring, and droughty summer has caused this year's harvest to be deficient, particularly meadows, and pastures suffered extensively, and produced less than half a crop.

N.B.—Switzerland will require more aid than last season, and will have to draw her supplies from Austria, &c., instead of from Marseilles.

GERMANY.—**BAVARIA AND SOUTHERN DISTRICTS:** In spite of the abnormal weather in early summer, the crops are represented tolerably good. **SAXONY (Central Germany):** heat and rye vary according to the soil, and how the plants were covered in February with snow to protect them from frost. Rain did harm to the crops during the harvest, and quantity is considerably less than last year, and quality poorer. Wheat much sprouted. Rye is the best crop of the season in regard to quality, being mostly secured ere rain set in. Barley and oats fair yield, but sadly lessened in quality from rain, particularly oats. Potatoes short crop; suffered greatly from wet. Oilseeds tolerably good. **BERLIN DISTRICTS:** Crops leave much to be wished for, rye excepted, which is a tolerably good crop; but wheat, barley, and oats are not satisfactory. **TILSIT AND MEMEL DISTRICTS:** Wheat a full crop, and though here and there secured rather damp. Rye nearly an average. Barley and oats also satisfactory. Linseed middling crop. Peas suffered from worms, otherwise not bad crop. Hay rather short. **KONIGSBERG DISTRICTS:** Usual breadth sown with autumn grain in a good state; got well through the winter. Spring grain less planted, but under good auspices. The crops were secured under various circumstances, and thus there is a great variety of grain from very fine to very bad. Wheat full average, quality variable, weight 56lb. to 61lb., condition various. The same may be said of rye and barley; weight of the former 56lb., of the latter 50lb. Oats below an average, quality various; weight 34lb. to 36lb. Peas below average yield, but good in quality; weight 64lb. Oilseed below average. Potatoes moderate average. **DANZIG DISTRICTS:** Usual breadth sown under good auspices, and in spite of the severe winter all cereals got well through, except rubenseed, which suffered more or less. Spring-sown grain not so good, though not badly got into the soil. The result of this year's harvest would have been in every respect very good had it not been for the rainy weather and the want of hands at harvest time. Wheat good average yield: quality various; weight 56lb. to 61½lb. Rye good yield, though not so good as in 1869; weight 58lb. Peas 16 to 25 per cent. below average; quality not very good. Barley under average; middling quality. Oats moderate average, and suffered much from rain. **POSEN OR PRUSSIAN POLAND DISTRICTS:** Wheat 90 per cent. of an average; quality

various; here and there sprout; in some districts the quality is better than in others. The same applies to rye; the yield in quantity, however, is 5 per cent. less (ergo, 85 per cent. of an average). Barley goodish crop, except in the parts where sowing was delayed; rather lighter in weight. Oilseeds short crop, a great deal having been ploughed up. Peas suffered from maggot and rain. Oats a moderate crop. Feeding stuffs and potatoes good. **SILESIA DISTRICTS:** Crops, on the whole, satisfactory in quantity, but rain did harm, particularly in the hilly districts, so that at least one-third of the wheat, barley, and oats suffered much in quality and condition, being more or less sprouted. Rye is the best quality, having been mostly secured before the rain. Potatoes satisfactory crop. **UPPER POMMERANIAN AND STETTIN DISTRICTS:** Pommeranian wheat, much under an average; quality middling, weight light. Rye, average; quality good; weight 56lb. to 58lb. Barley, full average; quality inferior, having suffered from rain. Oats, about average in yield; quality various. Peas, fairish yield. Potatoes, half a crop. **STETTIN DISTRICTS:** Usual breadth sown in autumn, under good auspices, but the autumn was too cold, and the seed could not germinate, and went rather spindly out the winter, which was very severe, and in many places little snow had fallen to protect the plants. The usual kinds of red wheat withstood the winter best, although the plants looked miserable in spring; nearly all fine English grades and fine white Polish wheat, which have been much in vogue in the Uckermark and Pommeranian districts, had to be ploughed up and re-sown in spring with spring grain. Rye withstood the severe winter best; only in the wet cold fields is there any loss of plants. Rain at harvest time did great damage, affected the quality and condition of the crops seriously; wheat is sprouted, chiefly on the coast districts, and the yield is not two-thirds of an average, weight 60lb. Barley, good average yield, weight 50lb., suffered from rain, and the colour is rather dark, sprout is more or less prevalent. Oats, full average, quality deteriorated by rain and somewhat sprouted, weight 35lb. Peas, full average, partly very soft and sprouted. Oilseeds, about two-thirds of an average. **LOWER POMERANIAN (ANCLAM, WOLGAST, GRIEFSWOLD, DEMMIN, ISLAND OF RUGEN, STRALSUND, AND BATH) DISTRICTS:** Usual breadth sown in autumn under fair auspices (except in the Stralsund districts, where the soil was very wet), and promised tolerably well at first, but winter set in severely, with little or no snow covering, and upset the good prospects, and the so-called Scotch grades perished nearly entirely; the soil was re-ploughed. The crops again suffered by drought, and, last of all, rain during the harvesting has done a great deal of harm to the condition, sprout being prevalent to a great extent. The land ploughed up was re-sown with spring corn and dodderseed. Rye was mostly secured before the rain set in, and thus the quality is good. Barley and oats suffered in quality, condition (sprout being prevalent), and colour from rain. Wheat yields 65 per cent. of an average, weight 58lb. to 60lb.; the wheat grown from home-grown, and mixed with Holstein seed, has less sprout and weighs 61lb. to 62lb., as this plant withstood the wet better. Rye, 75 per cent. of an average, weight 57lb. to 59lb. Barley, oats, and tares full average. Barley weighs 50lb.; oats 36lb. per imperial bushel. Potatoes, three-fourths of an average. Hay, nearly an average. **ROSTOCK AND WISMAR (MECKLENBURG SCHWERIN) DISTRICTS:** Usual breadth of land sown in autumn under favourable circumstances. The winter set in severely with little or no snow. Oilseeds suffered, and the so-called English grades of wheat, which of late years have found increased cultivation in Mecklenburg, suffered very severely from frost in January and March, and later on from night-frosts, so that three-fourths of the soil sown with said qualities was ploughed up and re-sown with spring wheat, barley, and dodderseed. The rain, which fell daily during the latter part of harvest, did great damage to the quality and condition, so that sprout is prevalent more or less. Wheat, half to two-thirds of an average in yield, average weight 60lb. Rye, average yield, quality good, average weight 50lb. to 51lb. Oats, 10 per cent. above average. Peas, three-fourths of a yield. Oilseeds, one-third of an average. **LUBECK DISTRICTS:** Wheat, moderate average, quality poor, weight 58lb. Rye, about an average, quality fine, weight 58lb. Barley and oats not satisfactory, colour dark, weight light. **HAMBURG DISTRICTS:** Crops suffered severely during the housing,

which was protracted, owing to the want of hands. The autumn seed was well got into the soil, of which an extra breadth was planted, but the frost destroyed the whole of the plant grown from Scotch seed, which was sown to a great extent in this district, and rivets in the provinces, and Brandenburg and Saxony; thus there is a large deficiency in the quantity and quality grown, and the quality and condition sadly lessened from rain, sprout being more or less prevalent, and the colour also not good; weight ranges from 54lbs. to 60lbs., but the largest quantity offering weighs 58lbs. to 59lbs., very seldom 60lbs. Rye fine yield, quality good, weight 50lbs. to 58lbs. Barley moderate average, quality damaged by rain, and a large quantity only fit for feeding. Oats a full crop, quality and condition damaged by wet. Potatoes moderate yield. **HOLSTEIN AND SCHLESWIG DISTRICTS:** The yield has turned out deficient, and wheat less than an average, the yield having been lessened by large parcels being ploughed up, which had been killed out by the severe winter, and re-sown with corn; average weight 57lbs. to 61lbs. Barley large crop, quality various, mostly damaged by rain; weight 52lbs. to 54lbs. Oats good yield; weight 36lbs. to 40lbs. Peas a fair crop, quality variable. Potatoes good. **SCHLESWIG:** Wheat grown from Scotch a failure, and had to be ploughed up again, whereas that grown from home seed has withstood the frost better; but even this suffered, and had more or less to be ploughed up; more spring corn sown, therefore. Buckwheat sown to a greater extent. Wheat small yield; quality good, heavy weight and good condition. Rye, Barley, and Oats good crop in every respect. **BREMEN AND OLDENBURG DISTRICTS:** Usual breadth sown, but owing to the unfavourable winter a good deal had to be ploughed up and re-sown with spring corn under favourable auspices. The result of the harvest varies according to the soil, and how far the frost and wet had done harm in the different localities. Wheat half a crop; but wheat plays a very insignificant part in this district; quality and condition moderate; weight 57lbs. to 58lbs. Rye two-thirds of a crop, fine quality. Barley full average. Oats ditto. Peas and beans 25 per cent. short of last year. Potatoes good yield, and little or no disease. **EMDEN AND LEER (HANOVER) DISTRICTS:** Owing to the wet weather little autumn grain sown, and that little not under good auspices; it got tolerably well through the winter. In consequence of less wheat there was more spring corn sown, particularly oats, which is the chief article of produce in the above districts; then comes beans. Per acre wheat is an average, poor quality, light weight. Barley tolerably good. Oats above an average, quality tolerable. Beans half a crop, quality middling. **RHINE DISTRICTS:** Crops not by any means good; first the drought, and then the continued rain in July and August, accompanied by violent storms, did great damage. Wheat and rye only about half a crop. Oats a very middling yield. Feeding-stuffs poor yield, and hay is dear. Potatoes very moderate yield, and those grown are very much diseased, so that the crop is only half a one; indeed, early potatoes gave only one-third of an average. Such is the scarcity of this article that the rate of carriage is reduced to a mere mite per cwt., nearly the twelfth part of three farthings per German mile ($4\frac{1}{2}$ English ones) on the State railways, and the Government have recommended private companies to follow the said humane example. **WESTPHALIA DISTRICTS:** Crops not satisfactory; indeed, the importations must be drawn from other better-situated districts per rail.

N.B.—Taking into consideration that Galicia, Moravia, and Hungary will no doubt ship *via* Stettin, and although the central Rhenish and southern districts require much aid from the more favoured ones; yet we think that 1,500,000 qrs. of wheat and flour will be about the quantity that may be exported from Germany. Last year we put down the probable exportation at 1,250,000 qrs., which proves to be near the mark, as the quantity exported in the campaign from 1st September, 1869, till 1st September, 1870, was 1,342,268 qrs. of wheat and flour.

DENMARK.—Usual breadth sown under good auspices; got through the winter well; but having partly suffered from rain, the condition in such cases is not satisfactory, and here and there sprout is prevalent in wheat, which is not a full average; the weight varies from 56 lbs. to 65 lbs. Barley a good crop in every respect, weight on the average 53 lbs. to 54 lbs. Oats rather under average in every respect.

NORWAY.—Usual breadth sown under good auspices; got well through the winter, except in some parts, which suffered

from the severe frost without snow. The crops in general are a moderate average; quality very fine. Barley in particular is of a very fine bright colour and heavy weight—say, 53 lbs. to 55 lbs. Rye 56 lbs. to 58 lbs. Oats 37 lbs. Potatoes, excellent crop and no disease.

SWEDEN.—Generally speaking, the crops are good. Wheat and rye, quantity, quality, and condition satisfactory, wheat weighing 59 lbs. to 62 lbs., Rye 56 lbs. to 62 lbs. Oats a full average, fine quality, and weight 37 lbs. to 40 lbs. Only in some districts this article has been housed damp, and therefore not so fine in colour and condition as the greater part of the crops. Barley also is here and there secured somewhat damp. Potatoes an average. Hay below an average.

N.B.—Scandinavia has again been blessed with good crops; those of Denmark are not quite so good as last season. We fancy that Sweden will export the same quantity of oats, and Denmark the same quantity of wheat as last year.

RUSSIA.—In the Southern Governments the crops in point of quantity are very large; but the quality is not altogether satisfactory, the rain set in during the cutting, retarding the same, and somewhat deteriorating the condition, colour, and weight of at least one-third of the crop. Rye and spring corn middling. In the South-eastern Governments the yield is not so large (having suffered from frost in winter and hail in summer), nor the quality better than in the southern districts. In the Caucasus Government the quality, condition, and weight are good, but the yield less abundant. In the East-south-eastern Government the crops were secured in pretty fair order, and before the rainy weather set in. The Western Government's crops are deficient, having suffered from rain: those in the Central Government fall short of an average. In Russian Poland the crops are good, in the Western districts they have seldom been much better; the Eastern districts not so good; in the Northern ones tolerably good. In the Southern, spring crops suffered from adverse weather. In Northern Russia the worst crops are to be found, most of the winter-sown grain had to be ploughed up, and re-sown with spring corn, which cereals also have not yielded well, owing to drought. In the Baltic provinces usual breadth sown with winter grain under good auspices, wintered well; nearly the usual breadth of land was favourably sown with spring corn. The cultivation of flax is steadily on the increase, and the crops in general are good in every respect.

N.B.—We put down the probable export from Russia at 2,500,000 qrs. wheat, owing to the increased, and yearly increasing breadth of land sown with grain in southern, south-eastern, and east-south-eastern Russia.

AUSTRIA AND HER PROVINCES (GALLACIAN, BOHEMIAN, MORAVIAN, AND HUNGARIAN DISTRICTS): PROVINCE OF UPPER AUSTRIA.—The frost and hail did harm in some district; but, on the whole, the harvest is tolerably good. Wheat, better than last year, though here and there rust is to be found; the condition suffered somewhat from rain during harvest in some localities. Rye suffered much from frost, but in most of the districts yield and quality are good. Barley and oats suffered from drought, but the crop is tolerably fair in every respect. Potatoes, defective; hay and grass less than an average. **LOWER AUSTRIA:** Wheat and rye, very deficient yield. But quality pretty good. Oilseeds also defective. Potatoes and beet-roots short yield, having suffered from rain. **GALICIA:** If the crops are not brilliant they are not bad, they suffered to some extent from vermin; rats and mice appear to be constant customers in Galicia, this season they have come and gone three times. Wheat is a good average, quality very good, though in some unimportant districts smut is prevalent. Rye, not so good though not bad. Barley less grown, and it is thought that towards the end of the season an importation of this cereal will be wanted. Peas and Beans not satisfactory in any respect. Buckwheat a full crop. Potatoes not satisfactory, particularly in the low situated localities.

BOHEMIA.—Crops not satisfactory, suffered in summer from drought; wheat withstood the winter well and yet the yield is very middling. Rye is even more unsatisfactory. Spring corn suffered most. Barley, is half a crop. Oilseeds, not near by the crop expected. Potatoes, tolerably good. Hay, partly damaged. **MORAVIA:** Wheat only a very moderate average. Rye, very satisfactory crop. Barley, also good yield, the only fault being rather dark in colour. Oats, good average. Peas, middling yield; horse beans, fair yield; potatoes tolerably

good. **HUNGARY:** Up to the end of July or beginning of August everything promised well, so much so that the crops led to the full expectation of being among the best in point of quantity and quality grown during the last ten years in Hungary, wheat excepted, said cereal not being equal to the growth of 1869, less land being sown owing to the wet autumn of 1869, and the rainy weather which set in in August and September, and did much harm to the condition and quality of the grain not then secured. Wheat is nearly an average, quality various, and where it suffered from wet the weight is lighter by 8lb. Rye, seven-eighths average. Barley suffered from the wet weather, and is deficient 20 per cent. in the yield in every respect. Maize also suffered from rain, so that a great part is only fit for feeding purposes; in the districts of Banat, Bačka, and Syrmien is a good yield, but only about two-thirds of that is good quality, the other is only fit for feeding. Oats suffered in quality from the wet weather which affected the weight, condition, and colour, the latter being dark, but the yield is about an average. Potatoes, deficient, and in some districts diseased. Oilseeds, about an average.

N.B.—The official account in September gave the yield of the various cereals as follows: Out of 40 districts, wheat was good in 19, middling in 15, bad in 6; out of 52 reports received from various districts, rye was good in 21, middling in 17, and bad in 14; out of 46 reports received, barley was good in 20, middling in 14, bad in 12; and oats 33 good, 10 middling, and 3 bad. Feeding-stuffs, good. Oilseeds, about an average. Our own idea is, that Hungary will export about 1,250,000 qrs. wheat and flour.

TURKEY AND DANUBIAN DISTRICTS (MOLDAVIA, WALLACHIA): **TURKEY.**—Crops are not good, being under an average in quantity, quality, and weight. **DANUBIAN DISTRICTS:** The winter played hard on the seed, and in some districts hail and excessive rain did harm during the summer. In **MOLDAVIA** crops on the whole tolerably satisfactory. **WALLACHIA:** With the exception of maize (which is deficient 20 to 25 per cent. having suffered from hail and excessive rain in some districts), the crops are tolerably good in every respect.

N.B.—We put down the probable export of the Turkish dominions and Danubian Principalities, at not more than 600,000 qrs. Wheat.

SPAIN AND MEDITERRANEAN DISTRICTS.—**SPAIN:** Up to June 24 the crops, particularly barley, promised abundance, and it was expected that Spain would require little wheat and be able to spare some barley, but towards the end of that month, and early in July, locusts did some damage in the greater portion of the country, particularly in the southern provinces, so that in those districts the yield is very deficient, and Spain will require fully as much foreign help as last campaign of wheat. **PORTUGAL:** Crops very deficient, in some localities next to a failure, owing to excessive heat and drought. **ITALY:** Crops suffered first from drought and heat, then at harvest time from rain, so that the yield is defective. Wheat 25 per cent. below an average, and quality not satisfactory; the yield of beans and oats very small. Maize also a short yield.

N.B.—Spain, Portugal, and Italy will require fully the same foreign aid as last year, particularly the two former countries.

ALGERIA.—Crops pretty good of barley and wheat, but in the districts bordering on the desert the crops have suffered from locusts; few beans planted or grown this year, but more maize.

EGYPT.—Crops very satisfactory in every respect, in both Upper and Lower Egypt, owing to a larger breadth of land sown, and Old Father Nile having done his duty this year.

N.B.—Egypt will this campaign export about 250,000 qrs. wheat and 100,000 to 200,000 qrs. Beans.

AMERICA.—Considerably less breadth of land sown with wheat last fall and this spring; opinion varies as to quantity, some say 500,000 acres, others as much as 900,000 acres less, seed time was not over favourable, the winter was in many sections severe and protracted, with alternate frost and thaw in February; in others the winter was open, with sudden changes from warmth to extreme cold; in both cases this did considerable harm by killing out the wheat plant. The spring was late and cold, and less land sown with spring cereals. April was pretty favourable, but in May, June, and July the weather became dry and hot, which again did harm to the crops, particularly wheat, which suffered severely in the chief

wheat-growing districts (Western States), where the yield is reported at not more than two-thirds of the yield of 1869. At harvest time the quality and condition promised to be splendid, but as the saying goes, "there is many a slip between the cup and the lip," and so it was in this case, as heavy and long-continued rain set in soon after the wheat was cut and before it was stacked, and with such force that it penetrated the stacked (the straw being short-made it is difficult to stack so as to throw the water off), and the result is that much of this is badly damaged, damp and sprouted, whilst one-quarter being in the field was almost rendered useless. Rye and barley crops are about equal to last year's yield, namely, the former fine, the latter 20 per cent. below an average. Oats are better than might have been expected. Maize was damaged in many sections by frost, drought, heat, and vermin, but not to an extent to lessen the total yield, the more so as the land not sown with wheat was sown with maize; on the whole the maize crop is one of, if not the best. Buckwheat 10 per cent. below an average, owing to mildew. Hay and grass very deficient owing to the drought. Potatoes about an average, though this useful esculent suffered in some sections from drought and other causes, particularly the western States. **CANADA:** The want of rain in Upper and Lower Canada was very much felt; in June, particularly, the heat and drought did harm. Wheat is a short crop. Barley, tolerably fair. **CALIFORNIA:** Three per cent. more wheat sown, but the aggregate yield of wheat considerably, say about one-third, below an average; mildew and rust in many sections prevalent. Maize also short of an average. Barley, about an average. **CHILI:** Harvest very fair. **AUSTRALIA:** Crops deficient owing to drought.

N.B.—Considering the shortness of the yield in point of quantity, quality, and condition in the chief wheat-growing States, of spring corn and feeding stuffs, we fancy we shall not be going far wrong if we put down the probable export from America (Canada, California, Chili), and Australia, at 4,000,000 qrs., or 1,000,000 qrs. less than last campaign.

STOCKS.—In the seaports of Great Britain and Ireland, on the 1st September, were, with the exception of London, Liverpool, Hull, and Glasgow, light; and what is held at the above ports, particularly London, is of inferior quality. In France, Belgium, Holland, Germany, and Scandinavia, stocks were moderate on said date, and at the shipping ports in the United States, Russia, and the Danubian Principalities, they were by no means overwhelming.

RICE.—Crops promise to be similar to last year; for this article the opinion is good. The quantity imported into Europe, this year, amounts to 67,000 tons less than same time last year.

SEED TIME.—With the exception of Hungary and France, we have not heard that the autumn sowing has been effected under unfavourable auspices, the only complaint being, that it has been later and more protracted than usual. The British farmers have sown a much larger breadth of land with wheat this autumn. In Hungary, however, it was very unfavourable, it having rained without intermission three weeks and more. Neither have we heard as yet any complaints of importance as to the standing of the young plants. In France, in the districts not occupied by the Prussians, seed time has gone off well, but, of course, the damage done in the Alsace and Lorraine district is irretrievable this fall; we will hope that that unfortunate country may be favoured with a genial spring, so that what land has not been sown and trampled down in autumn, may be sown in spring under favourable circumstances.

PRICES.—**KÖNIGSBERG,** Dec. 13.—Weather winterly, and the navigation from here to Pillau may be considered closed, and particularly so for sailing vessels. High-mixed wheat, 58s. to 54s.; mixed ditto, 51s. to 52s.; red ditto, 50s. to 51s. per 500 lbs. Barley, feeding quality, 27s. per 448 lbs. Oats, 18s. 6d. per 386 lbs., and linseed, 50s. per 424 lbs. f.o.b.

DANZIG, Dec. 13.—Weather hard frost, shipments can only be made from fair water. Trade firm, and prices pointing upwards. 61 lbs. fine high-mixed wheat, 53s. 6d.; fine white 60 lbs. ditto, 53s.; good-mixed 59 lbs. ditto, 51s. 6d. per 496 lbs. f.o.b. per immediate and 1s. more per spring shipment. Rye according to quality, and weight, 36s. 6d. to 35s. 6d. per 480 lbs. Barley, large 53 lbs. malting, 29s. 6d.; small 49 lbs. feeding, 28s. 6d. per 448 lbs. Peas, fine white boilers 36s.

good white dry feeders, 34s. per 520 lbs. for immediate, and 6d. to 1s. more per spring shipment.

STETTIN, Dec. 16.—Winterly weather; the passage of our river is now impeded by ice. Market firm, 59 lbs. to 60 lbs. marks, 52s. per 504 lbs. 51 lbs. to 52 lbs. Oderbrück barley, 30s. 6d. per 448 lbs. 64 lbs. to 65 lbs. feeding peas, 37s.; boilers, 40s. per 520 lbs. f.o.b. per first open water in spring.

ANCLAM, WOLGAST, GRIEFSWOLD, DEMMIN, AND STRALSUND, Dec. 16.—Supplies moderate, demand lively for what is offered for sale. 60 lbs. wheat, 48s. per 500 lbs. 58 lbs. to 59 lbs. rye, 35s. per 480 lbs. 50 lbs. barley, 28s. per 432 lbs. 34 lbs. to 35 lbs. oats, 20s. per 320 lbs. Peas, 35s. per 520 lbs. free on board.

ROSTOCK, Dec. 17.—Navigation still free. We beg to remind our friends that our port is the last closed in winter and the first to open in spring, which is often of great value to parties who may wish to have their shipments off ere the gross of those from the Upper Baltic, &c., arrive. Supplies are very small, in spite of the approaching Term week, when Christmas accounts, servants' wages, rents, and interests on mortgaged estates must be met. The little offering is greedily snatched at

by our millers for home use, or by dealers for sending off per rail to the Rhenish provinces, Westphalia, Bremen, and Hamburg. Only two very small cargoes, consisting one of old and one half-old and half-new wheat, have been shipped this fall, and said cargoes went one to Holland and the other to Belgium, to which latter country a couple of small cargoes have been sold per spring, at 59-60 lbs. new wheat at equal to 55s. per 504 lbs. f.o.b. We note to-day our good average new wheat 52s. per prompt, and 54s. per spring, f.o.b. 504 lbs. 51-52 lbs. barley 28s. 6d. per 427 lbs. f.o.b.

WISMAR, Dec. 16.—Prices about the same as ours, probably somewhat cheaper.

HAMBURG, Dec. 16.—Market steady, chiefly for home wants, and now and then to complete a sale to Belgium, &c., there has been more doing in the so-called delivery wheat, at improved rates. Wheat, Holstein, 57-59 lbs., 51s. to 53s.; better grades, 60-61 lbs., 54s. to 55s.; Mecklenburgh, 59-60 lbs., ditto, 53s. to 55s.; Marks, 57-59 lbs., ditto, 52s.; and delivery wheat, per April-May, sellers' option, 55s. f.o.b. per 480 lbs. Barley, Saale, 52 lbs. to 53 lbs. Chevalier, 37s. 6d.; finest ditto, 42s., per 448 lbs. f.o.b. Oats, Mecklenburgh, 23s.; Holstein, 23s. 6d., per 424 lbs. f.o.b.

LINSEED, LINSEED CAKE, AND OIL TRADES.—ANNUAL REPORT.

TO THE EDITOR.

SIR,—We trust our Annual Circular will not lose its customary interest from the fact of our having so few fluctuations to call your attention to; the past year, like its predecessor, having been marked by no incidents calling for special notice, and in that respect being in strong contrast with some of those we have formerly had the pleasure of addressing you upon. The trade has been of a very steady character, and we trust fairly remunerative alike to importer and consumer. The distressing war raging between our Continental neighbours caused some monetary excitement in our markets, as it was thought, when first declared, that it might probably involve complications affecting the supply, but none such having arisen, business has relapsed into its ordinary channels, and the close of the present and prospect for the next season may be regarded with satisfaction by all whose interests are concerned in the trade.

LINSEED.—Early in January 56s. 6d. was paid for coast cargoes of Black Sea, and 59s.; for arrived Calcutta, it improved 6d. per quarter by the middle of the month, but was rather easier at its close. In February free arrivals put the value of the former to the lowest point of the year, say, 56s., at which several cargoes were placed, and Calcutta realised 59s. to 58s. 6d. We had an improvement to 57s. and 57s. 6d. for Black Sea in March, and 59s. to 59s. 6d. for Calcutta. April opened with steady market at same rates, but short supplies later on, improved the value to 60s. for Calcutta, and Black Sea in absence of arrivals was quoted nominally 58s. to 58s. 6d. In May, stocks being nearly cleared out, Calcutta advanced from 60s. to 61s. 6d., Black Sea 59s. to 59s. 6d. June ushered in a quiet market, but very soon the prospect of drought affecting the hay crop, caused a great desire on crushers' part, to supply themselves forward, and very large sales were made of Black Sea to be shipped at 60s. to 61s., and afterwards, dry weather continuing, 61s. 9d. and 62s. was paid, while spot Calcutta advanced to 63s. 6d. Rain falling at the end of the month, caused a quieter tone. Early in July there was a very dull trade, with lower prices, but subsequently renewed apprehensions of drought, and the possibility of political complications, gave an impetus to the market, and a large business was again transacted at 61s. 6d. to 62s. for Black Sea cargoes, while spot Calcutta sold at 64s., or the highest prices paid during the year. The market in August was influenced by the state of political affairs on the Continent, causing a fear of interruption of the oil export, and this, coupled with the rise in the bank rate of discount, soon brought prices down again, and by the end of the month, 59s. was accepted for Black Sea cargoes—spot Calcutta, owing to scarcity was not affected so much and sold at 63s. In September, in expectation of liberal supplies from India, a further decline took

place, 57s. was accepted for 10,000 qrs. Black Sea for shipment; but later on 6d. to 1s. advance was obtained for a considerable quantity. Spot Calcutta declined from 62s. 6d. to 61s. Free arrivals of Black Sea took place in October, and a good many cargoes changed hands at 57s., and afterwards 3d. to 6d. more paid. Calcutta receded to 59s. on the spot. In November very large supplies of Calcutta promised to send the value of this description down considerably; however, at this time, the fears entertained of a war with Russia caused a good inquiry and prevented the expected fall; a large speculative business ensued in Black Sea cargoes, for October and November shipments, at 59s. to 59s. 6d., and arrived Calcutta made same prices. The trade in the early part of December was quiet, 59s. was paid in a few instances for November bills lading, from the Azov; on the spot the inquiry was limited, and 57s. to 58s. was accepted for Black Sea ex steamer, and 58s. 6d. to 58s. 3d. for Calcutta. For the coast cargoes the demand was rather more active, and, aided by some continental orders, a clearance was effected at from 57s. to 58s. The quality of our imports this season has been satisfactory, Calcutta and Sea of Azov particularly so, the shipments from the Azov have generally commanded a preference over Odessa seed, which has not been so well liked. For next season's supply, taking into account the reports from the various districts, we have no reason to believe the quantity will be less than an average. Stocks in mills are about on a par with last year. The stock of seed in public warehouses here and afloat in the docks amounts to 55,000 qrs., at Liverpool 6,000 qrs., and at Hull there are 111,000 qrs., in addition to the quantity held by crushers, which is roughly estimated at 36,000 qrs. Afloat there is about 340,000 qrs., consisting of 125,000 qrs. East Indies, 190,000 qrs. Black Sea, and about 25,000 qrs. Mediterranean, Baltic, and sundries. Below are annexed the respective annual official returns of the aggregate imports into the United Kingdom:

	Qrs.		Qrs.
1859	1,270,911	1865	1,435,414
1860	1,330,623	1866	1,158,736
1861	1,160,270	1867	1,095,360
1862	1,088,472	1868	1,625,518
1863	1,104,578	1869	1,387,573
1864	1,434,973	1870	will be about 1,425,000

At Liverpool and Hull, the import has been in excess of last year; London has imported about same quantity. London has imported 353,446 qrs., consisting of 210,149 qrs. from East Indies, 42,262 qrs. Black Sea, 5,356 qrs. Mediterranean, 88,954 qrs. Baltic, and 6,725 qrs. Archangel. The re-export is again small, being about 33,000 qrs. The aggregate import into the United Kingdom is made up of 320,000 qrs. Calcutta and Bombay, 475,000 qrs. from St. Petersburg, 42,000 qrs.

from Archangel, 97,000 qrs. Riga (including 40,000 qrs. sowing seed), 75,000 qrs. from Memel, Königsberg, Dantzic, Pillan, and other Lower Baltic Ports, 315,000 qrs. from the Black Sea, and remainder Mediterranean and sundries. The Black Sea cargoes coming to direct ports, and calling at Falmouth for orders, consisted of about 323,650 qrs.; which were discharged as follows: Hull, 125,400 qrs.; London, 32,300 qrs.; Grimsby, 32,300 qrs.; Ipswich, 26,000 qrs.; Boston, 20,150 qrs.; Bristol, 18,750 qrs.; Gloucester, 11,250 qrs.; Lowestoft, 11,100 qrs.; Leith, 9,900 qrs.; Southampton, 4,450 qrs.; Rochester, 4,100 qrs.; Berwick, 2,400 qrs.; Stockton, 2,350 qrs.; Bridgewater, 1,900 qrs.; Lynn, 1,700 qrs.; and Newhaven, 1,600 qrs. 1,800 qrs. went to Holland; 1,900 qrs. to Belgium; and 4,300 qrs. to France. The direct exports from the north of Russia to the continent have included 84,000 qrs. from St. Petersburg; 43,000 qrs. from Archangel; 55,000 qrs. from Riga; and about 100,000 qrs. Memel, Königsberg, &c.; also some 33,000 qrs. sowing seed from Riga.

LINSEED OIL has, during the past year, shown very little of the fluctuations usually characterising this article. The home trade has been a very good one, and the export, although somewhat interfered with by the war on the Continent, during the summer months, has latterly been large, and will be found very little short of 1869. The value in the beginning of January was £29 10s. per ton, advancing to £30 5s. by the middle of the month, and after a slight decline closed firmly at £30 10s. to £30 15s. In February we had an improvement of £1 per ton, and during March £32 was paid, with a very steady home demand. In April £32 10s. to £32 were the values, and £32 to £31 10s. in May; during June and early July, these continued the spot quotations, but at the end of this month it receded to £31; afterwards a further fall occurred to £30 and £29 10s. in August, but the price rallied to £31 5s. by the end of September. In October £30 10s. to £29 10s. were the quotations, and £29 15s. to £30 10s. in November; £29 10s. to £30 have been accepted in December, and the market is to-day firm, at £30 to £30 5s. per ton.

MONTHLY PRICES OF LINSEED-OIL, 1870. — January, £29 10s. to £30 15s.; February, £31 to £32; March, £32; April, £32 10s. to £32; May, £32 to £31 10s.; June, £32 to £31 5s.; July, £31 15s. to £31; August, £30 10s. to £29 10s.; September, £29 10s. to £31 5s.; October, £30s. 10s. to £29 10s.; November, £29 15s. to £30 10s.; December, £29 10s. to £30.

The exportation during the past year will be found rather short of 1869. It amounts to about 31,000 tons in 1870, against 32,000 tons in 1869, 30,000 in 1868, 20,000 in 1867, 25,000 in 1866, 37,000 in 1865.

LINSEED CAKES have been in fair consumption throughout the year. The drought in the summer having so greatly affected the hay crops, was expected to have largely improved the demand for linseed cakes; but other feeding stuffs, more particularly maize, being relatively very cheap, have in a great measure counteracted the effects of it. Prime London-made cakes were quoted in January £11 to £11 10s. per ton, and continued about these rates until June, when a rise of 10s. per ton occurred; the value remained £11 10s. to £12 until August, when it was quoted £12 10s. This rise was maintained until the middle of September, when a decline of 10s. per ton was experienced, and the price has since been quoted £11 10s. to £12. Of foreign we have had a fair supply—say 160,000 tons of all kinds, into the United Kingdom. There has been a moderate inquiry only throughout the year. In January £10 10s. to £10 15s. was quoted for best American bags, and £11 to £11 5s. barrels. There was a fall of 10s. per ton by March, and afterwards an advance to £11 15s. and £12 respectively by July, and prices have since declined about 10s. per ton. To-day value of bags is £11 5s. and barrels £11 15s.

RAPESEED has been in very large supply from the East Indies, but the import has not proved more than sufficient for our wants, and although it was expected that the war between Prussia and France would tend to cause a fall in prices, owing to so large a quantity of seed on its way to Havre, having to come upon this market, values have improved considerably, and a fair proportion of our imports have found their way to Holland and Belgium, where the crops have been very deficient; some quantity has also been shipped to this country from the Danube, instead of going to Marseilles, and has sold at continuously improving rates, the early cargoes having made 62s. and recent shipments sold as high as 72s. The value of

ordinary brown Calcutta in January was quoted at 59s. 6d. to 60s. 6d., and improved 1s. per qr. in February, during March 61s. 6d. to 62s. 6d. was paid, and these were the values in April; in May it advanced to 64s., which was also the quotation in June; during July 64s. 6d. to 65s. was paid, but at its close prices gave way in view of the large quantity afloat, and the lower rates accepted for arrival, and 63s. to 62s. 6d. were the quotations in August. Early in September 1s. more was paid, but during the month 62s. to 61s. was accepted. In October an improvement took place, from 62s. to 64s. 6d., and a rise of another 1s. in November, and there has been a good demand the past month at 66s. to 67s. per qr. To-day 67s. is the value.

RAPE-OIL.—The home make has been very large; but small supplies of foreign, and the effect of the heavy stocks held in Paris being neutralised by the war, have given a quite unexpected impetus to the trade. The price of English brown advanced from £39 in January last to £44 in June. A reaction ensued after this, and a drop to £41 occurred by September, but £44 was again paid early in November, and £46 to £48 in December. To-day £47 5s. is the quotation.

RAPECAKES continue to be extensively used here, also to find a ready sale to the Continent. Values after January varied very little throughout the year. In January English-made, from East India seed, sold at £6 5s. to £6, in February and March £5 15s.; £5 7s. 6d. was accepted in April, but in May, June, and July £5 15s. was again the quotation. About £5 10s. was its price until October, and £5 15s. in November and December.

COTTONSEED.—The supply of this article will be found largely in excess of any previous year, the importation into the United Kingdom amounting to 125,000 tons. Notwithstanding the additional quantity, the consumption has proved so large that, except at Hull, stocks of old seed were quite cleared off by the end of October. Prices in the spring, with the prospect of a large import, looked likely to range low, but a considerable speculative inquiry soon dispelled this view. In March the lowest price of the year was touched, when £8 5s. was accepted, and then only in the case of two or three cargoes. The value in January was £9 5s. to £9 7s. 6d., February £9 5s. to £8 17s. 6d., March £8 12s. 6d. to £8 5s., April £8 12s. 6d. to £9 2s. 6d., May £9 2s. 6d. to £9 5s., June £9 5s. to £9 15s., July £9 10s., August £9 10s. to £9, September £8 15s. to £9 9s. 6d., October £9 2s. 6d. In November new seed by steamer made £9 15s. to £10, and £10 was paid for arrived parcels early in December, and £9 15s. to £9 10s. since. A fair amount of business has taken place in new seed at from £9 15s. to £9 10s. for October shipments, £9 7s. 6d. to £9 2s. 6d. November, £9 2s. 6d. to £9 December, and £9 January. To-day the spot value is £9 7s. 6d. per ton.

COTTON OIL.—We have nothing more to record of this article beyond a fair sale the first six months of the year, since when the export of refined oil to the Mediterranean has been much smaller than usual, and prices affected in consequence. The value of crude in January was £31 to £31 10s. per ton, £32 to £32 10s. in February, £32 to £31 10s. in March, £31 to £31 10s. in April, £31 in May, £30 15s. to £29 10s. in June, £29 5s. to £30 in July, £29 to £28 in August, £27 10s. in September, £29 in October, £28 to £26 in November, and £26 in December; while oil made from seed or 1870 crop has made £3 per ton above these values. To-day new oil is worth £28 per ton.

COTTON CAKES have continued to attract considerable demand, and, although the make has been very large, the mills in the autumn were quite bare of stocks, and the article has since been exceedingly scarce, and improving in value. The price in January was about £5 15s. to £5 7s. 6d. in February, £5 5s. to £5 10s. in March, about £5 10s. in April, in May £5 15s. to £6, in June £6 to £6 10s., July, August, and September £6 10s., October £6 15s., November £6 15s. to £7, and in December £7 5s. To-day £7 to £7 5s. is the value.

TALLOW.—The price of S.Y.C. in January was 46s. 6d. to 46s., and continued steady at same rates until end of March, when 45s. was accepted. 44s. 9d. to 44s. 6d. were the quotations in April and May, and in June and July 45s. 6d. to 46s.; it declined to 42s. 9d. by end of August; 44s. 6d. to 44s. 9d. was paid in September; the value slightly declined until December, when the same rates were again obtained.

EDWARDS, ASHTON, AND EDRIDGE.

London, Jan. 2.

LIVERPOOL WOOL TRADE.

THE ANNUAL REPORT.

The result of the past year with regard to wool—next to cotton the most important staple for textile fabrics in this country—may be summarized thus: Domestic wools, in average supply, have somewhat receded in value. Fine colonial, with greatly increased arrivals, but materially decreased exports, have suffered a considerable decline; whilst low foreign, with diminished imports, and an abnormal demand consequent upon orders for army clothing, have ruled very steadily, and of late, in many instances, experienced some advance upon the rates current a twelvemonth ago. Whatever progress the wool trade in general may have made during the first five or six months towards recovering the activity of former years, the war between France and Prussia has certainly, for the remainder of the year, materially interfered with this as with most other branches of commerce; still it is matter for congratulation that the consumptive power of our home trade has been equal to absorb enough of the increased supplies of the raw material, to prevent a greater decline in prices of all fine colonial and River Plate wools than has actually taken place.

If we refer to the Board of Trade returns available for the eleven months ending 30th November, 1870, we find an increase of nearly 12 millions of pounds in the imports of colonial wools over those for the same period of 1869, but a decrease of nearly 3 millions of pounds in those of foreign wools. The exports of colonial have been about 16½ millions of pounds less, and those of domestic wools about 3½ millions of pounds less than in the preceding year, whilst those of foreign have been pretty much the same as in 1869. The quantity left for home consumption is consequently, in 1870, about 29 millions of pounds more than in the previous year. To this must be added wool pulled from imported sheepskins, chiefly from the River Plate district, the arrivals of which at this port alone have been 13,556 bales during the past year, or nearly double the quantity imported in 1869, although, strange to say, we find no record of sheepskins under the imports in the Board of Trade returns.

The declared value of the exports of woollen yarns and woollen manufactures of all kinds for the eleven months of 1870 amounts to £24,529,074, against £26,544,688 for the same period of 1869, or about 8 per cent. less.

Now, assuming the yield of the Home Clip for 1870 to have been equal to that of former years (which, according to a paper recently read before the Statistical Society in London, taken as an average of the four years 1867 to 1870, amounts in round figures to 160 million lbs.), and considering that stocks of the raw material in the hands of consumers and dealers are admittedly very light—only importers of fine colonial wools holding rather more than the usual quantity at this time of the year—it appears to us beyond all doubt that the consumption of wool during 1870 has been on an unprecedentedly large scale, that more machinery than ever is profitably employed, and that the woollen trade altogether is decidedly in a most healthy state.

AUSTRALIAN AND CAPE WOOLS.—The imports from these colonies during the year 1870, despite the generally anticipated decrease, have, with the exception of cape wools, exceeded those of any previous year, and the quantities offered at auction have been from

	Bales.	Bales.
Feb. 17th to 5th March...	81,768, of which	24,965 were Cape.
April 7th to 12th May ...	164,277	16,855 "
June 16th to 27th July...	235,134	26,207 "
Oct. 27th to 29th Nov....	174,825	48,493 "

In all656,004including111,520 Cape.

An impression existing amongst the leading importers of colonial wools that it would be more beneficial both to the grower and importer to hold auctions more frequently during the year than had hitherto been the case, a resolution was come to at the end of '69, altering the arrangement of four series in favour of five. This was carried out, it will be seen, so far as the first six months are concerned; but as the bulk

of the Australian wools arrives before July, it became evident that, in order to better equalize the remainder of the year, only one more series of auctions should take place. The outbreak of the war at this juncture between France and Prussia naturally exercised a depressing influence on all fine wools, and it was, therefore, on every account, the best action that could be taken in the matter.

The position of this article at the commencement of last year was generally regarded as dull, but the impression extensively prevailing amongst importers, though not generally shared by manufacturers, that the effects of unprofitable returns to squatters for some time past, and the consequent boiling down of stock, would result in an important diminution in the receipts, made many hope for higher prices in the February auctions. Though this was not realized on the opening day, a better feeling manifested itself as the series progressed, and an advance of 1d. per lb. all round was established on the first day's prices. At the second series the large quantity offered, and the uncertainty as to the ultimate result of the various clips, had the effect of keeping prices only firm at the rate established in March, but as they progressed an improvement of about 5 per cent. was realised on the better kinds of combing descriptions. This rise was scarcely maintained at the opening of the third series, and although Capes still ruled firm at late rates, the short attendance of foreigners resulted in competition ruling easier for Australians. Up to this point the course of prices, all circumstances taken into account, may be said to have been as satisfactory as could have been expected, and events had so far borne testimony to the welcome fact that our home trade was recovering from the shock of 1866, and was sounder than had been the case for some time. That it should since then have lost so much of the ground it had with difficulty recovered, the unhappy struggle which still desolates two important manufacturing nations must be assigned as a reason. The declaration of war on the continent on the 15th July had the immediate effect of causing a drop of about 2d. per lb. on almost all prices; and although the series was brought to a close a few days earlier than had been intended, with large withdrawals during the week, no appreciable rally was experienced.

The last series of auctions, which did not begin until nearly three months after the war broke out, fully experienced its unfortunate influence; and though the home trade purchased freely, the Belgian and German buyers operated at first with great caution; the very reduced prices which were accepted, and the decision come to by some of the chief importers to hold over about 50,000 bales to the coming February series strengthened the market, but notwithstanding a slight improvement, all classes of Australians may be said to have closed fully 10-15 per cent. lower than in May, 1869. This was the most depressed series of fine wools since 1847, and the extremely moderate prices have caused a natural reaction in stimulating consumption, and prices have rallied somewhat since then.

The accounts from the colonies report an increase in quantity of wool, but about a month later, in consequence of heavy floods; for the latter reason a large proportion of the wool is expected to be shipped washed. The termination of this cruel war, which it is to be hoped is not far distant, would certainly exercise a beneficial result on prices, but the desolation and restricted resources of France and Germany will, for some time to come, tend to keep prices down, and we can at the most only look for a gradual recovery.

RIVER PLATE WOOLS show a decrease of imports, both in the aggregate to Europe as well as to England, as will be seen from the subjoined particulars.

	1870.	1869.	1868.	1867.	1866.

BUENOS AYRES.—According to the latest reliable information from Buenos Ayres, the actual result of the clip for 1870 shows a deficit of 22,000 bales on that of last year, and that the export thence should, notwithstanding, be in excess of those for 1869, is probably to be accounted for by the fact that a certain proportion of the '69 clip was retained on the other side in consequence of the very depressed state of the European markets. From Monte Video we are yet without precise information, though the decrease will probably turn out to have been in still greater proportion. The immense quantities of fine wools which have been shipped to England during the past year from the Colonies, and the extremely moderate rates ruling for them during the greater part of the year, have had a correspondingly depressing effect on all River Plate fine wools. A considerable quantity of Buenos Ayres and Monte Video wool has been shipped from France to England for safety since the outbreak of the war, and this has further tended to depress prices, especially as the new clip must now shortly be arriving. Santiago and Cordova wools have been in very short supply as compared with former years, and have, in sympathy with other coarse or low wools, met with some inquiry, and a rise of about 1d. per lb., has been established since the corresponding period of last year.

EAST INDIAN AND PERSIAN.—The arrivals during the year of 1870 have been considerably short of those of the previous year, showing a decrease of 27 per cent., but this is chiefly to be attributed to the short supply from Kurrachee where there is a falling off of 57 per cent. The usual quarterly auctions at which these wools are sold, have taken place here as follows, from

	Bales.
January 25th to February 3rd	12,410
April 26th to April 29th	10,373
July 26th to July 28th	8,008
October 26th to November 3rd	18,175

Total..... 48,966

against 65,480 bales in 1869, 58,541 bales in 1868, and 68,893 bales in 1867.

The course of this article has, on the whole, been satisfactory; and though the improvement which has lately been so manifest is attributable to an unusual state of affairs, to wit, the war now raging on the continent, still the permanent benefit which has been derived, inasmuch as stocks of long accumulation in dealers' hands have been cleared out, will be very great. Prices have fluctuated a little throughout the year. The January auctions were looked forward to with some interest, as the excessively small quantity of new imports gave hope of a rise in prices, very depressed since November, 1869. All classes opened firm, and hardened as the series progressed. A slightly easier tone was manifest at the second series, in consequence of the approach of the new clip of domestic, but values only declined on an average 0½d. per lb. The remaining two series occurring after the outbreak of the war, the effect was at once felt on all low wools, and East Indies participated in the general improvement, being specially adapted to the manufacture of army blankets.

PORTUGAL AND SPANISH FRONTIER WOOL, of which stocks were to a fair extent at the commencement of the year, show a remarkable decrease in arrivals, viz., about 30 per cent. less than in 1869, and the sales made throughout the year leave us almost quite bare of stocks. The clothing descriptions were much neglected until brought into play, through the army orders given out soon after the commencement of war on the continent, and prices have since stiffened slightly. Oporto combing fleeces well maintained their value of about 12d. per lb. until July and August, when in sympathy with ordinary English wools the demand had so fallen off that as low as 10½d. had to be accepted to make sales; but they soon regained this decline, and have gradually risen to 12½d. per lb.; the lower qualities have throughout met with a steady demand, and are now rather dearer than twelve months ago.

PERUVIAN WOOLS.—The inquiry for this class up to the month of September was only dragging, but since that period, in consequence of the contracts for military cloths, &c., a large business has been done at enhanced rates; the sales have included 55,000 ballots, as well as some hundreds of ballots out of speculators' hands, leaving the market all but cleared. Lima wools, though prices, in sympathy with those for Peru-

vians, have lately experienced an advance, the low rates ruling for colonial wools with which this class comes into competition, have naturally prevented it being to the same extent.

RUSSIAN WOOLS, as usual, have not been sent to this port, and stocks in London, &c., are at present exceptionally light. The home trade has not on the whole shown a very active inquiry for this class until within the last few months, but as the bulk of the production has again been taken direct for the United States, little or nothing remains unsold of this season's fair combing Black Sea wools. The present value is about the same as last January, having receded gradually at first about 5 per cent., which decline has been fully regained.

EGYPTIAN AND MEDITERRANEAN WOOLS have not arrived to the same extent as in 1869; of the former, a large proportion has been low skin wool, which, as well as fleece, have moved off at prices fairly in proportion to the value of English and common foreign descriptions lately, of course, participating in the general rise on all low wools suitable for army purposes, and very little remains unsold. Not much good Turkey fleece has come to hand, and the best parcels have been taken for America in the second half of the year, at about 11d. per lb. or a prime article.

BARBARY WOOLS show a decrease of import, only 4,263 bales having arrived at this port. Consumers have shown no desire to use this class, though a useful one, at the prices asked for unwashed, which were much above their comparative value, and yet promised at no time during the year a profit to importers; stocks remain, therefore, considerable. Good selected washed wools have, however, met with fair inquiry, and little, if any, remain in first hands, the value having ruled a shade higher than at the close of 1869.

IRELAND WOOL has closely followed the course of the domestic wool market, a quiet demand having taken off all the arrivals, only very slightly exceeding those of last year, and the value of good lots is somewhat higher than it was a year ago.

The imports of **MOHAIR** show a remarkable falling off—about one-half—compared with the preceding year; but, chiefly on account of the unfortunate state of affairs on the continent, a good deal remains in importers' hands. As no old stocks of fair average existed at the commencement of the year, the season's purchases opened briskly, and large contracts to arrive raised the value to 4s. 1d. per lb., but for the last six months almost no transactions can be recorded, a couple of hundred bales at 3s. 3d. per lb.—the price which would now be accepted by holders—embracing the bulk of the business done.

ALPACA has come to this port to the extent of 27,572 ballots, and stocks at the commencement of January, 1870, amounted to about 18,500 ballots, but, with the exception of the months of July and August, when the state of affairs generally was the gloomiest, sales to a fair extent were made every month, and stocks at present are only about 5,000 ballots. Prices made at the beginning of the year were 2s. to 2s. 4d., and the best classes reached their highest point in June and July, when 2s. 9d. and 2s. 8d. were paid for Arequipa wool. In September 2s. 7d. was paid for Arequipa quality, and last sales were 2s. 8d., but 2s. 8½d. has since been offered and refused, whilst Tacna qualities realized 2s. 5½d.

DOMESTIC WOOLS.—During the first few months of the year, the same sluggish demand which prevailed at the close of 1869 continued to be the chief characteristic of the English wool markets, and by the end of March a decline of about 1d. per lb. on December rates was to be noticed. There was a recovery at clip time, and it was a noteworthy fact prices stood identically at the same point as at the corresponding date of 1869, but this advance was again soon lost, and by the end of June a drop of 5 per cent. had occurred upon the opening prices at the country fairs. The panic which ensued at the declaration of war between France and Prussia, on the 15th July, had the immediate effect of causing a decline of 2d. per lb. on most descriptions, good lustre sorts suffering least; but as the first shock subsided, the ground lost was soon regained. All through the autumn months a steady inquiry for home consumption has occasioned a slow but gradual advance on both combing and clothing descriptions, and we close the year with an average depreciation in value, as compared with corresponding date of last year, of barely 1d. per lb.

SHEEPSKINS from the River Plate have been in large sup-

ply during the past year, the quantity imported direct, together with parcels transferred from France to this port, exceeding those of last year by 95 per cent. With the exception of the imports of the early portion of the year, the selection has been exceedingly poor, being, in some measure, the rejections of American buyers for the States. The demand, however, has been steady, notwithstanding the large increase in supply, and this has also been aided by the export inquiry till October for the States for anything at all good. The continuing increased favour which the pulled wools receive in this country, leave no doubt as to the outlet for any importations, but prices will always be regulated by those current for colonial wool, with which the wool off the skins comes into competition.

Liverpool, Jan. 7, 1871. R. W. RONALD AND SONS.

REVIEW OF THE CHEESE MARKETS FOR 1870.

The beginning of last year was marked by some improvement in the demand for American cheese, and 74s. was realised for choice qualities. For a short time there was also rather more inquiry for Cheshire, but in the course of a month trade became dull, and stocks began to accumulate. As spring approached, however, the quantity of English cheese had much decreased and very little of a moderate-priced sort was left in the market. Fine American were also getting into a small compass, 75s. to 76s. being obtainable for the very best. The trade then became (for a time) quiet for all descriptions. Fine American continued scarce, but West country and other sorts were comparatively plentiful. The market again resumed a more cheerful tone for a brief period; and towards the middle of May English cheese was taken more freely at moderate rates, American becoming more scarce, with prices ranging from 78s. to 80s. In the course of another month the weather became warm and dry, cheese went out of condition, buyers were naturally cautious, and trade, from a variety of causes, was very dull. New cheese of common descriptions was plentiful towards the end of June, but the partial failure of the hay harvest limited the usual demand in the country districts. Old Cheshire was in good supply, and new American came in freely, much of it poor in quality. As the summer progressed considerable disappointment was experienced in the sale of old Cheshire, principally owing to the extreme heat of the weather. There was a continuance of drought in the western counties of England, but in Cheshire there were occasional rains, giving promise of a fair make in that district. Autumn having fairly set in, there was a slightly better demand during the time of wheat harvest, and with increased supplies there was altogether a better trade. Extensive sales of Dutch cheese for French account, then stimulated a general inquiry, under the impression that other sorts might also be wanted for the same destination. The market was good, and American brought 66s. to 68s. The stocks of this description, however, becoming larger, and the flavour generally being strong (owing to the hot weather in which the cheese were made), prices declined, except for choice and clean-flavoured dairies. Towards the end of October American somewhat improved in price, though supplies were pretty good, and rates advanced to 72s. for the best. A demand for France being then anticipated, and which was ultimately realised, the market was cleared of a large quantity of medium descriptions of American. This had an effect on English cheese, and large purchases were made of the lower priced sorts. Really fine American, being rather scarce, were freely taken for Christmas trade as we came near to that season, and high rates were also realised for both Cheshire and Cheddar cheese of first-rate quality. Scotch and Swedish cheese have sold very well throughout the year at moderate rates. Medium qualities of Cheshire cheese are now in fair, but not large, stock at 60s. to 65s. Fine lumps are saleable at 68s. to 72s., and really fine full-sized at 78s. to 84s. The finest American are held firmly; prices to-day 74s. to 76s., medium qualities 60s. to 66s. Considering the dry weather which generally prevailed during the greater part of the summer and autumn we cannot anticipate a liberal supply of cheese, nor do we, as yet, look for lower prices. The prohibition of the export of butter from France may also exercise some influence on the price of cheese. The imports of American cheese for 1870 amount to 1,082,878 boxes against 881,307 boxes in 1869, showing an increase of 201,571 boxes.—CORDEROY AND CO., Tooley Street, Jan. 2.

THE EDINBURGH FAT CATTLE SHOW.

The fourth annual show of the Edinburgh Christmas Club is said to be the most successful exhibition which has yet been held under the auspices of the Club. The president is the Duke of Buccleuch, and the vice-presidents are the Marquis of Tweeddale, the Earl of Southesk, Lord Kinnaird, and Sir William Stirling Maxwell, Bart.; while the committee consists of some of the most eminent agriculturists in Scotland.

PRIZE LIST.

CATTLE.

SHORTHORNS.

Oxen, not exceeding three years.—First prize, G. Mills, Horsburgh Castle; second, T. Knowles, Newmarket, Aberdeen.

Oxen, exceeding three years.—First prize, W. Drysdale, Kilrie, Kinghorn; second, T. Elliot, Hindhope, Jedburgh. Commended, W. Ritchie, Spott, Dunbar.

POLLED.

Polled Angus, Galloway, or Aberdeen oxen, not exceeding four years.—First prize, 5 ga. cup, J. and W. Martin, Aberdeen; second, W. Drysdale. Commended, R. H. Harris, Earnhill, Forres.

CROSSES.

Oxen, not exceeding three years old.—First prize, J. and W. Martin; second, A. Cowie, Crombly Bank, Ellon. Highly commended, W. Scott, Glendronach, Huntly.

Oxen, exceeding three years.—First prize, Mr. Swan's 230 cup, Mr. Hardon's 5 ga. cup, and Mr. Club's 5 ga. cup, G. Shand, Ordans, Boyndie, Banff; second, J. Wallace, Banbath, Leven. Highly commended, J. and W. Martin. Commended, W. Drysdale.

HIGHLANDS.

Oxen, age considered.—First prize, C. Lyall, Old Montrose, Montrose; second, Trustees of the late Jas. Dalgleish, Ardnamurchan. Highly commended, W. Drysdale. Commended, G. Stirling, Home Drummond.

Heifers, exceeding two but not over three years.—First prize, W. Drysdale; second, J. and W. Martin. Highly commended, P. Beattie, Dunnydeer, Inch. Commended, J. Fergusson, East Grange, Forres.

Heifers, exceeding three years.—First prize, D. Ainslie, Costerton, Blackshiels; second, J. Allan, Billiemains, Ayton. Commended, The Duke of Buccleuch.

Cows, pure or cross-bred.—First and second prizes, W. McCombie, M.P., Tillyfour. Highly commended, J. and W. Martin.

DAIRY COWS.

Shorthorn, or any cross.—First prize, J. Niven, Huntly-street, Edinburgh; second, W. Colthart, India-place, Edinburgh; third, W. Cooper, Broughton-street, Edinburgh.

Ayrshire.—First prize, J. Law, Lothian Burn, Edinburgh; second and third, P. Ogg, Rose-street, Edinburgh.

SHEEP.

Cheviots, under twenty-three months.—First and second prizes, J. H. Durie, Barney mains, Haddington. Commended, J. McGill, Rotchell, Dumfries.

Cheviots, above twenty-three months.—First prize, T. Elliott, Hindhope, Jedburgh; second, W. Sanderson, Blyth Bank, Corstorphine. Commended: J. McGill, Rotchell, Dumfries.

Blackfaced.—First prize, Lord Crawford, Dunecht; second, Lord Strathmore, Glaimis Castle. Highly commended, A. Middleton, Kittybrewster, Aberdeen. Commended, C. Macpherson Campbell, Ballimore House, Tigh-na-bruaich.

CROSSES.

First cross out of Scotch blackfaced ewes.—First prize, T. Biggar, Chapelton, Dalbeattie; second, J. Allan, Billiemains, Ayton.

Any other cross, under twenty-three months.—First prize, G. Rutherford, Printonan, Coldstream; second, J. Skirving, Luffness Mains. Highly commended, R. Haldane, Fairdale, Selkirk.

EXTRA STOCK.

Pen of sheep.—Commended, L. Dalgleish, West Grange, Culroos; Trustees of the late J. Dalgleish of Ardnamurchan.

Pigs, not exceeding twelve months.—First prize, A. Leslie, Morningside; second, J. H. Dickson, Saughton Mains.

Pigs, exceeding twelve months.—First prize, A. Leslie; second, J. L. Gow, Raith.

Pigs, over eighteen months.—First and second prizes, A. Leslie; third, J. H. Dickson.

A TENANT-RIGHT STORY.

At the dinner of the Mortimer's Cross Agricultural Improvement Society Mr. C. NOTT said he was very pleased to hear the remarks of the Chairman, as also those by Mr. Bach, with regard to the rabbit question. Twelve months ago that question was a household word. Go into whatever company one would it was certain to be brought forward. It was at Leintwardine, he believed, that the subject was first broached. He trusted that nothing was then said to give offence; but the landed proprietors were there appealed to to take this great rabbit grievance into consideration, and he was proud to be able to announce that those gentlemen had been pleased to give their favourable consideration to the matter, and, as a consequence, there was now a better feeling existing in that part of the country. He had held conversation with several gentlemen who were present at the meeting referred to, and they had told him that a great and marked change for the better had taken place during the past seven or eight months, as they might now go out every night without seeing a single rabbit, where before they might have been seen in thousands. And if the landed proprietors thus granted their requests and met them thus straightforwardly, he thought it behoved the farmers to act, on their part, in like manner. He knew it for a fact that there were fields of turnips now to be seen both in Salop and Herefordshire second to none, which twelve months ago were almost completely destroyed by those vermin, the rabbits. If proof of this were needed, he might mention that one gentleman, a member of the Brampton Brian Society, had this year been so fortunate as to carry off a silver cup, value five guineas, for the best crop; and this proved what he had said, that if the landlord would give them the rabbits—the vermin, as he called them—the tenants would be able to farm right up to the cover-side. By the change which had been brought about the farmers were in a measure satisfied; but there were certain gentlemen who had not yet given the matter their consideration as they ought to have done, though he hoped they would follow the example which had been set them by those proprietors to whom he had alluded, and that speedily. With regard to the question of Tenant Right he held that that was a question which they were perfectly justified in bringing forward on an occasion like the present. They were justified in asking for this, and that the request was deserving of the attention of the landed proprietors. Some of those gentlemen knew something about farming; others knew nothing of it. For his own part he could wish that all were thoroughly practical farmers, as then they would know when they had got a good tenant. But it was useless to stand up there and talk of their grievances unless they could give facts, and he begged to instance one which was undeniable, and he did so fearless of contradiction. He knew a young man who, some six years ago, entered upon a farm. The farm was in a very bad state of cultivation when he took to it: in fact, he had had it described by one of the family as a wilderness, and as being in a very filthy state. Moreover, it had been very much neglected, but the young man to whom he referred, being a spirited young fellow, and belonging to a family renowned as amongst the best agriculturists in the Midland Counties, spent his money upon that farm, and after some five or six years' occupation brought it into a creditable state of cultivation; having done this he naturally thought that the tables would begin to turn, and looked to reap a tolerably good return for his outlay, and only last year expended something like £300 in artificial manures and artificial food for his stock; when lo! to his great surprise, after what he had done, he received six months' notice to quit! Greatly astonished, he went to his landlord and asked him whether he really meant the notice to stand, and whether he was tired of him as a tenant. The landlord said "No," but that the farm was in a good state of cultivation, and that he wanted to realize! "Well, sir," said the tenant, "I hope you will make me some compensation, for I have been at great expense, and I cannot afford to sacrifice what I have laid out on the land." "Oh," replied the landlord, his liberality and sense of justice showing itself, "that is another question; that was your own look out!" (Shame). He (the speaker) did not see that it was that young man's own look out, and he did not think that that was the way he should have been treated. However, he had to go, and he went, leaving behind him £300 of unsecured property on the farm.

The landlord was now about to "realize," and at whose expense? Why, at the expense of the tenant! (Shame). Were they right, then, or wrong, in asking for a Tenant-Right? The young man he referred to was thrown upon the world. He had character it was true; but how was he to regain the property which he had left behind him? He threw this in the teeth of landed proprietors who would condescend so to act to their tenants, and he was sure the meeting would agree with him that they were justified, when these things were taking place, in asking for the protection of a tenant-right.

WHAT THE TENANTS WANT.—Tenant-farmers know whether their rents have been increased during the last twenty years, and how often. We know one estate which has been twice re-surveyed to meet the extravagance of a member of the family, and after each survey the tenants have been informed that the value of their estates was increased, and they were invited to offer higher rents than they were previously paying, and most of them did so. We don't intend to say that there was anything wrong in these re-valuations, nor in the increase of rent, but they show that the increase of value goes into the landlord's pocket, and that while this growth in value is so constant as it is, the tenant-farmers may ask themselves what concern they have in helping the landlord to sling his lawful burthens off, and charge the State with tyranny in adding a small increase to his rates while he gets so large an increase in rent. What tenants want is justice from landlords in the form of security for their capital where they are tenants at will.—*The Western Times.*

THE TAXATION OF FARM HORSES.—At the Preston Epiphany Quarter Sessions, Mr. Wilson, officer of Excise, appealed, on behalf of the Commissioners of Inland Revenue, against the decision of Mr. Heelis and others, justices of Burnley, who, on the 31st of October last, excused Mr. James Hartley, farmer, of that place, from the payment of an assessed tax of 10s. 6d., upon a horse used by him. Messrs. Cobbett and Gorst, instructed by Mr. Twelley, clerk to the Inland Revenue of London, were counsel for the appellant; and Mr. John Addison was for the respondent. Mr. Cobbett stated that the respondent farmed 156 acres of land, and kept 50 cows and three horses. Besides the carrying on the ordinary business of a farmer, he employed a horse for the retailing of milk in Burnley, and the question was whether he was not bound to take out a licence for that horse, and pay the duty of 10s. 6d., the animal not being employed in husbandry. Mr. Addison said the milk was not hawked from door to door, but was simply delivered to the respondent's regular customers, and he argued that to dispose of the produce of the land, the milk in the manner he described, was just as much a part of husbandry as the actual tilling of the land. He was not carrying on the business of a dairyman, but was simply getting rid of his produce as a farmer, just as another might send his carrots or turnips to market. The milk was just as much the produce of the land as those products would be, and the horse was therefore employed in husbandry. He handed up two or three law reports to show that the judges in the superior courts had taken this view of the case. Mr. Gorst knew that the farmers in Harrow sent their milk to London, where horses were employed in retailing it, and those horses were taxed. If the respondent had sent his milk to Burnley in the gross, the horses carrying it would not then be taxed, but if he chose to retail it himself, then he was liable to the tax. The chairman (Mr. T. B. Addison) said it appeared to the Bench that the selling of the milk was part of the respondent's business as a husbandman. Therefore they agreed with the justices below, that the horse must be exempt from the tax. Mr. Cobbett asked for a case for the Court of Exchequer. It was a case in which the Crown was very much interested, because there were other parties who had paid the tax under similar circumstances. Mr. J. Addison: They won't get their money back from the Crown, we may be sure (laughter). He opposed the application, because he understood that his application for costs would be useless, the Court having no power to grant them, and if the respondent had to fight the case in the Court of Exchequer he would have to bear all his own expenses. The Chairman said he did not think there was any case for the Court of Exchequer to decide.

THE MIDLAND FARMERS' CLUB.

THE GAME LAWS.

At a special meeting of the Midland Farmers' Club, in Birmingham, Mr. W. Brewster in the chair—

Mr. F. ALLEYNE MCGEACHY said he took it for granted that the members of the Midland Farmers' Club must, of necessity, take a deep interest in the Game Laws. If he were to use the words which O'Connell was accustomed to address to his adherents in Ireland, "You must exert yourselves, if you are to be freed" from what many persons considered the great curse of game, it would seem almost indecorous on his part, and might be resented on theirs as a piece of advice he had no occasion or right to give. Yet every one who had paid much attention to the Game Law question, affecting, as it did, primarily the tenant, and virtually the whole nation, had constantly brought painfully before him the fact that in talking privately to a farmer he heard bitter complaints of the Game Laws, whereas a very poor response was probably given to his own denunciation of those laws when he met the same gentleman in public. It was constantly thrown in the teeth of gentlemen who were trying to remove what they thought to be the great evils which affected this country at the present moment, that they were trying to help those who apparently had no wish to be helped. Great hopes were entertained by himself and many other persons that, considering the point at which the interest on this question had arrived, there would have been during the past autumn further discussions upon the Game Laws, more particularly at the agricultural dinners held in various parts of the kingdom. At most of these dinners, however, comparatively few remarks were made on the subject, it being always stated that political questions were to be excluded; but those persons who found the Game Laws an inconvenient subject, as time goes on, must be pleased to remember that they themselves were the cause of the question taking such an advanced place in politics. At the meeting of the Club which he had the honour of attending in the spring, Mr. Lowe said he had been looking in vain for some argument upon the subject. Of course, if one could carry the public objects he had in view by logic and argument it would be an admirable thing; but if practical men could carry their object by what some thought to be neither logic nor argument, it would not make much difference. The progress of the Game Law reform had been very considerable during the past year, and it often seemed to be supposed that the agitation, as it was now called, about this question, was an entirely new thing, which might be very well left alone. Looking back at the effect of the Game Laws, it was clear that for some years past the country had not been content with those laws. Fifty years ago the same impatience was felt as now with reference to the Game Laws. For instance, towards the end of the French war, when it might be supposed that everything would be done to put the country in the best position for carrying on a foreign war to the greatest advantage by maintaining perfect peace and goodwill amongst the people, the statutes for preserving game were many and various, and not a little obscure and intricate, it being remarked that in one statute (5 Anne, c. 14) there was false grammar in no fewer than six places, besides other mistakes, the occasion of which, or what denomination of persons were probably the penners of those statutes, it was unnecessary to inquire. It might be generally sufficient to observe that the qualifications for killing game, as they were usually called, or more properly the exemptions from the penalties inflicted by the statute-law were—first, the having a freehold estate of £100 per annum, there being fifty times the property required to enable a man to kill a partridge as to vote for a knight of the shire. This was in the agony of the French war, when knights of the shire were running up the national debt to £800,000,000. Forty shilling freeholders voted for them, but a man required to be a £100 freeholder to dare to touch a partridge. For unqualified persons transgressing those laws by killing game, keeping engines for that purpose, or even having game in their custody, or for persons, however qualified,

who killed game, or had it in their possession at unreasonable times of the year, or unreasonable times of the day or night, on Sundays, or Christmas Day—and it was wonderful to see the religious element running in those laws before the repeal of the Tests and Corporations Act—there were various penalties assigned, corporal and pecuniary, by different statutes, on any one of which, but only on one at a time, the Justice might convict in a summary way; or in most of them prosecutions might be carried on at the Assizes, when it was worth remarking that, positively going back in respect to those vile laws, the old English squire was, at any rate, a gentleman who—though he was full of his own importance, as well he might be when he was able to lay 800 millions of debt on the country—did all he could to catch a poacher, and when caught, gave him a belly-full—all that he could. But he had a respect for himself. He knew nothing of accumulative penalties; he knew nothing of the vindictive vulgarity—if he might be allowed the expression—of the modern game preserver. He might be a brand-new peer, or a retired tradesman, or a financial agent who set to work to make a deer forest, he might have a notorious poacher for a game-keeper, who had his enemy tried upon two or three charges, and sentenced to two or three punishments; and going beyond the point at which English love of fair play would lead him to stop, by himself or his agent, took care that the Board of Inland Revenue should be compelled to proceed against the man for shooting without a licence. The magistrates, who were often indisposed to act, were then compelled to inflict desperately heavy penalties, which they had only power to reduce within certain limits, those limits leaving a heavy item remaining. When it was remembered that there were between 10,000 and 11,000 convictions a year, everything had clearly been done in the way of security, and, as a matter of common sense, it was time to change the existing system. Referring to a recent meeting of the Hertfordshire Chamber, he would quote the remarks of Mr. Cowper, the senior member for the county, who treated the subject in a great degree as a landlord and tenant's question. Though he avowed the evils of the present state of things, yet Mr. Cowper thought the Legislature should not act, and there appeared to be a great objection to the Legislature interfering in this question on the part of many gentlemen who saw no objection to interfering, for example, with the management of factories. Mr. Cowper further said, "he could not find words enough to condemn the landlord who let his tenants be overrun by ground game; if it was without compensation it amounted to a fraud." And if looked at fairly and dispassionately it was difficult to find a greater fraud in a moral, if not a legal sense, by persons using their powers so unjustly. Mr. Cowper added, "he was perfectly ready to consent to any measure which should give the tenant control over the ground game." That was, no doubt, very kind, but the real question was, Why was that never done before? After moralising on the matter Mr. Cowper further said the subject was one which in hands of ordinary capacity might be made dangerous; therefore, when the cloud, now of the size of a man's hand, became bigger, and when the people were determined to do away with the Game Laws, he advised the landlords, on no account to enter into a contest with them on the subject; but to let those laws go, and to retain as much of their political power as they could. He (Mr. McGeachy) believed the Game Laws were going, and would go, however much of political power might remain to the landowner. That must rest, under the new franchise, with the people of this country. Mr. Smith, the next member for Hertfordshire, said, at the same meeting, "they were one and all going to give up hares and rabbits"—a result which was, in a great measure, attributable to the discussions which had taken place in the county on the subject. The third member, Mr. Brand, thought the arguments of the Game Law repealers very weak, and were so thrashed out that they had been obliged to attack the Prince of Wales with reference to the

stimulation of tastes, not essential parts of a royal education, is a young man upon whom the future of this country mainly depended. It was stated, apparently on authority, that at the present time there were 18,000 acres of unlet land in Norfolk, and it was surmised by persons who knew that part of the country that men would not undertake to cultivate those farms, believing that ruin stared them in the face if they attempted to deal with them. As to pigeon shooting, *The Times* said upon the matches at Hurlingham House: "We think it high time such senseless, such cruel, and such costly amusements should be put down, not, indeed, by the law, but, what is above all law, the instinctive feeling which all true Englishmen (that was a direct attack upon his Royal Highness), and all lovers of legitimate sport have against practices which are alike brutishing, ruinous, and debasing, and which are revolting at once to the humanity and to the common sense of the community." The Game Laws were said to be a "bastard slip of the forest law," and those pigeon-shooting matches were exactly a "bastard slip of the Game Laws." They were an ingenious arrangement by which there should be no lack of amusement when particular birds could not be shot. Was that an occupation for a young man, who was likely to succeed to a throne which had been filled by Elizabeth and Cromwell? Was it for the good of the country, was it in the sense of loyalty, that such amusements should be permitted in the highest quarters? *The Times* now stated that of all the public questions which had been recently agitated, the Game Laws were probably the easiest—that the circumstances of modern trade, and the habits of modern society, had made it a simple question of money; every landed proprietor having both a crop land and game-rent, and the question being one between the tenant and the landlord. Conversations with, and letters from many gentlemen, showed distinctly that whether or not it was a question of money, it had done more than anything else to destroy the peace, the comfort, and the happiness of the families of the great tenantry of England. The question of making game property, as suggested by Mr. Brand, had been suddenly put forward, and it was a question on which it was very often difficult to give a satisfactory answer. He did not wish, therefore, to speak about it, without taking the opinion of wiser persons than himself, and could not do better than read a few lines written by a person who had given his attention to the subject for thirty years. He said, "No human being, from the poacher down to the game preserver, can realise the idea that wild creatures, wandering where they will, can be made anybody's property. The first and essential incident of property, the moral assent of the community to its being held as such, is wanting. Parliament dare not pass a law for making the taking of game a felony; that being the result of a proposal to make it property, and that would soon be found if any such change were to be proposed. The law protecting game as property could only be enforced under exceptional circumstances; that is, where a witness who saw the wild creature taken on the land, the ownership or occupation of which is supposed to confer the right of property, could be produced. These creatures cannot be identified. Even in the case of domestic poultry stealing, comparatively few convictions are obtained from the difficulty of identification; and to identify the game animals is simply impossible." Lord Leigh had given up hares and rabbits to his tenants; Lord Cowper had stated that he would never, under any circumstances, let the shooting over his land to strangers. But, if he was rightly informed, Lord Lichfield, who took great interest in agriculture, had let the shooting on a large extent of his property over the heads of the tenants. (A Voice: "That's quite true.") A mansion formerly occupied by the family had been let to a gentleman who did not desire the shooting, and it was considered desirable by his Lordship to assert his manorial rights, by which the shooting had been taken from the tenants, greatly to their annoyance and let to another tenant. Though it might be said that that was an attack upon a landlord, he could only reply that it was a matter of public interest. He had believed it to be a fact, and, if so, they had in their own experience two noblemen, deservedly respected, who in the matter of game adopted plans irreconcilable the one with the other. At the Elford Petty Sessions a person was convicted of shooting a pheasant, on the testimony of a gamekeeper, notwithstanding its being proved by the evidence of three witnesses that the defendant

was elsewhere at the time the bird was shot. The Game Laws had been condemned right and left by men who had the interests of the people at heart, and what they said was, "Abolish those laws." If, however, it was said that the land would be trespassed upon, and that protection was needed, there was Parliament, which had passed a few hundreds of Acts in favour of the Game Laws, and would be ready to pass an Act against trespass; but he contended nothing of the kind was required. A special meeting of the Edinburgh Chamber of Agriculture would be held on the 25th of this month, when an attempt would be made to compromise the question, and to pledge the Chamber to promote an arrangement in Parliament, which would go the length of giving up hares and rabbits. An expression of opinion by this Club would have some weight in preventing what he thought to be a mischievous and illusive compromise. He would conclude by reading the words of a great Scotch farmer, Mr. Riddell, of Elundale, by Tedborough, who told the Scotch Chamber, five years ago, the real truth of this matter. He said: "I feel thoroughly satisfied that this Chamber should aim at nothing short of the abolition of the Game Laws. I have no objection to petition for the amelioration of the farmers' grievances, but I protest against the Chamber having anything in view less than the total and unconditional repeal of those laws. The curse of the Game Laws at present lies in their insidiously entering into the relations between landlord and tenant, embittering the very profession of agriculture, and tempting landlords to proceed from one extremity of harsh legislature to another at the expense and to the moral pain of the whole community."

Mr. G. WISE argued that the question was simply one between landlord and tenant. With regard to the permission which Lord Leigh had given to his tenants to kill hares and rabbits, he might tell them what he had heard. A friend, who had every opportunity of knowing, had told him that the result was this—that there were no hares or rabbits left.

Mr. ROWBOTHAM proposed the following resolution: "That the Game Laws are demoralizing to the working classes, are injurious to agriculture, are the fertile source of heart-burning and ill-feeling throughout the rural districts, and ought to be repealed." The tenant-farmers of this country were indebted to Mr. McGeachy for the able manner in which he was fighting their battle to get rid of these pernicious Game Laws—laws which he in common with others who had the real interest of the tenant-farmers (in particular), and the general interests of the whole community at heart, had long seen, must be abolished, wholly and absolutely struck out of the Statute Book. It was not for him to insult their understanding by going through the long catalogue of losses and grievances under which the tenant-farmers suffered, and who had been so many times explained, that he thought no one of common honesty would now attempt to deny them; and if it was admitted that the tenant-farmers suffered loss, then their loss was a loss to the nation, which cannot be measured by what they suffered only, because where a farmer suffered, there was at least in some instances a disposition shown by some landlords to meet the tenant's loss in the shape of a reduction of rent. But did this make things smooth as between landlord and tenant? That disposition was only shown in a minority of cases. Did that meet the requirements of the case? He said decidedly "No!" The whole community had an interest and a right to expect that land let out for agricultural purposes should be devoted to those purposes alone. They should not let the crops which ought to be for the subsistence of the people and the profit of the tenant (who had paid a fair equivalent in the shape of rent and taxes of all kinds for the privilege of growing them) be eaten up by vermin, as they are in many instances to the great loss of the whole community. Does not every novice know that on estates where game is preserved there is not half the food raised that there otherwise might be. He did not wish to be mistaken, and thought that he wished it to be understood that the game eats half the produce. But he would say that the fact of the reserving of the right to preserve game on a farm is a deterring influence that prevents that amount of skill and capital being employed in the cultivation of the soil which was necessary for the full development of producing what the land, without that clog, would be capable of doing, up to quite 50 per cent. of the produce, and the game eats a good deal of the half that is raised, so he was convinced that he was quite right.

in saying that the preservation of game was the country's loss, where it was preserved to such an extent as to eat one half of the food that man is entitled to by the laws of Providence—but which is overruled by the class-made laws of man. There were several reasons why they were told they ought not to interfere with these laws, viz., that by doing so they interfered with the rights of property; 2nd, they interfered with the liberty of the subject; and 3rd, that they would, if they abolished the Game Laws, drive the country gentleman from their estates. One writer in *The Field* referred to our field sports as a training ground for our officers for the Army and Navy, and named both Wellington and Nelson as men fond of field sports. Upon each of these four heads he would express his opinion in a very few words. As to the rights of property his idea was that there was not that absolute right in any kind of property that was claimed, and that a man could not do what he liked with his own to that degree which some claim to have the right to do. If he was the owner of that house, in which they now were, his will might be to set it on fire and burn it down—doing what he liked with his own—but by so doing he should injure the neighbours' houses. Therefore the law very wisely does not allow any such absolute right; then, why should he be at liberty to keep vermin on his estate, which he knew would trespass and do injury to his neighbours, who did not keep any. Ah! said they, but if they strayed their neighbour could catch them on his own land; but those who used that form of argument did but mock us, knowing as they did that it cannot be done, nor the depredations of their vermin estimated; and if they could be estimated, those who have made the laws say, "We are not bound to pay for damages done, because you cannot prove it was my rabbits, or hares, or what not, that did it." Their remedy was, that if they find them on their land, to kill them, which, he maintained, was the strong man mocking the weak and helpless. With respect to the liberty of the subject, did not all laws, more or less, interfere with the liberty of the subject? They must not steal; they must not burn their own houses; they must not have bull-baiting, cock-fighting, prize-fighting; they must not get drunk and riotous; they must not do a hundred different things that some people would do, but for the laws preventing them and interfering with the liberty of the subject. There was only one way that he could understand this logic, and that was—those who cry out against any interference with the liberty of the subject were the very men who enact the laws which do so interfere; and that when they speak of the liberty of the subject, they clearly wish them to understand that they were above the pale of the law. A notable instance was the laws against gaming. To toss for a pint of ale in a beer-shop was gaming punishable under the law; to "make a book" and keep open a list for betting at a public-house was gaming; but to bet at Tattersall's or other places where the law-makers mostly congregate, and bet so that a dukedom, a marquise, or an earldom eventually got into the Bankruptcy Court, was not gaming under the statute! or if it was, the game was too high to fly at, because by so doing it would interfere with the big fish who swallowed the minnows, and therefore an interference with the liberty of the subject. As to driving the country gentlemen from their estates, so many by their follies go into voluntary exile that I did hope that a large majority of those who were left had sense enough to find, to feel there were other enjoyments attending a residence in the country for a few weeks or even months, that if game preserving were given up to-morrow, they would not feel that all was lost! But if it did follow that because the Game Laws were repealed, the country gentlemen would not visit their estates, but go to reside in town, all I can say was, if they could only stay in the country at the enormous loss of one half of the produce of their estates being sacrificed for the sake of their presence, the sooner they betake themselves to the towns the better, for they would find they were the losers in the end, and the country at large the gainers. The writer in the *Field* speaking of the training the field sports gave to our young men as fitting them for officers to lead armies or navies, he quite ignores the fact that when the Wellingtons and Nelsons, and men of that stamp took their training, sporting was a different thing—as compared with the present practice. When they were young men, shooting was preceded by hunting the game, and not only was it necessary to be a skilful marksman,

but the finding of the game was an health-giving employment, the enjoyment of which the modern system was entirely destitute. If as was done now the standing still and blazing away by the hour, having your gun loaded for you, and the game driven to you, was the sort of training our Game Laws were to be kept up for, all he could hope for was that the enemies of England would be as tame as the pheasants were, or the training would be at fault, and the country submit to a great evil for a very small return. One word with respect to an observation made by our worthy chairman about this time last year, when enumerating the benefits that had resulted from the discussions which had taken place at this Club, and the moderate tone that had prevailed on all occasions, except, perhaps, when the Game Laws were discussed, when people got beyond their depth. But even that he excused by saying that people who were bitten by game were very much in the same position as those who were bitten by a dog in a rabid state, likely to go mad. He, being one of the privileged ones, could not feel it like those who had been bitten. He enjoyed privileges beyond the common herd of tenant-farmers. His landlady's agent allowed him the privilege of scaring the birds off his corn with a pistol, loaded with powder only, on the very reasonable condition of only being careful into whose hands he trusted even such a weapon as that. They saw, therefore, that he had not any cause to complain.

Mr. R. PULLEN (Shackerley) seconded the resolution.

Mr. J. LOWE said that he was sure no one could feel more disappointed and distressed than himself that there should be in this country any one who should feel at liberty to preserve game to excess. When game was over-preserved, it became an abomination. He must oppose the resolution. He should like to ask the proposer of it, and Mr. McGeachy in particular, what would be the result of the abolition of the Game-laws? If these laws were abolished on the morrow, it would not prevent the landed proprietor making such terms with the tenant with respect to the preservation of game as he thought fit. The landlord would be just as much at liberty to make terms with his tenants if there were no Game-laws—he could make any terms his tenants were foolish enough to accept. If the Game-laws were abolished, they must have a stringent law of trespass. Was it desirable—did Mr. McGeachy desire it—that the common poacher should have liberty to go into the country and shoot, and that, if interfered with, he should be able to say, "Sir, you must not interfere with the liberty of the subject. The Game-laws are abolished, and the game is as much mine as yours." This was a "liberty of the subject" which would be rather inconvenient. He believed that the whole question from Mr. McGeachy's standpoint had been greatly overrated, for the landlords who over-preserved game were comparatively few. ("Oh, oh!" and a voice "Their name is legion.") He would repeat without any hesitation that, considering the number of landed proprietors, those who were over-preservers of game were comparatively few (No, no). Mr. Lowe then attributed the improvement which had taken place during the past twelve months, many landlords having made concessions to their tenants, or to the influence of opinion, which had been so generally expressed in the discussions which had taken place. He believed that, if they would only give it time, public opinion would have due and proper effect upon those landlords who were now over-preservers of game. He was opposed, and ever should be, to any violent change in the constitution of the laws (Hear, hear, and laughter). It was only fair and reasonable to look at the alternative before they ventured to remove a law from the statute book. He saw no objection to the question being compromised. It was rather the habit of the Legislature of this country to settle great questions by compromise; and he believed the majority of tenant-farmers would be perfectly satisfied if they would take out of the Game Laws hares and rabbits. He thought if they got rid of the ground game they would get all they wanted. But at the bottom of this subject was the great question—the arrangement between landlord and tenant. If farmers would be so careless and improvident as to go and take farms, knowing that the landlords were over-preservers of game, he did not think that they had a right to come out at the end of the chapter and complain that they were ruined (No, no, and a voice "Mr. Lowe is not a farmer"). He thought the resolution of Mr. Rowbotham was not calculated to produce in the

mind of liberal landlords and contented tenants that sympathy and co-operation which it was desirable should prevail. He did not think it would have the effect of inducing stubborn landlords to make concessions to their tenants, and he had certainly not heard from Mr. McGeachy, or any previous speaker, any good argument why the Legislature should abolish the Game Laws.

Mr. MAY (Elford Park) said the great thing was for them to ascertain what was the effect of the laws as they existed, as these laws concerned themselves. The question before them was one of very great importance; but they ought not to look at it from a one-sided point of view. He regretted that the landlords of the country had not settled the question among themselves before this. He was surprised that they had not done so. He was sure that the tenant-farmers would have been very much pleased if they had taken the matter up and settled it. He was sure that none of them wished to deprive their fellow-men of sport, so long as the pursuit of it did not inflict injury upon others. The question was this: How to make the sport compatible with the other interests of the country. Speaking as a farmer, he thought if shooting over farms could be divested of the injurious effects it now had, it should be done. He had an intense hatred of hares and rabbits. He did not believe that any man could farm properly if there were many upon his land. Mr. May, after alluding to the fact that some candidates, who were over-preservers of game, on the hustings actually spoke about cheap food for the people, went on to speak of the prizes which were offered at agricultural shows for the best-cultivated farms. Mr. Massey had offered a prize at the Wolverhampton Show for the best-cultivated farm; but there was not a man who could have a good farm so long as it was overrun with hares and rabbits. It sometimes happened that the gentlemen who offered these prizes for the best-cultivated farms were over-preservers of game. He did not feel inclined to go the length of the resolution which had been proposed. He thought one more moderate would be better.

Mr. BROWN (Sandhills) said the strong feeling which had found vent at the meetings of the Club with reference to the over-preservation of game was undoubtedly strong evidence of the great evils which resulted from the present system. Mr. McGeachy had told them that many land-owners of this country, influenced by the discussions which had taken place upon this subject, had made concessions to their tenants. They had a noble landlord in Warwickshire, who had done a very gracious act to his tenantry, but he did not like his name to be brought before the public. He could not agree with Mr. Rowbotham's resolution. What would they gain by the abolition of the Game Laws? ("Let us try it.") Mr. McGeachy had said something about the landlords exercising their power unjustly, but if they removed the Game Laws, the power of the landlord would remain, and he would then, as now, be in a position to use it, justly or unjustly, as it might suit his taste. Now, he was sure that Mr. McGeachy would not say that every estate should be thrown open to trespass; and if they had a Trespass Law

to supersede the present Game Laws, the landlord, as he had pointed out, would still be able to make terms with his tenants, the same as at the present time. In speaking of this subject he had two sections to deal with. He had those extreme men who would sweep away the Game Laws on the one hand, and on the other those who stuck up entirely for the rights of property, and who said that any innovation with respect to these laws was an interference with their rights. Now, he stood between the two. His opinions were somewhat moderate; and he thought Mr. Lowe's views were more in accordance with his own than those which had been expressed by any of the previous speakers. It was not a question of money or rent. There was no reduction in rent which could fairly compensate a farmer for the destruction which took place upon a farm when it was over-run with game; and he should have no objection to an alteration, so far as to put hares and rabbits out of the pale of the law. He would invade the rights of property so far as this, that it should be illegal in any agreement to reserve the hares and rabbits, and that if such an agreement were made it should be null and void. He would propose the following amendment: "That whilst this Club disapproves of the total abolition of the Game Laws, it is most anxious to record its opinion that the over-preservation of game is a most serious national evil, and that the sooner hares and rabbits are struck out of the Game Laws the better."

Mr. ROBERT MASEY said he thought Mr. Rowbotham's resolution would be productive of much mischief. He did not think that they had much to fear from wing game, but he agreed with Mr. Brawn that it would be well if hares and rabbits were taken out of the Game Laws. Mr. May had said that Englishmen were particularly fond of sport. Now he thought that they would be doing wrong if they did anything which would lead to do away with sport in this country. They had seen the effects of absenteeism in Ireland, and they did not wish to see the same thing extended to England. He believed if such a resolution as that proposed by Mr. Rowbotham were passed by the Legislature, farmers would be more severely handled by some landlords than at present. There was another point connected with the subject they had under discussion, which had not yet been alluded to, viz., the rating of property. He had spoken with Mr. Read, M.P., upon this point. Let them suppose there were two farms of equal value. The one let at 45s. per acre, and the other only at 30s., because the landlord over-preserved the game. He had asked whether they ought not to take notice of the 15s. per acre in the rating of the property. It was clear from this that every ratepayer suffered in a degree from the over-preservation of game. He would second the amendment proposed by Mr. Brawn.

The CHAIRMAN said he thought it would be a great evil to totally abolish the Game Laws. He was more in favour of the amendment than the resolution.

The amendment and resolution were then put to the meeting, and the former was carried by a majority of eight.

A vote of thanks was passed to Mr. McGeachy.

HOW TO HIRE AND HOW TO LET A FARM.

HOW TO HIRE A FARM, AND HOW TO LET ONE. Well done, Mr. Mechi!—*rem acu tetigisti!* For say what we will, do what we will, 'tis to this it must all come. How to hire and How to let a farm, which being duly interpreted goes the further to signify how to *live* in one. We may talk about the breeding of stock, the growth of crops, the manufacture of produce, or the case of the labourer, as it seems the Farmers' Club proposes to do during the ensuing year; but the others must hinge more or less on this one leading question. We may grow busy over local taxation, we may wax warm against the same evil, we may protest against the iniquities of certain traders and dealers, and we may co-operate with the view of being served on better terms. But these are merely incidental matters, subjects rather of secondary con-

sideration to that great starting-point in the race for existence, that first shot to be fired in the battle of life.

It is somewhat significant that Mr. Mechi puts the lower power in the foremost place. He speaks in the first instance of How to hire a farm, as indeed his text-word might fairly enough have stopped here. But, no doubt, he is especially desirous of reading the landlords a lesson, and so he goes on to show how they should let their land. Were not undue competition the awkward fact, it would appear on the face of it that what was good for the one was good for the other; but with the power almost altogether in his own hands the owner is too apt to dictate terms, which are not mutually advantageous, or to adhere to customs and covenants which have become practically obsolete. An ignorant or indifferent agent

is too often the drag-chain to any advancement, as he should be the shuttlecock of Mr. Mechi's May-day address. They should knock him about from one side to the other, alike disowned and sent flying by landlord and tenant.

How to hire a farm is at this very moment the great question before the country. The Tenant-Right principle is gathering strength in all directions, and yet it is curious to see how little in certain parts it seems to be understood. At a meeting in Oxfordshire only a day or two since, it was attempted to confine the claim chiefly to an allowance for oil-cake! At a meeting down in Devonshire any proposal to extend the system was opposed on the plea that its main feature was to lock up the fresh-comer's capital in payments for tillages and such like acts of husbandry! while "A Landlord," in Herefordshire, argues that Tenant-Right is in so many words Landlord's Wrong, and that out of it the farmer is enabled to ride a good horse, to entertain his friends with a "prize turkey" at Christmas, and to listen to his daughters' performances upon the piano! And why not? Would this liberal landlord have it provided that a tenant should not enjoy himself and should not educate his children even as highly as a tradesman, a lawyer, or a clergyman might do? This, we take it, is not the way to let a farm, as this so-called landlord would not promise to be much of a landlord after all; for Mr. Duckham threatens to unearth him when he says, "if I am right, which I believe I am, let him henceforth proceed with his peaceful calling, and for ever after refrain from villifying his fellow-man." Can Mr. Duckham really mean to imply that a landlord who has for the last month or two been persistently sneering at the best farmers in Herefordshire is in reality a clergyman? And even if this be his peaceful calling, surely it is very wrong to say so; for, as Mr. Sewell Read tells us, it is only some extraordinary fellow at a market ordinary who ever has the bad taste to declaim against "too much priestly influence."

It is clear enough then that in common parlance Mr. Mechi has his work cut out for him. When he proceeds to show how a man is to hire a farm, he must at the outset let it be thoroughly understood whether his ideal hero is to live or merely to exist. Of course in these days a man must be up to his business, and possess capital, intelligence, knowledge, and so forth. And thus provided, is it right or wrong that he should have a good horse to ride, call for a bottle of good wine occasionally if he so choose, or educate his daughters even as highly as the curate's family? That good kindly man the Herefordshire landlord ridicules the notion of a tenant-farmer ever aspiring to such a position, while he calls permanent improvements and unexhausted improvements "a confused jumble" or "a new phrase in the agricultural world." If this man be a landlord we should not care to be his tenant, and if he be a clergyman "there are many useful lessons," to use his own affectionate form of speech, which he might still study to advantage. But Mr. Mechi has his work cut out for him.

How to hire a farm—Not by that unwholesome system of tender, which is extending in places, as a practice we hear not altogether unknown in an adjacent county to Hereford—Gloucester to wit. How to hire a farm—Not without a certainty of a man's own means being secured to him. How to hire a farm—Not without a right to the rabbits and a stiff clause against the over-preservation of game. How to hire a farm—Not without a proviso, which supposing things should go wrong, would put the other creditors on as good a footing as the landlord; but here of course the interference of Parliament will be required to revise that monstrous law of

distress for rent. How to hire a farm—Not without a thorough knowledge of all the rates and taxes, as of how much the rent will be raised in the event of any more equitable adjustment of local taxation. How to hire a farm—Not with other people's money; not to do landlord's duties in the way of building or draining, without being properly paid for so doing. How to hire a farm—Not with any understanding that you are to vote blue, yellow, or harlequin, as the landlord pleases, at election times. How and when to hire a farm—When the principle of Tenant-Right has become generally acknowledged, when the first claim for rent has been abolished, when letting land by tender has been made an offence punishable at common law, and when the occupier's "privilege" to destroy rabbits and such like vermin is placed beyond dispute. Mr. Mechi, verily, has his work cut out for him.

And, again, How to let land on such terms as will enable a man to live in a condition something superior to that of his own labourers. Nothing is so easy in these days as to get a great rent. Any sharp solicitor from Chancery Lane or smart land-agent from Piccadilly, would no doubt undertake to put up the rental of an estate in less than no time. The more needy the applicant is, the less in fact that he has to lose, the more careless will he be as to what he gives. But this is not the way to let a farm. On the contrary, with such a choice before him, the landlord or agent should take only a tenant with character and means; as it is then, with fair terms of letting, that the interests of the two become more and more identical. The next thing clearly for the landlord to learn is How to give way; to throw up the frowy old covenants which can only impede the action of an enterprising tenant; to study less the wishes of his game-keeper, and to let his land in the country to a farmer on the same businesslike terms he would a house in London to a tradesman. This subject, as it stands on the new card of the Farmers' Club, strikes the very key-note of our march onwards. If the art of Agriculture is still to develop as it should do, any improvement must begin at the very hiring of the land.

THE FARMERS' CLUB.—The following subjects have been selected for discussion during the year 1871. February 6: English Cheese Factories—how to Establish and how to Manage them; proposed by Mr. J. Coleman, Park Nook, Quorndon, Derby. March 6: The Supply of English Cavalry Horses; Mr. E. Tattersall, Albert Gate, Knightsbridge. April 3: The Growth of Cabbage, and kindred Crops; Mr. Clement Cadle, Gloucester. May 1: How to Hire and how to Let a Farm; Mr. J. J. Mechi, Tiptree Hall, Kelvedon. November 6: The Agricultural Labourer—his Employment, Wages, and Education; Mr. C. S. Read, M.P., Honingham-Thorpe, Norwich. December 4: Breeding—Facts and Principles, Mr. J. K. Fowler, Prebendal Farm, Aylesbury.

CAUTION TO JUDGES.—The following letter has been addressed to a local journal: I was an exhibitor of sheep at the fat stock show, held at Carmarthen, and was rewarded by the judges with a "high commendation." On the card was also written, "Want of quality—too fat." Now, sir, every one who was present knows that, without exception, my sheep were the best in the yard. If they had no quality or were too fat why commend them at all? Such inconsistent treatment as this is but poor encouragement for any one to go such a distance, and I now challenge any person in the county of Carmarthen to show (before competent judges) better fat yearling sheep either in quantity or quality. John Williams, Caerceddy, Welsh St. Donatt's.

THE FRENCH PEASANT'S SEED FUND.

The following letter has been addressed by Lord Vernon, as chairman, to noblemen and leading country gentlemen in their several districts:

I have the honour to submit for your consideration some particulars of the benevolent purpose which it is desired to carry out by means of the committee in whose name I now write.

The progress of the war on the Continent has left the peasant farmers in many districts of France without the means of cultivating or sowing their land. The approaching period of spring sowing is an opportunity which by prompt and vigorous action may be seized to avert the famine that otherwise seems inevitable; the Committee are therefore desirous of collecting donations in seeds and money for this purpose from those whose interest in land, whether as owners or occupiers, naturally induces sympathy with the French farmers in this emergency. It appears unnecessary for me to urge the magnitude of the wants of the French peasant-farmers, as the newspapers have made every one acquainted with the subject; but I may remind you that the tract of country which has been laid waste has been estimated at probably not less than one-fifth of the cultivated area of France.

Application has already been made to the French and German authorities, through their representatives in England, to assist the committee in carrying out the objects they have in view.

Any donations entrusted to the committee will be utilized in such manner and at such a period as will best ensure their proper application in those districts of France where seeds are required, and to which they can be transported with the greatest safety.

I earnestly hope that you will feel yourself at liberty not only to support the Committee in forwarding the object they desire to carry out, but to use your influence amongst those resident in your neighbourhood in making the operations of the Committee known as widely as possible.

I am, your obedient servant, VERNON, Chairman.

NEWCASTLE FARMERS' CLUB.

At the annual meeting, the SECRETARY, Mr. H. Stephenson, said that he had received a circular relating to the "French Peasants' Seed Fund," appealing for donations of seeds, to aid the distressed French peasants. He thought it was perhaps intended that the Club should form a committee to collect subscriptions.

Mr. W. BELL (Harlow Hill) said he thought that those who went to war ought to meet all expenses themselves.

Mr. B. BELL (Newcastle): Is the circular sent to the Club to get a donation, or only to get machinery put in motion to get subscriptions?

The SECRETARY said he thought it was desired that the Club should get machinery in motion to gather aid.

Mr. B. BELL said the subject was worthy of their attention, and already it had called forth much sympathy in other parts of the country. He moved that the committee of the Club be recommended to consider the matter.

Mr. J. SHIELD seconded the resolution, and it was agreed to.

Mr. JOHN GREGORY said that perhaps there never was a time when the action and principle of ploughs were so much discussed as at the present time, and every new method of treating the soil, whether done by steam or horse-power, was looked upon as of the highest importance. The work they now done, and which some called perfection, was only the cutting of a solid slice; and one of the disadvantageous features of modern ploughing, doing more harm than good, was the leaving the furrow without a crack, and glazing the face of the furrow, and so stopping the breathing pores of the soil, and almost making it to be in such a condition that the atmosphere had no effect upon it, which was the very thing to be avoided. He thought a farmers' club like this could not have a more important subject brought before it; and perhaps some practical farmer would read a paper before the members on the question whether a solid or broken furrow left the land in the best condition for cultivation, and a discussion could follow. Perhaps Mr. Little, of Chester-le-Street, would prepare a paper on the subject. I think he would, I spoke to him about it.

The SECRETARY stated that papers had been arranged to be read at the February and March meetings.

It was resolved that the Secretary write to Mr. Little requesting him to read a paper at the April meeting on the subject mentioned by Mr. Gregory.

The SECRETARY read the following report of the committee: We, as your committee, have now the pleasing duty of laying before you the annual report, which proves the Club to be in a very satisfactory condition. The following statement shows our present position as to members: Members on the books in December, 1869, 267: elected during the year, 12; deceased, and struck out as defaulters, 18; resigned, but paid for this year, 11; present actual number of members, 250. We do not feel discouraged by this falling-off in numbers, as, by the treasurer's statement, you will observe that the subscriptions have been larger than during the preceding year, which is to be accounted for by the fact that a considerable number of names have been allowed to remain on the books after the gentlemen ceased to pay their subscriptions, and during the year all such names have been written off. In March last, Mr. Henderson favoured us with a paper on "The Prevention and Cure of Quarter-ill in Cattle," which contained many useful and practical remarks: the paper was printed and circulated among the members. We are happy to be able to inform you that Mr. George Hedley has kindly consented to give us a short paper after dinner, to-day, and that arrangements have been made for the months of February and March, of which due notice will be given. As contemplated in last year's report, we have thoroughly revised the library, by replacing missing volumes which were thought necessary, and completing and re-binding several agricultural journals. We purpose issuing a new catalogue as soon as possible; and, by keeping the library well stocked with new books and journals, make it more attractive than hitherto.

At the dinner, Mr. G. H. RAMSAY, the chairman, said that the French consul had applied to him to assist the French with money, corn, &c. He replied that the Club would not be behindhand in alleviating the distress of the French people, but that the time had not yet arrived, though he hoped it would not be long before they were called upon to do something in the way of furnishing seed and other things. He was glad to say the Club was prosperous.

FARMERS' CLUBS AND CHAMBERS OF AGRICULTURE.—At the annual dinner of the Newbury Chamber of Agriculture, the chairman, Mr. Wentworth, said the committee had thought it advisable to change the name of the Club to that of the Newbury Chamber of Agriculture, the idea being that it should not be confined to farmers only, but should also include magistrates and gentlemen of the county. The balance-sheet was not, however, of a very satisfactory character, the expenses having somewhat exceeded the amount of subscriptions; but if each member would only introduce another the financial difficulty would be entirely obviated. The heaviest item was that of £10, the fee paid to their analytical chemist, Professor Sibson; but that gentleman's valuable services could not be well dispensed with; and as a proof of the manner in which that feature of the club had been appreciated, he mentioned that during the past year thirty-five samples had been sent for analysis.

Many of the Chambers seem to be perishing through inanition, and the Central itself has not too much to come and go upon. Indeed, the appeals made every now and again rather indicate that what is designated the head department has not enough of 'the sinews of war' to carry on the fight in favour of farmers. And the country chambers find that they cannot afford to pay for analyses, although the price for the twelvemonths is not more than a £10 note. There is something wrong somewhere. Either the Central has failed in its government, or members of the local societies do not recognize the value of union, and are not sincere in their expressions about the efficacy of combination to redress the grievances of which they complain. We have a notion of our own. There was an 'old man of the sea' who sat upon adventurous sailors; perhaps his representative still bestraddles pioneers who plough the fields instead of the waves?" Some short time since, the Hungerford Farmers'

Club, as its neighbour at Newbury now has done, adopted the title of a Chamber; and the Hungerford Chamber of Agriculture, according to the last report, would appear to be in a moribund condition, although it flourished for many years as a Farmers' Club.—*The Farmer*.

An announcement that the Warwickshire Chamber of Agriculture will on Tuesday next, at Rugby, discuss the important question of Local Taxation together with the report of the proceedings of the meeting of the Midland Farmers' Club, last Thursday, raises the question of the comparative importance of these two great agricultural associations. On this subject we are inclined to the opinion expressed by the

Gardener's Chronicle, quoted in our special agricultural column, that Farmers' Clubs are, as a rule, more practical and useful than the Chambers of Agriculture. We are confirmed in this belief by the fact that one of the most flourishing and useful Farmers' Clubs in the kingdom, held at Hungerford, were the old Bath road begins to skirt the broad and historic downlands, has ceased to be popular since it became a Chamber of Agriculture. The name and constitution of these so-called Chambers apes the Chambers of Commerce in our great towns and commercial centres. The very name, Farmers' Clubs, is essentially English. The Chamber of Agriculture is hardly so national in its origin or in its name.—*The Leamington Courier*.

THE ROYAL AGRICULTURAL SOCIETY'S MEETING AT WOLVERHAMPTON.

THE FARM PRIZES.

At Wolverhampton the Prizes Sub-Committee of the Local Committee of the Royal Agricultural Show and a number of agents of landowners, tenant-farmers, and others, met Mr. Jenkins, the secretary to the Royal Agricultural Society, to discuss the terms of the prizes for the best cultivated farms.

Mr. R. H. Masfen was called to the chair, and introduced Mr. Jenkins to the meeting.

Mr. JENKINS said that they would most of them be aware that the Society had issued an advertisement in conjunction with certain landholders of Staffordshire and Shropshire. They were to offer two prizes for the best and second best arable and dairy farms, they must be situated in Shropshire or Staffordshire, that being the condition upon which the subscriptions for the prizes has been made. That the farms must be within the two counties was a fixed point which it was not for that meeting to disturb. Another fixed point was, the two first prizes were to be £100 each, and the two second prizes £50 each. The second prizes of £50 were given by the Society, who also took upon themselves all the expenses connected with the judging the farms and giving the prizes, which would be considerable. These points being fixed, he was deputed by the Council of the Royal Agricultural Society to take the views of the meeting upon the other points, and report them to the Council. The first point was the minimum size of the farms in each case that would be admitted into competition. Next, the distinction between an arable and dairy farm, the fixing of the amount of entrance fees, so as to shut out competitors who had little chance of success, and to decide whether the competition should be restricted to tenant-farmers, and, if so, to define what constituted a tenant-farmer, and say whether any one whose farm was partly constituted of his own land should be admitted.

Mr. KEARY said that since he had entered the room he had heard that the competition should, in the opinion of some, be confined to a certain area around Wolverhampton, but such an area must cut off odd parts of counties, which would be very inconvenient. The prizes, however, had been given upon the understanding that there should be an open competition of farmers in the counties of Staffordshire and Shropshire.

Mr. JENKINS pointed out that some towns would not give sufficient area for the purpose.

The CHAIRMAN said he was anxious, without having any feeling in the matter himself, to lay before the meeting the complaints of the Cheshire people, that though their county formed part of the area of the show, and was that part of it where dairy farming was more especially cultivated, yet they were excluded from a competition in which prizes were offered for the best cultivated dairy farms. He was anxious to show their Cheshire friends that there was no desire there to behave unfairly towards them, and to prevent any subsequent ill-feeling. They who were acting at Wolverhampton had had nothing to do with the matter: they did not find any portion of the money for the prizes, £200 of which was found by noblemen and gentlemen of Staffordshire and Shropshire; and it had been said that they who found the money had a right to prescribe the way in which it should be distributed as prizes, but when it was remembered that £200 formed but twenty-five per cent. of the total cost of the farm prizes to the Society, the Cheshire people might reasonably complain that the

Shropshire and Staffordshire people were putting their hands into an exchequer from which they had no better right to draw than the men of Cheshire. He should be glad to learn that the decision confining the competition to the two counties was not a settled question. The Earl of Lichfield had told him that it was not; and Mr. Randall had expressed to him his surprise at the terms of the advertisement. Still, they agreed with the minutes of the Council of the Society, but it was difficult to understand how the Council ever came to such a conclusion.

Mr. KEARY said that the money was subscribed for the two chief prizes upon the understanding that they were to be competed for by farmers of Staffordshire and Shropshire only.

The CHAIRMAN said that that being so, the question came how they were to reconcile the people of Cheshire to such a decision, and persuade them that at a show held for a large district embracing several counties, such prizes should be restricted for competition to the farmers of two counties only.

Mr. JENKINS said that the district of the show embraced North Wales, and if all of it was admitted to competition the task of testing the relative merits of the competitors for these prizes would be impracticable. With regard to the objections of the Cheshire people the propositions as they now stood were agreed upon at a meeting of the Council preceding that at which the instructions for advertising them was given. The proceedings of that prior meeting were reported in all the agricultural papers, so that if the Cheshire people had had any desire to add Cheshire to the counties named, they had had ample time to make known their desire to the Council of the Society. The whole of the scheme originated in Shropshire, and it was at first intended that the competition should be confined to Shropshire, but as the show was to be held in Staffordshire, the Society felt that Staffordshire ought to be included.

The CHAIRMAN remarked that Mr. Jenkins's explanation altered the case very considerably; and as it appeared that the Cheshire people had had an opportunity of which they had not availed themselves of urging their claims before the executive of the Society, he did not see that anything more could be said for them. As regarded the proposition for confining the competition to a radius, Earl Dartmouth suggested that it should be a radius of sixteen miles round Stafford.

It was however pointed out that the radius would take the competition into Derbyshire, which was not in the district of the show. After much had been said about the area of the competition, and many suggestions made as to the division of the prizes, the attention of the meeting was recalled to the facts that these were fixed points, and that it had yet to consider those which it laid before them.

The meeting then proceeded to consider what should be the minimum size of an arable farm to be entered for competition, and in discussing this question the meeting once more travelled into the region of the fixed points in discussing a suggestion of Mr. Turner, that as a large number of the Staffordshire farms were composed of stiff lands, they would have no chance against the lighter soils, especially if the summer were wet, for, be the farmer ever so skilful, the very appearance of his farm would tell against him. Mr. Turner was reminded, on the other hand, that if the summer were dry the advantage would all be with the stiff and against the light soil. Still there was much

favour in the meeting towards something being done to counter-balance the advantage which the nature of his ground gave to the light soil cultivator; and when it was found that "the fixed points" would not permit of an alteration of the present prizes, it was suggested that an additional £50, which Mr. Keary said would be forthcoming, should be supplemented by the Society, and made a special prize for stiff land farms. This being, for good and sufficient reasons, urged as impracticable, it was suggested that the amount should be given at the discretion of the judges to a stiff clay farm; but eventually it was agreed the amount should lie entirely with the discretion of the judges, who the meeting were ultimately satisfied would be able to do justice to such farms without any special terms of competitions, two of the successful farms at Oxford having been stiff land farms. The minimum for arable farms was fixed at 200 acres; that of dairy farms at 150 acres with 30 cows, and cultivated for dairy purposes: with the understanding that the milk might be sold off the farm. The next point considered was that of the entrance fees, and the meeting agreed at once that those of the arable farms should be as at Oxford, three guineas for non-members and two guineas for members of the Society; but it was suggested that in the case of dairy farms the amount should be one guinea for members and two guineas for non-members. On the other hand it was contended that those for the dairy farms should be the same as those for the arable farms, and upon a division the latter proposition was carried. The meeting next decided that the competition should be confined to tenant farmers, and in answer to the question, "What is a tenant farmer?" Mr. May said he was one, who got his living principally by farming; and the Chairman added, amidst laughter, "Or wishes to do." Eventually, after considerable discussion, it was decided that the qualifications of the competitor should be that he rented under another person at least two-thirds of his land, and that he had occupied it for at least two years, and that where the farmer occupied more than one farm he should not be at liberty to enter any one of his farms, but should be required to enter all that were situated within the limits of the area of competition. It was also agreed that the entry should be made on or before the 25th of March. Mr. Jenkins explained that he should lay the recommendations of that meeting before the next meeting of the Council of the Royal Agricultural Society, which will take place on the 1st of February, and immediately after that the advertisements for the competition will be published. A long conversation ensued as to the points which the judges should take into consideration in deciding the comparative merits in the competing farms, but, with the exception of the addition that in judging the dairy farms they should take into special consideration the management of dairy produce, the directions given at the Oxford show were thought to be sufficient. With regard to a suggestion which the Chairman brought from outside, that the management of the dairy farms was in so many respects so different from that of the arable farms that a person well acquainted with the one would not be a competent judge of the other, and therefore that there should be two sets of judges, it was decided to leave the whole question of the appointment of judges with the Council, as so much depended upon the number of farms entered for competition and their situations.

The CHAIRMAN, on the conclusion of the business for which the meeting had been called, said that there were many gentlemen present from Shropshire, most of whom were representatives of noblemen and landed proprietors, and he had been requested by noblemen and gentlemen in Staffordshire to solicit them to use their influence with those for whom they acted, and with others in Shropshire, for subscriptions to the funds necessary for the carrying out of the show. He simply threw this out, by special request, as a suggestion to the Shropshire gentlemen present.

Mr. ASHDOWN said that the Shropshire gentlemen thought that the Staffordshire men were very fortunate in getting the show for their county, and that if the Shropshire men had got it for Shropshire they would only have been too glad to have defrayed all the expenses.

The CHAIRMAN: And we should only have been too glad to help you.

The proceedings terminated with a vote of thanks to the Chairman.

THE ROYAL AGRICULTURAL SOCIETY'S MEETING IN 1872.—As we prognosticated would be so, when it was first announced that the Royal Agricultural Society had fixed on a district including Herefordshire for their exhibition of 1872, there seems to be very little desire shown on the part of either City or County to enter the lists as competitors for the show. The struggles in which Hereford has been unsuccessful, once very undeservedly so, are not yet forgotten, and there is an evident aversion to again entering into a competition. The subject came before the Town Council at their meeting on Tuesday, but was conveniently got rid of by transferring its consideration to the Local Chamber of Agriculture. If anything is to be concluded from the expressions of the only farmer in the Corporation, there is in the agricultural mind of Herefordshire not only no desire to invite the Royal to Hereford, but a positive wish that it shall not be in the least assisted to visit the City of the Whites. This may be all very well; revenge, we are told, is sweet, but there is a sort of revenge which, if sweet, is very silly also; we mean that kind which cuts off its nose to spite its face. We shall look with some interest to the opinion to be expressed by the Chamber of Agriculture upon the matter; for it is pretty clear that if the same lethargic indifference be shown there as has been shown by the Aldermen and Councillors of Hereford, this city cannot be a bidder at the Royal Agricultural Society's next auction. The only town which is as yet preparing for the coming competition is Newport, where the matter has apparently been taken up with much energy and determination, a public meeting having been held there on Thursday, at which no less than £1,500 was subscribed towards expenses.—*The Hereford Journal*. A special meeting of the Newport (Monmouthshire) Town Council has been held to take into consideration a proposition to subscribe a sum of money in order to induce the Council to fix upon Newport as a place of meeting in 1872. The Town Council expressed a unanimous desire that the Society should be afforded every inducement and facility to hold their meeting at Newport, and it was resolved that a sum of £500 should be subscribed by the Corporation towards the holding of the Society's show in the town in 1872. It is understood that a local subscription of about £2,000 will be altogether required, and therefore a town's meeting and a meeting of influential county gentlemen will be held to make up the remaining £1,500.

THE "POSITION" OF WILD ANIMALS IN ENGLAND.—To the Honourable the Commons of Great Britain and Ireland in Parliament assembled. The Petition of the Morpeth Chamber of Agriculture: Humbly sheweth—That a great grievance is caused to your petitioners by the present undefined position of many of our wild animals, some species of which, in some localities, having been almost totally extirpated by being exposed to continuous and indiscriminate slaughter, whilst in other districts some animals are preserved in such enormous quantities as to be seriously destructive to corn and root crops. Wild rabbits, in particular, are so destructive to the produce of arable and pasture lands, that they should only be permitted to exist where an owner confines them within his own grounds, and accepts the responsibility of all damage they commit; and all persons, in possession of the soil, who wilfully permit a burrow used by rabbits to remain open, should be liable to a pecuniary fine, except only in such cases as where they were securely enclosed. That all wild animals when at rest on the soil should be free from disturbance; except only by the owner of the soil or his lessee, such animals when dead to be the property of the owner of the soil, and be under the protection of the law, the same as any other chattel. The owner of the produce of the soil to be in all cases entitled to scare off or kill any wild animal which during the open season is destroying his crops, all such animals being rendered up to the owner of the land or his lessee, and the owner of the produce of the soil being only liable for damages in case of malicious slaughter. That dogs being animals only partially under control, and their unrestrained action on public streets and public roads so frequently injurious to stock and alarming to passengers, that only such dogs as are used in driving stock should be allowed to be at large, on such public thoroughfares. That domestic cats are

such indispensable aids in the preservation of the produce of the soil that they should be protected when on the premises of their owner by a fine on any person destroying them, such fine not to be a barrier to any claim for value their owner may make. Your petitioners, therefore, pray your Honourable

House to pass a law, defining the positions of our various wild animals and containing such provisions as would allow of the greatest enjoyment of our wild animals that is consistent with a due regard to public and private interests; and your petitioners will ever pray, &c.—Thomas J. Ward, Chairman.

WADEBRIDGE FARMERS' CLUB.

At the annual dinner Mr. VENNING of Devonport, steward to Lady Molesworth, said he had always found these meetings profitable and interesting. The subjects generally brought forward were of great interest to agriculturists. He regretted that this year a prize for the best-cultivated farm had not been given, but the secretary would no doubt, explain the reason. One good result had, however, been secured; a ploughing match had been started, and from the success that crowned their efforts last year, there was no doubt that this ploughing match would be very successful. As to the discussion of political questions at these meetings, he was of opinion that when such questions were brought up they should be supported by argument, and the language employed should be moderate and courteous, otherwise an impression got abroad that harmony did not prevail amongst them at these gatherings. With regard to the position of agriculture, he knew that the tenant-farmer had had a most anxious time of it during the past season. The drought had made the last a very trying season; but he could only say that the tenant-farmers had, as a class, met their liabilities as honourable and straightforward men should do, and he had heard similar opinions expressed by gentlemen whose professional duties brought them in intimate connection with tenant-farmers. During the past season farmers had fallen back upon their resources, and fed their cattle upon a good deal of artificial food; but, possibly, that had not been without its advantages, because, perhaps, the trying summer through which they had passed had taught them many useful lessons; and he could not help thinking that on an occasion like the present, if any gentleman had tried any plan which had been found to answer, he should communicate it to his agricultural friends, so that the benefit arising from such experiment might be widely and generally diffused. Passing on to the subject of local taxation, he was of opinion that the question should not be discussed as one solely affecting the tenant-farmer, for he thought the question affected the owners of the soil more than the tenant-farmers; and it was by landlords and tenants uniting in one movement that a proper readjustment of the taxation that fell upon land would take place. This was a difficult question; it was one that must occur, but he was not sure that it was not unduly pressed forward. Depend on it, with regard to all great questions the more they were considered in all their phases, argued and discussed, the better, and the more conclusive in the end would be the measure that would be passed. They knew that the burdens on land affected them; but what would be the effect of their removal on the great body of the community was the question that should be considered. Turning to the Education Act he hoped and trusted (and he believed it would be so) that the country at large was determined to give the New Education Act, with all its merits and defects, a fair trial. And he also thought that those who had really the interests of this country at heart, would not altogether look at the question as one of money. The real question was how to educate the masses and the labouring classes of this country. Shall we give them a good education or shall we not? In the election of school boards he hoped the ratepayers would be careful in selecting the best men to carry out their views, and not be animated solely by the question of economy. There should be no wasteful expenditure; but it would be a most serious misfortune if the operation of the Act and its provisions were cramped by an insufficient expenditure. He believed ratepayers in general were disposed to take a liberal and fair view of the new Educational Act. By this act agriculturists would be more affected than the residents in large towns; he thought it a pity that the question of local taxation had not been settled before this new rate was added to the burden; but the additional pressure might operate as another lever to remove what was considered an

unreasonable and excessive charge. In agricultural districts the operation of this act would be most salutary. In many parishes they would find that voluntary effort would provide all that was necessary—at any rate all that was reasonable, as the act itself was a compromise. Where strong feeling existed for the continuance of the voluntary system, opportunity would be given the clergy and others to build schools and obtain Government grants; and they would shortly see what voluntarism would do. In some districts voluntarism would hold its own, but in the majority of cases he thought school boards would be elected. The compulsory power vested in the boards would he thought be exercised gently. What they wanted was to educate the children, but at the same time in such a manner as to affect or injure their parents as little as possible. The relation between tenant-farmers and landlords was a subject of great interest, because, as education improved, and as they became more acquainted with what was going on in other parts of the country, the more they began to feel that their position should be remembered. He did not think the position of the tenant-farmer had for many years been properly and duly considered. Bringing as they did a large capital to improve the value of the soil, he thought their voice should be heard; and various schemes had been proposed for their security. It did not seem reasonable to any man that a person should come with a sum of money—perhaps his all—be called upon to spend it on his farm, and rely upon the caprice of the landlord whether he sees it returned to his pocket or not, and therefore he thought the tendency was in favour of leases—and leases so expressed that proper provision be made for the security of the tenant. His view was this: A landlord taking a tenant placed out of his power property for many years, in a way which owners of other kinds of property are not called upon to do. The landlord places great confidence in his tenant, and if he did so, he (the landlord) had a right to be properly secured; and therefore it was necessary, in order to meet difficulties which probably might arise, that he should be properly secured in his lease. But at the same time there was no reason whatever that the tenant should not feel that he should have security given him for the return of the capital which he had put into the farm. He objected to model leases; he held that arrangements between landlord and tenant should be unshackled, and then the result would be that the best landlord would get the best tenants, and this would be the cure for existing evils.

Mr. R. G. POLLARD said while he thought that they had much to be thankful for in our English laws, he was also of opinion that they had much to be sorry for. At the meeting of the Callington Agricultural Association which was held a short time since, Mr. Snell alluded to the injustice of some of our English laws, and also ventured to say that there was one law for the rich and another for the poor. No doubt some of them would consider that language such as that was somewhat strong, but he feared that in many instances there was too much reason to believe that Mr. Snell was justified in saying what he did. Let them take, in the first place, the Game Preservation Act. If a policeman in his morning walk met a man with a hare or rabbit in his pocket, that man was immediately brought before the magistrates and convicted for an offence against the law; but if a poor cottager lost a duck or a fowl, and a man was found with the stolen property in his possession, that poor cottager had to go through all the forms of proving ownership and identifying the duck or fowl before the thief could be convicted. In the case of the rich man and his rabbits there was no necessity for his doing anything of the kind, and this was what he called an anomaly of the law. Take another case: When a tenant-farmer, who was in occupation under a rich landowner, through a combination of unfortunate circumstances became insolvent, the poor

tradesman who supplied the house with groceries or other such necessities found that there was not a single penny for him, while the landlord could step in and take charge of everything that was upon the farm.

Mr. GROSE said it was very certain that farmers would never agree in Cornwall as to the best breed of cattle to keep upon their farms. The fact was that where a Shorthorn would flourish on one side of a hill, it would scarcely exist on the other, and therefore whatever breed they made up their minds to keep, the great point was to have the best of that breed, and keep them in good condition. Of late years artificial

manures had sprung up, and in the growing of corn crops they had had recourse to those manures to a great extent; but he did not believe that artificial manure had that effect upon the soil at the present time which they had ten years ago, and his own opinion was that they should use the more artificial food, and less artificial manure. There was a great difference of opinion as to the best way of consuming artificial food. Some said it was better to pass through the bullock; others that it was better to pass through the sheep, and he had found in his experience that the latter was the best.

COMPARATIVE TAXATION.

At a meeting of the Statistical Society, Mr. R. Dudley Baxter read a paper on the subject of Comparative Taxation on Real Property, Personalty, and Income. The chair was taken by Mr. Newmarch, F.R.S., President of the Society.

Mr. BAXTER said, amongst much other matter,

Let us briefly consider the chief sources of income, spread, as it were, in a panorama around us. There is the land, in all its varieties of hill and dale, forest and pasture, arable fields and gardens, permitted long ago by the State to be appropriated as the property of individuals, because in that way only could industry be allured to cover its surface with soil and roads, and hedges and crops, and animals useful to man. But industry has very largely improved, and sometimes many times increased, the land's intrinsic value, and renders many a well-cultivated field as great a triumph of constructive skill and capital as a manufactory. There are buildings of all sorts, placed upon small portions of the land granted by the State, on which the art of man has built, out of stone and clay, edifices of great usefulness and value—houses to dwell in, factories for manufacturing, warehouses for storing, and shops for carrying on our sales and purchases. Again, there are all those great undertakings, requiring a larger use of land, to which the country owes so much of its advanced civilisation—the railways and canals that intersect with their lines of communication the length and breadth of the country, the mines and quarries by which mineral wealth is dug from the bowels of the earth, and the works by which some of those minerals are moulded into useful shapes, or converted into light and fuel for the use of our streets and houses. Besides these immovable properties, there are vast collections of movable wealth, ships for conveying our commerce, manufactured goods, and articles of food crowding our stores and shops; horses, cattle, and sheep filling our outbuildings and fields; and furniture adorning and rendering comfortable the interior of our homes. Clustering round these properties, and exceeding them all in annual revenue, are the industries of millions of living men, who tenant and work these immovable properties, who create these movables, who raise and consume this food, and the reward of whose intelligence and labour amounts in its yearly aggregate to hundreds of millions sterling. But within and at the kernel of two many of these properties, and sitting as helper or lord of many of these industrious men, is another species of property, that we call a mortgage or debt—a property within a property, a sleeping partner among workers, and sometimes a master among slaves; usefully supplying deficiencies in their strength, and substance, but too often appropriating the lion's share of the benefit, and exacting protection from every hardship and burden, which it leaves to be borne by its less fortunate entertainers. Add a crowd of public and private mortgages and securities held by Englishmen in our colonies and in foreign countries, that send year by year over the sea their monetary tribute, and we shall complete a faint summary of the national wealth. In order to obtain a clear view of the direct taxation of this wealth in England and Wales, it is necessary first of all to ascertain, with some degree of approximation, the annual value of each of the different classes of property and income of which it is composed. Their total amount can be approximately obtained from the schedules of the income-tax, and from the estimates of earnings below income-tax in my book on national income. These totals, and their different items, are shown in the table of gross income given in the appendix, and are arranged under

three heads. 1. Real property—lands, houses, and works. 2. Personal property, and mortgages—business and floating capital, furniture, &c., public funds, and private securities in the United Kingdom and in the colonies and foreign countries. 3. Profits and earnings, subject to income-tax, below income-tax. These three main divisions appear to represent most nearly the great classes into which property and income are divided, using the terms in their popular meaning, and not as the same as the technical and legal terms real estate and personalty. But the table shows blanks for some of the subordinate items, which are not given separately in the income-tax returns, and can only be supplied by estimates. At the same time, such estimates are absolutely necessary if we wish to obtain anything like a true idea of the relative magnitude of these different classes, and of the pressure of taxation upon each. These items are: 1. Mortgages of real property. For an estimate of these there is an important precedent in Mr. Gladstone's great budget speech of 1853, when, reviewing the income-tax and its different schedules, he went into the question of its comparative pressure on realised property and precarious incomes, and gave a calculation of the net incomes of land and houses, after deduction of mortgages and charges. The estimate which I have formed of the proportion of charges on immovable property is taken from the experience of conveyancers largely engaged in the transfer of property, namely, on land and houses one-third of the annual value, and on works one-half. The mortgages and charges on real property are estimated at £53,000,000 a year. Interest on capital employed in business—On the average of businesses, taking those with large stocks, like farmers, or with large book debts, like some kinds of traders, as well as those with small—this interest may be estimated at one-fifth of trade incomes. Annual value of the dead capital invested in furniture, &c. This may be estimated at one-twentieth of the income tax-paying incomes, or a total of £20,000,000 a year. It is necessary to add this amount to the gross income, in order to compare the different kinds of property and the result of their taxation under successions. Having dealt at great length with the argument from history on the subject of local taxes, direct taxes and imperial taxes on property and income, Mr. Baxter stated the following as the conclusions from the facts stated: Everyone will agree that the present system of direct taxation, both imperial and local, is very irregular and anomalous, and requires consolidation and reform. As regards imperial taxes, what can be more absurd than the treatment of leasehold property, which is subjected to double taxation, both as real estate and personalty? What more anomalous than the law that personal property passing by will pays probate duty, while personal property, entirely in the same position as regards other taxes, but passing by settlement, pays none? As regard local rates, what can be wider and more irregular than the whole system of their imposition and administration? Would that we could adopt some broad view and comprehensive arrangement that would introduce uniformity and equality into our present capricious and unsystematic system! Everyone will, I think, also agree that it would be a good thing to relieve the dwellings of the poor from bearing so much of the burden of maintenance of the poor. Most economists agree that half the rates fall upon the occupiers, and are paid by increased rent, even when the owner pays them in the first instance. Some economists, like Professor Rogers, believe that the whole burden comes out of the occupier's pocket. Either way

it ought to be an important object of public policy to throw some of this burden off the poor and place it on the shoulders of the now exempt owners of personal property. Everyone will also concede that this is also desirable in a sanitary point of view, and for improvement of the health of the people. But further, we ought to do something to remove a portion of the great inequality that exists between the burdens of real property and personalty, and still more as compared with earnings. Why should land pay $15\frac{1}{2}$ per cent. of direct taxation, and houses $14\frac{1}{2}$ per cent., or 11 per cent., according as they are leasehold or freehold, when personalty only pays $8\frac{1}{2}$ per cent., and earnings $2\frac{1}{2}$? It is an excess beyond all reasonable proportion. If we add the effect of mortgages, it becomes more disproportionate still. This disproportion has gradually grown up, and is constantly growing larger still. Two per cent. was added in 1853 by the succession duties. One per cent. is now being added by the transfer of turnpike roads. The threepenny education rate will add one per cent. more. I maintain that it is an economical mistake to load exceptional taxation on any kind of property. It is unjust, and it is also unwise. It prevents the circulation of capital. It discourages improvements. It hinders the land from increasing its production, and so inflicts an absolute injury on the nation. But it also discourages and hinders the poor man from acquiring a house or a piece of land. I always wonder at my friends of extreme political opinions, who unite two such irreconcilable aspirations, that in one breath they lament the divorce of the poor man from the land, and profess themselves eager for a country of peasant proprietors; while with another breath they call for heaping additional burdens on the land. The two views are absolutely incompatible. If they succeed in one they must fail in the other. But surely their love for the peasant ought to be stronger than their hatred for the landowner. I too should like to see peasant proprietors, every man saving money to buy his own house and his own rood of land. But I want to lighten the burdens that deter them, not to heap on new burdens to prevent them. As to measures. Why should we continue two distinct valuations, one for rating purposes, with fair deductions for repairs and expenses, the other for income-tax, without any deductions at

all? Why should not both be consolidated into the poor-rate valuation? I think that both householders and landowners are entitled to demand this of Mr. Gladstone, and that they should no longer be so exceptionally taxed, as he himself has shown, in their payment of income tax. Why should not also the other schedules of the income tax contribute their quota towards the poor? We have instituted a common fund for London, out of which certain common expenses are paid, and the cost of in-door relief. Extend the principle to the whole kingdom, and let schedules C and E and the unrated portion of schedule D supply such a common fund, and bear this portion of the expense. An eminent French writer on finance, M. Dupont White, says that the income tax, levied in England on the total resources of the country, is a tax of more advanced civilisation, and that our rates on real property are a relic of the middle ages. I am persuaded that we must have larger recourse to this as the oldest and most equitable tax, in place of partial burdens on limited classes of property that grew up during the eighteenth century, and that we must endeavour to lessen the anomaly and injustice of charging 12 millions of rates solely upon net income of £93,000,000 out of the £390,000,000 of property and income liable to income tax in England and Wales, and of distributing the total £30,000,000 of direct taxation of England in these absurd proportions— $3\frac{1}{2}$ millions on £145,000,000 income from earnings, $10\frac{1}{2}$ millions on £152,000,000 income of personal property, and $15\frac{1}{2}$ millions on £93,000,000 net income of real property.

A discussion followed, in which the Chairman, Mr. George Harst, Mr. Frederick Purdy, Mr. Cornelius Walford, Mr. Hyde Clarke, Mr. Campbell, Mr. Arthur H. Bailey, Mr. William G. Lumley, Mr. Vernon Harcourt, Mr. Chadwick, Mr. Noble, Mr. Applegarth, Mr. Rawlinson, and Dr. Guy took part. One question debated was whether local burdens could be regarded as taxes, or as being in the nature of a rent-charge on land and houses; while some of Mr. Baxter's conclusions were challenged, more particularly the comparatively high taxation to which it was said land was subject, but a general opinion was expressed that anomalies existed in the incidences of taxation which demanded the attention of the Legislature.

The proceedings closed with the usual votes of thanks.

"BRANCH" CHAMBERS OF AGRICULTURE.

At the annual meeting of the Lincolnshire Chamber of Agriculture,

Mr. BRAMLEY said he was quite satisfied that Chambers of Agriculture were institutions likely to be of great service. It was therefore most desirable that a Chamber should represent the whole county. They had frequently great difficulty in getting gentlemen to attend the meetings held in Lincoln, consequently they did not get the opinion of the county generally. If by forming committees and branches in different parts of the county they could add to the efficiency and influence of the Chamber, it was most desirable that such branches should be established. He would propose that a committee be appointed to inquire how far it was desirable to encourage the formation of branches, and that the Chairman, and vice-Chairman, and five members form the committee to report to the Chamber. He did not propose that the branches should be separate chambers; they might elect a portion of the Council in their own intermediate neighbourhoods, and be made generally useful in their respective localities.

The following gentlemen were appointed to act as the Committee: Messrs. Trotter, Scarby, Bramley, Seagrave, and Epton.

Mr. TURNOR said it was an old difficulty, the county was so large and the railway communication with the county town from some parts of the country so poor that it was absolutely necessary something should be done. The same difficulty had been felt in Devonshire, Yorkshire, and other large counties.

Capt. CRAGIE had seen the formation of Branch Chambers in Yorkshire and Warwickshire. Members residing in the neighbourhood of the principal market towns held their meetings and discussions on various questions at those towns, and they gathered practical knowledge from farmers at meet-

ings of that sort which they had no chance of getting in cases where it was necessary for them to attend a meeting at a considerable distance. On the other hand it would not be desirable to weaken the Central Chamber by forming too many branches. Such branches might be made of great service in the collection of funds, part of which might be retained for local expenses, and the remainder forwarded to the County Chamber. Of course each member would be a member of the Central Chamber and not of any particular branch. It was proposed to hold migratory Councils; if at the same time they would encourage the formation of Branch Chambers, nothing would tend more to strengthen the Central Chamber.

Mr. WINN was certain that unless something was done the Chamber would soon be incapable of doing much good. He found the greatest possible want of sympathy on the part of many he had met in the Chamber of Agriculture. The only way to keep the Chamber alive and the county interested in its existence, was by the establishment of branches. Any additional cost would be more than repaid by the increase of members. He had looked over the list of members, and, as far as he could judge, not more than 50 out of the 240 were from the northern part of the county. This number would be largely increased if meetings were held occasionally at Louth, Grimsby, and Brigg.

Mr. E. HENRAGE, the chairman, said it would be most desirable that the Council should be migratory, and it would be for them to consider whether the members of the various Farmers' Clubs now in existence should not be allowed to become corresponding members of the Chamber of Agriculture. Brigg, Grantham, Louth, Boston, and Long Sutton would be good places for the establishment of branches and for meetings of the Council. He was surprised that so large a county showed a list of only 246 members.

THE CONDITION OF THE FARM LABOURER.

At the annual meeting of the Stowmarket Farmers' Club, Dr. SHORT said: I would ask you to consider these questions—The condition of the agricultural labouring classes; Is it better than it used to be? Is it as good as it ought to be? If it be not, with whom rests the blame? And (having already presupposed the disease) what are the remedies to be applied? The religious and moral state of the labouring population, although of great interest and supreme importance, was not a matter on which he proposed saying more than a few words, but, bearing as it did on all the other states, thus much should at least be said, that if we take the religious condition of the country half a century ago, and compare it with what we may fairly and honestly believe it to be now, it will be admitted on all hands that there has been an advance. This statement held good of the poorer classes as well as the richer. Still, we would hardly wish to "rest and be thankful," but endeavour to attain to still higher things. The educational state of the poor, through the education scheme which had recently become law, had been of late the most prominent feature of home politics, and one would not be justified in passing it over without a slight reference. That the education of the poor had been neglected in days gone by, the present state of the aged poor was sufficient evidence, but that the Education Act would prove a universal panacea he much doubted. Great strides had been made in the last 40 years; and whilst the old adage said that "a little learning is a dangerous thing," still there was such a thing as over education. He was not in favour of such radical changes as were proposed, believing that in most country places an efficient and satisfactory education by day and night schools had been already provided. He read a letter he had received from a school inspector, who said what he had observed in his own district was that while the majority of men of the labouring classes between 40 and 50 and upwards could not read or write, the majority of those under 40 could do both more or less. This was not the case with women, who generally had, as girls, better chances of learning a little than the boys. For 35 years there had been in nearly every parish a school, where the young had had the opportunity of elementary education. He did not think direct compulsory education would go down, but saw no reason why indirect compulsion should not be applied. Let no person be allowed to employ any child for any kind of labour under eight years of age, and let no child over that age be employed without a certificate that he could read and write. In all schools he inspected a very fair education was being given in the surrounding parishes. He should think Suffolk by no means behind other counties. Education had vastly improved in the last 35 years. As to the question whether the poorer classes care more for education than they did, his answer was they liked it when it was got, they cared less for the getting. In theory they were great admirers of education, but in practice some were very careless about sending their children to schools. They were apt to undervalue schools; this, of course, proceeded from ignorance, and he trusted time would remedy it. On the whole the future of education in this country held out a bright and promising prospect, provided always they did not over educate and make the poor dissatisfied with the station in life in which God had placed them. As to the New Act, he did not at all think it would work well in the rural parishes, still less would the compulsory system. Beyond this the Act was very much what they had been doing on the voluntary principle. He was an unflinching advocate for the religious element, and would never condescend to teach children to be merely good scholars without teaching them at the same time to be good Christians. The time table liberty clause, which provided that parents might withdraw their children from the religious instruction which they objected to, precluded the possibility of any grievance on the part of Nonconformists. He spoke, of course, of Church Schools already built with Churchmen's money and for definite Church teaching. The religious difficulty existed more in Parliament than out, and he was afraid it was only the cloak for "political dodges," such as dis-

establishment. As to the physical condition of the working men of the agricultural class. Their daily habits and the nature of their occupations had changed less than those of any other class, and they had been placed in circumstances more conducive to health than formerly, their wages were certainly higher, and their work not harder, indeed not so hard, owing to the introduction of machinery. They had better dwellings, wore better clothes, and, unless they excepted the time when many farm labourers were boarded at farm houses, were better fed than formerly. The chief subject he wished to bring under their notice was the sanitary condition of the class under discussion. To the question, Was it improved? they might with perfect honesty answer Yes. Although it had been stated with regard to the cottages in Suffolk, and Norfolk that matters could not be worse, that their condition was "miserable," "deplorable," "detestable," and "a disgrace," and that it is impossible to exaggerate the present state of things, speaking for their own district and county he said this was a misrepresentation, a libel, on their fair fame. Cottages had improved and were improving, not but that they must admit that there was still room for considerable improvement, but, speaking from intimate knowledge, he asserted that sanitary matters were steadily progressing. The squalid hut, little better than a pigsty, nay, not half so good as the pigsties shown by Mr. Stearn the other evening, were now the exception and not the rule. But to the question, "Is the sanitary condition as good as it ought to be?" he replied, Decidedly not. The defects were defective drainage, impure or defective water supply, and overcrowding of small dwellings. In many instances the privies were built too near the houses, the effluvia entering the open windows, and accommodation of this kind was frequently insufficient. Under defective drainage, he also classed ash-pits, middens, small dunghills, pigsties, built too near the house. He illustrated this point by comparing the mortality in two Suffolk towns of the same size, when both were undrained, on an average of ten years. In A the rate was 1 in 67, and in B 1 in 69. In the second ten years A, being drained, was 1 in 72, and B, undrained, 1 in 67; in the third ten years in A the rate was 1 in 71, and in B 1 in 59. As to the impure water supply he quoted a case which occurred in his own practice, which produced an outbreak of fever. Two cottages were supplied with a well 12½ yards deep, which was filled by [surface draining, and in very hot summers became dry. When the water was low it (to use the words of the people occupying the houses) "stank very bad," and the next resource was a small partly dried-up pond. The privy was three yards from the house, and the ditch into which it emptied itself twelve yards from the well, the soil being washed away into the earth when rain came. In the summer of 1869 the occupants of both houses fell down with fever, and in 1870 there was again fever. Six children working in a gang on the farm were accustomed to drink the water daily, and all fell down with fever, and one died, but those of the gang who did not drink the well water escaped illness. A day or two since he went into a cottage which had only one room up-stairs, and that with a sloping roof on both sides. It was about 10 feet by 8, and here nine persons slept in a cubic space not more than enough for one. Not long since he reported to the Stow Board of Guardians another case in which 16 persons slept in a house of three rooms, one family in one room, and two husbands with their wives and children in the other. He adduced these cases to show that there were such, and that the evil required to be looked into and remedied, and that he was not taking a one-sided view of the matter. Still this was the exception, not the rule. He passed on to consider whose fault it was that this state of things existed, and did not hesitate to say that there were faults on both sides. He instanced some of the causes for the bad condition of the dwellings of the poor—the cottage being mortgaged, their being the property of absentee landlords, their being the property of small people, who get every penny they can in rent, and care nothing for the tenants. In some instances the larger landlords were to blame; but, on the other hand, did the poor always take the care they ought

of their habitations? They did not. There were families to whom no one would let a respectable house—thrifless, improvident people, who would damage or destroy it, to the detriment of their own comfort and the injury of the landlord. Having, then, postulated this, viz., that there is a sanitary disease existing, what are to be the remedies for its cure? In districts where there is no such officer, the appointment of a sanitary inspector. We have one in the Stow Union, and already we are beginning to see the fruit of his labours, and have, no doubt, in future days, by the increase of the health rate, the lessening of sickness, and consequent reduction of the Poor Rate, we shall in our pockets feel it also. Better drainage by all means is required, the better construction of closets (privies), and their removal further from the dwellings, the trapping of drains running from or near houses, removal of pigsties and dirt heaps also. Better water supply above everything (where there is an insufficiency), better sleeping accommodation where this can be contrived (and in newly-built houses this point considered), prevention of over-crowding by taking in lodgers, and on the ground of morality itself the separating during sleeping hours of the elder and younger members of the families. And, lastly, better landlords where there are bad ones, and better tenants also. Of the good that has been done to our agricultural labourers by the allotment system, of its effect in creating in them a spirit of emulation, honest pride and independence, as a means of spending his spare time in a much better way than it might be spent; of Benefit Societies and their results, of village Clothing and Coal Clubs, village reading-rooms and libraries, all of them bearing on the state and well-being of our labourers; he should say nothing further than thus alluding to them.

Mr. COCKSEGE had found, from several of the researches he had made, that Dr. Short's view was correct—that there had been an amelioration in the condition of all labourers in this country. In the year 1685, when one-fifth of the people of England were then employed in agriculture, Sir William Petty said that 4d. per day with food, and 8d. per day without food, was the general pay of an agricultural labourer. The Justices of Warwickshire, in the same year, at the Quarter Sessions, fixed the wages of a labourer at 4s. from September to March, and 3s. 6d. for the rest of the year. In Devonshire the rate of wages was 5s. a week, but at Bury St. Edmund's the Magistrates, in 1682, resolved that the wages should be 5s. per week in winter, and 6s. in summer; at Chelmsford the rate was 6s. in winter, and 7s. in summer, and that seemed the highest amount paid at that time in the kingdom. The necessaries of life were then very dear, for wheat was 70s. a quarter. In manufactories the workmen were paid about 1s. a day, and often were forced to work for much less than that.

Mr. HENRY CROSS had begun paying for agricultural labour forty-five years ago; yet he did not intend to make a remark on that point because he was not now an employer of labour. As far as cottage accommodation went, he could speak, and could say that in his remembrance cottage comfort had very much increased. The enclosure of commons and roadside waste had, however, not worked for the benefit of the labourers in one respect, as they used to serve to assist wages. The pig of the labouring man used to be grazed by the roadside, and the garden was often manured from the same source. Still he thought there could be no doubt that the labourers had increased their use of luxuries. When he first began to pay labourers a great many of them ate brown bread; a piece of white bread was not a common thing amongst them. Now, white bread was always used by the labourers. They had greater facilities now for purchasing luxuries, as there were more shops than formerly. Most of the poverty amongst the labouring classes was caused by the large families. An employer could not, of course, pay a man more because he had a large family, and many a man was considered a hard master on that account. It was the large families in the small and inconvenient cottages who made the rougher of the labouring classes. The reason was that such people had not the opportunity of keeping their cottages in so good trim. He found also that there was great difficulty in getting good tenants when there were good cottages. They would work the gardens well enough, but the most industrious of them would scarcely keep the back part of their premises in good order. He could quite agree with Dr. Short as to keeping nuisances at a distance from the house, but it was one of the greatest difficulties a landlord had to encounter.

Mr. COCKSEGE asked if Dr. Short considered black or rye bread good to eat? Almost all authors considered that England was in a low state of civilization when the people ate black bread. When in the countries on the Black Sea, he had found that the people almost all ate black bread. He had himself got accustomed to, and to like it, and found that two slices eaten in the morning would be sufficient to carry him through the day. They had, however, very good butter, and the people thrive upon it. They were very muscular, large boned men, and very strong.

Dr. SHORT said brown bread, or the "whole wheat" bread now advertised very largely, was, no doubt, very wholesome. It was only another form of brown bread. The rye-bread Mr. Cocksege had referred to was likely to do harm, because the rye was apt to be what was called in farming language "spurred," that was, a black smut on it, and that fungus became what was called ergot of rye, which was used in medicine. In using much rye-bread, this might be taken into the system and produce a form of dry mortification, or dry gangrene. Even in two or three cases where ergot of rye has been given very judiciously, dry gangrene had supervened. Mr. Cocksege had told them of the effect of rye-bread as food—that those who ate it in the morning required nothing else during the day.

Mr. COCKSEGE: Except beer; I ought to have mentioned that.

Dr. SHORT said that in the countries where rye-bread was extensively used there was much dry gangrene. In Siberia, where the Russians sent their prisoners, and black bread was used, dry gangrene was very prevalent.

Mr. MILLER could testify that the labourers were better off now than when he was a youth. When he was a boy it was a common thing to see boys and girls running about without shoes or stockings—a thing scarcely ever seen now. The men did not earn so much then as they did now, and within his memory agricultural wages, as compared with the price of corn, were higher. He could refer to a memorandum from an old farming account book, showing that a farmer had sold a score of wheat for £95, and paid 2s. 6d. a coomb for thrashing it. What would they think of that now? At that time the families earned more than they did now. One great drawback at the present time was that the families of the poor were now deprived of the spinning. In his early days he had heard of families, where the man was not very prudent, in which the woman would call up her family at an early hour and do enough spinning before breakfast to procure that meal at the shop. With regard to the sanitary condition of the poor, he sometimes thought there were not the facilities for their habitations that there ought to be. The larger owners could provide good cottages, but the smaller owners who had to derive income from cottage property, could not make their cottages what they ought to be. Cottage property ought not to be so heavily taxed. As soon as a cottage was built it was rated, and though the rate ultimately fell upon the occupier, yet at the first it was borne by the owner. With regard to Income-tax, if they paid 4d. in the £ for ordinary property, they had to pay 7d. for cottages, because they paid upon the gross rental; and, as they all knew, they did not get anything like the gross rental after allowing for loss of rent and repairs. He thought, therefore, that these drawbacks ought to be removed, and every facility given for the erection of cottages, so that people could have some chance of getting interest for their money. If a system could be devised so that people could get a moderate interest for their money in cottage property, there were many benevolent individuals who would do what they could to improve the dwellings of the poor, but so long as they were subject to an extraordinary tax, it could not be expected that they should build cottages.

Mr. H. A. OAKES asked, if no children were allowed to go to work till after they were eight years old without a certificate that they had attended school, how much knowledge Dr. Short expected a child to have at that age.

Dr. SHORT said that suggestion was not his own. He had met with it and adopted it as it appeared to him to be a very good one. It was in a very sensible letter upon education that he met with that suggestion.

Mr. H. A. OAKES then asked, if the labouring classes had more comforts than in former days, what they must have when a man had to support a family upon 9s. or 10s. a week? The extraordinary part of it to him was how they lived. To him

it was a case of existence, not living. They trusted to the harvest to pay their rent, and in a season like those which they had had for the last two or three years, the harvest had not amounted to much, especially on the light land, as it was so very quickly over. Again, he would ask how it could be expected that a labourer should be able to send two children out of seven or eight to school when he was earning 8s. or 9s. a-week. The elder children could only assist him to live, and if two of them were taken out of the family and prevented from earning their 2s. or 2s. 6d. a-week, they reduced that man's income £10 or £12 a-year. As to education, of course, he did not object to that, but thought we were now working a little too much on the present generation for the sake of the next. The educated labourer would obtain higher wages, but, so far as he could see, the agriculturist would have to pay for that, as the labourers would, the better they were educated, be the better enabled to become mechanics, and to work for such firms as Messrs. Woods and Cocksedge, which they would do rather than continue on the land. They would, therefore, advance the position of the labourer, and have to pay for it.

Mr. J. H. HEIGHAM, the Chairman, said that when he was quartered in France, when a young man, he had been astonished at seeing the black bread so much used, and generally the wretched way in which the people lived. He knew that his own labourers always had good white bread. Their style of dress had also much improved during his own recollection. He could recollect their wearing, in his own parish, where he had lived since he was 25 years old, long slops of common material, but now they could always be seen at church with good cloth clothing, gaiters, and highlows. Wages had also improved, and where he had paid 7s. and 8s. a-week he now paid 10s. or 11s. He thought, therefore, that they might very safely say that the condition of the labourers had improved.

Mr. WOODWARD said of cottage property, that the return in the shape of rent was insufficient, in most cases, to pay five per cent. on the outlay, and that was one reason why they were so badly built and arranged. He should be glad to be without his cottages, if it were not for the accommodation they were to his own labourers. The condition of the labourer had no doubt improved. As to the question Mr. Oakes had asked—how a labourer could keep his children at school on 10s. a-week—the labourer with seven or eight children was in a better position as soon as they began to earn money.

Mr. OAKES said that Dr. Short had spoken of children under eight years of age—they could not work.

Mr. CROSSE: But he could not have seven under eight years of age.

Mr. OAKES: Oh, yes, he might.

Mr. WOODWARD: I can only say I hope that is an exceptional case, and not the rule. The number of children a labourer had to keep was not always a criterion as to his condition socially, as he was better off as soon as they were got out to work, and the father would soon be taking £1 a-week of his master. He had found that children from large families invariably made the best servants, because they had been obliged to work early. The landowners had done all they could for the education of the poorer classes, and he denied that they were kept in ignorance, as had been stated. The cottage-accommodation was not so good as it should be; but that was in some measure due to the tenants as well as to the landlords. There were a great many tenants who did not deserve a cottage at all.

A vote of thanks was passed to Dr. Short.

OBITUARY.

DEATH OF LORD WALSHINGHAM.

We regret to record the decease of this nobleman, which took place at Merton, by his own hand, on Saturday, Dec. 31st. Lord Walsingham, of Walsingham, in the county of Norfolk, fifth Baron, was born on July 6th, 1804; succeeded his father in 1839; married, in 1842, Augusta Louisa, eldest daughter of Sir Robert Frankland Russell, by whom he leaves issue the Honourable Thomas de Grey, M.P. for West Norfolk since 1865. This lady died in 1844, and his Lordship married, secondly, in 1847, the Honourable Emily Elizabeth

Julia Thellason, eldest daughter of Lord Rendlesham, by whom he leaves a numerous family.

Lord Walsingham was elected a Member of the Council of the Royal Agricultural Society of England in 1855, and a Vice-President of the Society in 1861. He filled the office of President in 1860, in which year the annual show was held at Canterbury. He joined the Smithfield Club in 1851, and was elected President of the Club for 1863. His Lordship was also President of the Wayland Agricultural Association, the meetings of which have been held at Watton, near Merton, for 30 years. As an agriculturist, Lord Walsingham was chiefly famous for his Southdown flock, for some years past the most successful of any in the country. On the Home Farm, at Merton, which has been much improved of late by marling and scientific cultivation, there is a Southdown flock which dates back for about forty years. The sheep, however, were originally small; and when Lord Walsingham first began to think of exhibiting, he was told that the soil was too poor, and that animals from it would always be beaten by those which came from better lands; as this at first was the case. But some success came in 1851, at the Norfolk and Yorkshire shows; while since then, Lord Walsingham has continued to improve his position, until at length, for seven times in eight years, he has won the Gold Medal or Cup at the Smithfield Club, culminating his honours at the last two shows with the Champion Cup for the best pen of sheep "of any age or breed" in the Hall. The foundation of the improvement in the Merton flock traces back to Jonas Webb, of Babraham; but constant resort has been had to the stocks of the Sussex men themselves, such as Messrs. Rigden, Hart, Turner, Ellman, and Boys.

At the time Lord Walsingham succeeded to the Merton property, a considerable portion, about 4,800 acres, was held in large rabbit-warren farms, one consisting of as much as 2,100 acres. His Lordship's first object was to get rid of the warren as the leases fell out, and that was effected in the course of a few years. This step necessitated the building of farm-houses and premises, and the sub-division of the land; and the holdings here now range from about 600 to 700 acres, while pains have been taken of late to reduce the rabbits. The main improvement necessary was to strengthen the staple of the sandy soil by marling or claying, for which there existed every facility. This proceeded slowly in the hands of the tenants, and large tracts were consequently taken in hand by Lord Walsingham himself, who at one time occupied in all about 3,500 acres. Large portions have now been marled or clayed at the rate of from 80 to 100 loads per acre, or, in some instances, much more, and the arable lands divided by fences. Enough already has been effected to show that, by liberal but not necessarily very expensive cultivation and careful farming, good crops may be grown on land where formerly the produce was but little more than rabbits. A portrait of the late Lord appeared in the *Farmer's Magazine* for July, 1870.

The succession to the Peerage of the Hon. Thomas De Grey, will cause a vacancy in the representation of the Western Division of Norfolk. The announcement of his father's death was telegraphed to Mr. De Grey, who was at once summoned to Norwich from Gunton, where he has been shooting with the Prince of Wales. The new Peer entered the House of Commons as member for West Norfolk, and moved the Address to the Throne in 1867, during Lord Derby's Government. The first peer was Lord Chief Justice of the Court of Common Pleas from 1771 to 1780, and the second was for twenty years Chairman of Committees of the House of Commons. The barony was conferred by George III. in 1780.

The cause of death was at first kept private, but it was impossible to avoid an official investigation, and a coroner's jury have returned a verdict, "That the deceased killed himself while of unsound mind."

THE EARL OF AYLESFORD, after an illness of only a few weeks, died on Tuesday morning, Jan. 10, shortly before two o'clock, at the family residence in Grosvenor-street. The deceased Heneage, was the eldest son of Heneage Finch, Earl of Aylesford, and Baron of Guernsey, in the peerage of England, by Lady Augusta Sophia Greville, fourth daughter of George, second Earl of Warwick, and was consequently brother of the Countess of Dartmouth. He was born 24th December, 1824, and married, 7th May, 1846, Jane, only daughter and heir of the late Mr. John Wightwick Knightley, of Bury-off-

Church, Warwickshire. Previously to his accession to the peerage, in 1859, he represented South Warwickshire in the House of Commons from 1849. The family honours are inherited by his eldest son, Heneage, Lord Guernsey, born on the 21st February, 1849, and married only on the 8th inst. to Edith, third daughter of Colonel Peers Williams, of Temple House, Berks. Lord Ayleford was very partial to the pursuits of agriculture, took an active interest in the improvement of his estate, and had established a very good herd of Short-horns, a steer from which was the best of all the beasts at the Birmingham and Smithfield Club Shows of 1870. Lord Ayleford was a Vice-President of the Smithfield Club.

DEATH OF A SUFFOLK AGRICULTURIST.—It is with regret that we have to record the death of Mr. George Dobito, of Croyley Grove, Lydgate, near Newmarket, after a long illness, aged 59. Mr. Dobito was well known in the Eastern counties as an agriculturist, more especially for his black-faced flock. He also frequently acted as a judge of riding horses, being very fond of hunting as well as of cricket and chess. Mr. Dobito was a man of much ability, and in his earlier day wrote a prize essay or two for the *Journal* of the Royal Agricultural Society.

THE LANDLORDS AND THE CENTRAL CHAMBER OF AGRICULTURE.—It was erroneously supposed, when Chambers of Agriculture began to be formed in different parts of the country, that they were established by tenant farmers with the view to protect their interests, but it has lately transpired that they were promoted by and intended to serve, not the interests of the tenant farmers, but those of their landlords. It would naturally be presumed that the Central Chamber of Agriculture in London, was an association of tenant farmers, but what do we find to be the case?—why that more than one half of the members of this Central Chamber of Agriculture—altogether less than 200—are *not farmers* at all but *landed proprietors*. We make this statement on unimpeachable authority, and, as it consists of so large a proportion of landed proprietors it is but natural to arrive at the conclusion that in seeking their tenants' interest they are really looking after their own. The first active step of this Central Chamber was an agitation for the abolition of the Malt Tax. What was the idea that prompted this? Why, simply the hope that it would raise the value of inferior barleys, make farming more profitable, and enable them to raise rents. What are they doing now? Why the Central Chamber has been endeavouring to get a memorial to Parliament on the question of Local Taxation proposed and carried at the various courts of Quarter Sessions throughout the kingdom, similar to that which was proposed by Mr. Lopes at our own court a few days since. And what is proposed by this revision of Local Taxation? Merely to take certain charges now made on land and house property in real estate, and transfer them to the general charges of the country. In plain English Mr. Lopes's proposal is to take the taxes off the land, and impose them on the commercial and manufacturing interests. But what would be the result of such a course; would tenant farmers benefit by its adoption? Mr. Lopes did not pretend to say they would. He honestly and fairly alleged that his real object was to benefit landed proprietors. Sir George Jenkinson, however, was not so straightforward, and pretended that the motive was to benefit the struggling tenant farmers. But what said Lord Lichfield when the subject was agitated at the Worcestershire Chamber of Agriculture, and the attempt was made to show that it was not in the interest of the landed proprietor but of the tenant farmer that this proposition was made? He told them plainly that it was idle to suppose that they would benefit by any reduction of local taxation, but that if all rates and taxes were alienated from landed proprietors, it would only result in increasing the value of land, and landlords would demand proportionately increased rents. This was speaking the plain truth, and if Sir George Jenkinson again addresses tenant farmers on the subject of local taxation, and tells them he is agitating the question for their benefit, they may believe him if they well. In spite of the pressure of the county and other rates, rents have been for years past steadily rising, and continue to do so.—*The Wiltshire Independent*.

LOCAL TAXATION.—At a meeting of the Warwickshire Chamber of Agriculture at Rugby on Tuesday, Mr. Gardner, the secretary of the Local Taxation Committee read a long paper embodying the views of the committee, with which our readers must already be familiar. Sir R. M. C. Hamilton, the chairman, Mr. Devonport, M.P., and Mr. Caldecott, subsequently spoke to the question, but the farmers present took but little part in the discussion. Towards the conclusion, however, of what appears to have been but a tame meeting, Mr. Walton (Shipston-on-Stour), said he thought that the increase in the value which land derived from the investment of capital should be held sacred and inviolable from taxation until such a time when the tenant had from low rent repaid himself for the amount he had laid out. They should induce capitalists to invest their capital on land, the value of which depended in a great measure upon the amount of money invested upon it. By driving capital out of the country, they would reduce the value of the land, and he thought, therefore, that it was a question of land *versus* capital. Mr. Gardner thought that Mr. Walton had wrongly estimated the question. He did not think it was a question between land and capital. He believed that the income derived from all property should contribute towards the safety which all property required. Mr. Dunn thought that if the rates were collected in any other way than the present system, it would be under the form of an income tax. This country had escaped from the feudal system, but there were still many traces of it left in connection with land.

HAIL STORM INSURANCE.—At the annual general meeting of the General Hail Storm Insurance Society at the offices, in St. Giles'-street, Norwich, the report stated that the past season has been full of vicissitudes operating against insurances generally, but more especially hail storm insurances. Drought, inferior crops, and a general want of prosperity amongst the agricultural classes have tended to reduce the amount of acreage much below that which has usually been insured, but it is a satisfaction to be able to state that although the business has suffered more or less in every county this society has been enabled to add several hundred new insurers to its supporters, so that the falling off of our old customers (which from the above causes, we hope is but temporary) has not been felt to the extent that might have been expected, and we therefore look forward with confidence to regain our old position in the coming season. Another severe trial has been borne by this society, which its ample funds and extended business have enabled it to sustain satisfactorily. Hailstorms during the past season, although they have not been numerous, have been of a more serious character, as to the amount of damage done by them, than at any time during the past 12 years. The absence of ordinary thunderstorms until the middle of June last, when the crops were unusually forward, had caused many to neglect to insure even those crops which were worth insuring; then came the fearful visitations of the 16th and 17th June, and where the latter storm was heaviest, the damage was almost incredible, considering its short duration; one agent who witnessed it wrote immediately and stated that it had exceeded in destructiveness the great hailstorm of August, 1843, and we have no reason to doubt the statement then made, for we paid his clients alone near £2,000, besides other large sums in surrounding agencies, and we heard of many sufferers in the district who were not insured at all, and to convey to our agricultural friends an idea of the extent of the losses, we extract the following items from some of our surveyors' returns of claims allowed by us on this occasion: Wheat, five cases 24 bushels an acre, one 20 bushels, &c. Barley, two cases 24 bushels an acre, six cases 16 bushels, &c. Oats, three cases 20 bushels an acre, &c. Rye, two cases 20 bushels an acre, &c. Peas, two cases 28 bushels an acre, four cases 20 bushels, two 18 bushels an acre, two 16 bushels, &c. Beans, one case 20 bushels an acre, three cases 16 bushels, &c. Potatoes, £3 an acre, &c. These being but a few cases selected from the numerous claims paid by this society alone, it is easy to conclude that the total damage done must have been very great indeed. It is well known that the aggregate number of insurers in all the offices represent only about 15 per cent. of the crops grown, leaving 85 per cent. wholly at the risk of the farmer; that this should be so appears unaccountable, especially as the premium is now reduced to a few pence per acre.

THE PENRITH FARMERS' CLUB.

At a meeting held to further discuss the question of purchasing the freehold of the corn and other tolls affecting the Penrith market, and to consider the desirability of procuring an analysis of certain specimens of limestone selected from the neighbourhood, Sir Henry R. Vane in the chair, the Secretary, Mr. T. Robinson, read over the minutes of several committee meetings, from which it appeared that eighteen specimens of limestone had been selected from the district, and that it had been ascertained the charges of Professor Anderson, Dr. Voelcker, and other scientific men for supplying an analysis were from £1 to a guinea for each specimen.

The CHAIRMAN, whilst regretting that the cost would trench so largely upon the funds of the Club, thought it was very desirable that the farmers of the neighbourhood should be informed as to the quality of the lime they used for agricultural purposes.

Mr. OLIPHANT-FERGUSON was of opinion that the Farmers' Club would not be prepared to spend eighteen guineas, nor half that amount, in procuring the analysis suggested. He thought it was for the owners of quarries themselves to furnish an analysis of the limestone they used.

Mr. HESKETT thought that in adopting the proposal they would only be carrying out a resolution of the Club. Whatever other people might be disposed to do, he thought a certain number of limestone samples ought to be analysed at the expense of the Club, because it was very necessary that farmers should know what they were buying in the shape of lime. Eight, nine, or ten samples might be selected, and he proposed that something like that number should be analysed by Professor Anderson. No more than ten samples need be forwarded for analysis, seeing that of the eighteen specimens some had been selected almost from the same place.

Mr. J. C. SMITH remarked that one of the members of the Club, Mr. McDougall, had promised to select what he called "typical" specimens, in order to avoid the expense of an analysis of rock obtained from the same geological formations. Some of the examples it would be found greatly resembled each other, whilst in others there was a wonderful difference. Mr. McDougall, from his chemical knowledge, would select such samples as differed greatly from each other, an analysis of which would prove of the greatest benefit to the farmers, because whilst some kinds of lime were absolutely beneficial to the land others were poisonous or worthless. He could conceive of no ordinary question of more importance to the farmer than to know whether, if he placed so many cartloads per acre upon his land, it would benefit or injure it.

Mr. OLIPHANT-FERGUSON thought it was as much to the interest of owners of lime quarries to furnish an analysis of limestone as it was for the manure merchants to do so.

Mr. TINNISWOOD said the farmers would derive greater advantage from an analysis of manures, of which they used a much greater quantity.

Mr. T. BOWSTEAD inquired whether the chemist would give an opinion as to the agricultural value of the samples, because it was well known some limes which were the very worst for building purposes were the best for the land.

After considerable discussion it was decided that not more than ten samples should be submitted to Professor Anderson for analysis.

The SECRETARY read a letter from the Duke of Devonshire, the present owner of the freehold of the tolls, who expressed his willingness to sell at such a reasonable price as may be deduced from a fair proportionment of the rental paid by the Local Board, the present leasees, and that he was prepared to consider any specific offer which might be made for the purchase of tolls. In the course of the discussion which followed, it appeared that an unsuccessful attempt had been made by the Local Board to purchase a site for the proposed corn exchange.

The CHAIRMAN explained that the Board of Health appeared to be under the impression that the farmers contemplated purchasing the tolls, whereas it was intended that the purchase should be effected by the Board.

Mr. FAIRER (clerk to the Local Board) said the Board of Health had offered £3,000 for the tolls, but Mr. Mounsey, whilst stating that the offer was greatly below the value he

put upon the tolls, declined to name a sum, and the Board were compelled to withdraw from further negotiation. Mr. Fairer added that the Board were still prepared to offer £3,000 for the corn tolls, the shambles, stallage, and the fair hill, for which they paid a rent of £138.

Mr. HESKETT and Mr. SMITH stated that the offer was below the value of the tolls. Their real value was £3,450.

Mr. HARRISON, in reply to a question, said it would not be prudent to buy a part of the tolls. It would be to the interest of the farmers and the inhabitants of the town that the whole should be secured.

A very long and animated discussion followed, in the course of which it was stated that the present lease had yet eighty years to run, but that in consequence of the introduction of new methods of disposing of grain and agricultural stock the revenue to the Board was gradually decreasing, hence the value of the tolls was depreciating. Mr. Fairer said it was intended that the landowners of the district should pay the purchase money; and when the transfer was effected, the present tolls would be removed. Mr. Smith thought the Farmers' Club was placed in a false position. If the farmers purchased the tolls, he could not see in what way they could ensure freedom from other tolls which might be imposed. Various arguments were used to show that farmers still desired to show grain in sacks, in opposition to the statement that farmers had it in their power to sell by sample, and thus evade toll altogether. Mr. I. Wilson said, twenty years ago Penrith market was larger than at the present day, but that was because farmers now paid more attention to the rearing of stock. After a very lengthy discussion, a committee, consisting of the Chairman, Vice-chairman, the Secretary, Mr. Harrison, and Mr. Thom, were appointed to meet a committee of the Local Board, with the view of ascertaining the precise sum at which the Duke of Devonshire would be disposed to sell the tolls.

THE PRICE OF WHEAT.—The balance of trade—or of Free Trade—has at length become so admirably adjusted that nothing will now send up corn. The yield may be good or bad, the quality excellent or the condition generally inferior, our supplies from abroad may be large or small, they may make rates as high in New York as they do on Mark Lane, and still the millers look on with indifference. One very war which creates consternation in the money market causes little or no change in the corn market. Any time during the last three or four years a careful man might have felt justified in speculating in wheat, and rarely would the result have warranted his so doing. The farmer may, and no doubt will, continue to grow wheat, but he must be prepared to do so at a certain fixed price, as probably no man will do better than one who sends his corn regularly in as it best suits him to thrash it, without caring to look or wait for any turn in his favour. Still it is difficult to see, how when either peace is proclaimed or war extended but that breadstuffs must become dearer. Mars and Ceres are necessarily as opposing interests as France and Prussia.—*The Story of the Year in the extra Number of Gentleman's Magazine.*

THE WILTSHIRE LABOURER.—The following remonstrance has been signed by a number of the leading agriculturists in Wiltshire: "The *Marlborough Times* of January 14, 1871, contained a report of some evidence relative to the condition of the agricultural labourers of Wiltshire, said to have been given by Archdeacon Stanton, before a Royal Commission sitting in London; and as many of the statements in that evidence are totally erroneous and likely to mislead the public as to the rate of remuneration paid to the labouring population of this county, as well as their actual condition, we, the undersigned farmers and others of the county of Wilts, feel it our duty to give them an unqualified denial. And we hereby publicly challenge Archdeacon Stanton to substantiate his statements (if he can), by the production of facts; or to retract what at present we regard as an unfounded aspersion upon the farmers of Wiltshire." It is proposed to present this in person to the archdeacon.

THE WINFRITH FARMERS' CLUB.

At the anniversary dinner there was a capital attendance, Mr. J. J. Bates in the chair.

Mr. E. J. WELD said the pulping of furze was of great importance. He himself had put up a pulping-machine, and as far as his experience went the pulped furze was productive of great benefit, of great advantage to all kinds of stock. Another important matter was the cultivation of root crops. They had during the past year seen a great difference, which it was difficult to account for, in the maturity of the crops. A good deal of this had been owing, no doubt, to the different times of sowing. It was a great point in critical seasons like the present whether they should sow early or late; the subject was a fair one for discussion.

The PRESIDENT passed on to the distribution of the awards of the judges, Mr. C. Kent and Mr. Dowden, as under:

General Crop—First, Mr. T. Randall; second, Mr. Ellis; third, Mr. T. Chapman Saunders, of Watercombe. Highly commended, Mr. Calcraft.

Ten Acres of Swedes—Mr. W. Chick.

Five Acres of Swedes—Captain Farrer.

Five Acres of Mangold—Captain Farrer.

Two Acres of Mangold—Mr. W. C. Lacey.

Ten Acres of Turnips—Mr. Chick.

The PRESIDENT announced that, in addition to the first prize of £5 offered by the Club for the general root crop was a prize given by Mr. Calcraft.

Mr. DAMEN had been rather anxious to ascertain the feelings of landlords on the subject, and regretted from an instance of which he had lately heard that the prejudice against the cultivation of the flax still existed. He had thought that it had long ago worn out. He thought there ought to be no prejudice against it whatever.

Mr. T. RANDALL, the winner of the cup, said that during his experience of 40 or 50 years he had never known turnips lie in the ground so long. The crops, too, had suffered considerably from wire-worm and grub. No man occupying a farm of 300 acres ought to be without a steam cultivator. He had found the greatest benefit from the use of one. On going over his field he could show where the steam cultivator had ceased work, so well was the work done.

Mr. CALCRAFT looked upon it as very interesting to hear what Mr. Randall had said about the steam cultivator.

Mr. T. RANDALL recommended a 14-horse engine for deep cultivation.

Mr. CALCRAFT: You meant, of course, 300 acres of arable land?

Mr. RANDALL: Yes.

Mr. CALCRAFT said: As to the subject of parishes being saddled with the enormous debts of the Turnpike Trusts, and also the maintenance of the roads, he would join in any petition that might be drawn up. He looked upon the proposal to be, if carried out, utterly unjust, and thought it would meet with general resistance, especially as an educational rate was looming in the distance.

Mr. DOWDEN suggested that in future the judges should be allowed to exercise their discretion more than they had hitherto done. The landlords should try experiments for the benefit of the tenantry, as Mr. Weld had done in the pulping of furze. Regarding another subject, he had long been of opinion that there was nothing to beat the steam plough and the steam cultivator, particularly on strong land; light thin soils were not calculated for steam. He thought if Tenant-Right, or if good long (say twenty-one years) leases were secured the difficulty of capital would be met.

Mr. MARKE gave "Success to the Neighbouring Clubs—the Milborne St. Andrew, Blandford, and Dorchester."

Mr. KENT could not bear the idea of anything said to the disparagement of the Milborne Farmers' Club; the only thing to be regretted, he thought, was that the same publicity was not given to it as to the sayings and doings of other clubs.

Mr. CHAPMAN SAUNDERS said his conviction was that the increased taxation must eventually be borne by the landlords. He was pleased, he said, to see that in no less than ten counties the question of the adjustment of rating had been taken

up at Quarter Sessions. Their friend Mr. Randall had attributed his success to steam cultivation; he (Mr. Saunders) believed the day was coming when steam cultivation would be generally introduced. Passing to another topic, he said he did not advocate much amendment of the game-laws; a better understanding between landlord and tenant would do more good than any alteration in that respect.

WEST CUMBERLAND FARMERS' CLUB.

At the annual dinner at Whitehaven, Mr. Jefferson, of Springfield, in the chair, Dr. TOSH read a paper "On the Composition and Value of Oil-cakes." He said the adulterations of oilcakes are, as many of you may know to your sorrow, but too manifold. Water is sometimes added in undue quantity to increase the weight, and sand also for a like purpose. These sophistications are, however, easy of detection on analysis. But by far the most common and the most insidious means of adulteration is that of mixing the pure seeds with cheap innutritious vegetable matter, such as earth nut, acorns, and the like. The presence of such substances is shown on analysis by the poverty of cake in oil, albuminoids, or both, but their specific nature can only be identified by means of the microscope. So common indeed has adulteration of feeding cakes become, that Dr. Voelcker, of the Royal Agricultural Society, gave it as his opinion that upwards of 50 per cent. of the cakes in the market were spurious. Now farmers have the matter in their own hands. If on analysis these cakes can be proved spurious, he is in a position to claim damages. As the adoption of analysis of manures has become more general during the past few years, it is not much to say that the vendors of worthless rubbish under all kinds of high-sounding titles, have been driven almost entirely out of competition. Let the same system be adopted in regard to oil-cakes, and we shall hear fewer complaints.

Mr. R. JEFFERSON (Preston Hows) gave "The Landed Proprietors." He thought the gravest charge against them in the present day was the over-preservation of game. He thought they could not charge the landed proprietors of this part of the county with that; he would be delighted to see a little more game on his own land. The duties of landed proprietors were very numerous, and he did not know whether he dare enumerate them. But he might mention one way in which they could do a great deal of good, and that was by going to the expense of purchasing a good entire horse, and keeping it for the benefit of their tenantry. The same might be said as regarded cattle. If this were done, it would do them all a very great deal of good, because tenant-farmers could not be expected to go to the great expense of purchasing first-class animals at such high figures as they were sold at in the present day.

Mr. STANLEY (Ponsonby Hall) said there was one thing that tenants often failed to do. The landlord as a rule was called upon to pay half the expense of drainage of his land. This he did willingly, but if the men's wages, &c., were reckoned in, it would be found that the tenant paid the larger half. But what he had to complain of was this, that farmers as a rule did not look to their drains and keep them clear; they didn't see that the outlets were clear in the main-fall. He would ask all to think well over that matter.

Dr. CLARKE proposed "The Tenant Farmers of West Cumberland." He felt that tenant farmers did not receive that attention from their landlords which he thought their interests deserved. As far as he had been able to judge, a much greater outlay was necessary on the part of the landowner. The farm steadings, &c., required improving. He had seen, in small steadings, animals of very high value put into premises not fit to put a dog into. That was a point he should like proprietors to take into consideration.

Mr. BORTHWICK said in reference to Mr. R. Jefferson's remarks as to landowners providing good horses for the tenantry, he should rather advise that tenants ought to keep good mares, instead of old hacks. His noble master had kept a bull until he had nothing to do, and then he disposed of it. But he still retained the stallions, and these had little to do.

AGRICULTURAL REPORTS.

SOMERSETSHIRE.

There is not much to report beyond the effects of the severe frosts we have had. It is well the wheat plant was not more forward; it is making less appearance above ground than it has for years, and there are some rumours of its being injured, but these have not been verified as yet. We had frost and rain at the beginning of last week, and on the high ground snow has lain for some days. The large turnips and swedes are much injured, the smaller ones may produce some greens; but this failure of roots has greatly disappointed the hopes of the farmers in helping out winter provender. We have had the reverse of a mild winter, and if we have a backward spring it will be disastrous in no small degree to the stock holders, and must influence the price of cattle-feeding produce. Some few parties have bought in barreners, but there are many who would have done so if they had had keep. There is little complaint of disease amongst the stock; the foot-and-mouth disease has greatly abated, and appears to have nearly run out. As yet stock have not suffered from shortness of keep, looking better now than they are likely to do when two months have passed over; for sheep there is still a worse prospect, and they are already not looking so well as other stock. Winter oats and barley have been cut down, if not destroyed; the same may be said of vetches (there was considerable breadth of land sown). Fat beef and mutton keep up their high prices; but now stock is receding in value the price of cattle-feeding corn is gradually advancing and the consumption increasing, which will be very large for at least two months to come. Pork, which is the cheapest meat, is 1d. to 1½d. per lb. under beef or mutton, being worth 11s. per score and under. The make of cheese last year was short, and prices are likely to be maintained. There is little doing in wool at rather improved prices. At present the price of flour keeps up better than wheat, the large deliveries of the farmers having sent down prices 1s. to 3s. per qr. Want of straw for the cattle also keeps prices down. Holders do not like to store away, and it is offered as soon as thrashed; they were disappointed in obtaining 7s., and now 6s. 6d. to 6s. 9d. per 62lbs. is pretty readily accepted for white, and 6s. to 6s. 4½d. for fine reds; barley 4s. 6d. to 5s. 3d., oats 3s. 3d. to 3s. 6d., beans 5s. 6d. to 5s. 9d., extra 6s.; flour 37s. to 38s. Millers just now hold back, being full. If we attain to the lowest now, we may look for improved prices as we get nearer spring. Potatoes, although some are spoiled by frost, are good and plentiful, and are largely consumed. Hay very scarce; selling at £7 per ton for prime. Wind keeps shifting back to north and east. We had heavy rain last night; now feeling frosty.—Jan. 20.

SOUTH LINCOLNSHIRE.

A month or more has elapsed since the commencement of the severest blast experienced for about ten years. The intense frost of Christmas Eve 1860 did great damage, and was only a trifle severer than Christmas Eve, 1870. At that time nearly all herbaceous plants, trees, shrubs, and garden plants were irretrievably injured, vast numbers destroyed, amongst them many walnut and similar trees. The wheat plants were strong and did not suffer seriously, but the weaker plants in the lens and exposed districts were injured. We trust the satisfactory covering of snow during the late season has proved a sufficient protection. The blast still lingers—now a frost, now a thaw—making the lairage exceedingly bad for sheep upon turnips. Their food, too, has been icy cold, and almost as hard as a stone. The writer was fortunate in having large plots of cabbage and kohlrabi in his turnip field. To this resort was made with very satisfactory results, proving the safety of such provision in seasons like the past. Upon the whole, sheep have done well throughout the blast, and the casualties not great. The lairage was hard and clean from the deposit of snow, and the best dry food the farm could afford was constantly in requisition. In many cases mangolds, from the graves, were freely used; which, being mixed with the frozen

turnips, formed good eatable rations. Cattle have progressed nicely in the fold-yard. Fatted beasts are making great prices. Store cattle are also very dear. The work of the farm, although forward prior to the frost, is now backward. Thrashing, manure-carting, hedging, ditching, draining, and sundry job work have been the employment. The thrashing has been so general as to cause such abundant supplies as seriously to affect the corn markets, otherwise advances must have taken place. We cannot give any definite opinion upon the growing wheat—many fields are not “yet up”—the forward sowings look rather touched by frost, but not seriously injured. Swedes have nearly lost all their leaf, but the common turnips hold their greenness; neither bulbs are injured to any extent, thanks to their thick covering of snow. Potatoes have kept well, and many have been dressed and sent to market, notwithstanding the severity of the weather. Great caution has been taken for their safety in the railway trucks. Seed is already inquired for, and much is expected from Scotland; a change of great benefit to this district. We are anxiously waiting for the final breaking up of the blast so that ploughing, may proceed, as the land is all dry and in good order.

AGRICULTURAL INTELLIGENCE,
FAIRS, &c.

BANBURY FORTNIGHTLY FAIR.—There were a good many sheep, but the trade was dull, the prices realised being from 4s. to 5s. 4d. per stone. The cattle were principally store, and the business done was at late rates.

BOSTON FAT SHEEP MARKET.—A fair show; trade rather more active. Prices, however, remained same as last week—from 7½d. to 8d. per lb.

BRIDGNORTH FAIR.—There was a small show of stock. Beef made from 7½d. to 8d. per lb., mutton 8½d. to 9d., and pork 7d. to 7½d. Pigs were in good demand, and horses sold well.

DUNFERMLINE MONTHLY MARKET.—The stock was about the average, and consisted chiefly of grazing cattle and milch cows. High prices were got for the cows, several of which sold from £10 to £18 each, and met a ready sale. The demand for store cattle was dull, but a few animals changed hands at from £6 to £13. Several lots were left unsold. In the horse department there was an extra supply of all kinds. Sales were rather dull, but large prices were obtained for good animals. Mr. Wilson, Lochgelly, sold three fair horses at prices ranging from £20 to £36 each. Inferior animals were not in great demand, and at the close many were turned out unsold.

FORRES MONTHLY MARKET.—There was a good attendance of farmers and others, and there was a fair supply of stock of all kinds. There was, however, an almost entire absence of dealers from a distance, and on that account business was stiff. A good many lots, however, changed hands in the course of the day. Fat sold at from 70s. to 75s. per cwt. The following are a few of the transactions: A lot of two-year-old queys at £15, and a lot of cross stots for £15 5s., 4 two-year-old cross cattle at £23 10s., a lot of 4 two-year-old crosses at £19, a lot of 6 two-year-olds for £61 the lot, and 1 at £11 5s., 2 three-year-old lots for £39, and 2 yearling heifers at £29, and a cow at £16, also a cow at £12, 2 polled heifers for £31, a bull for £19, and 2 cows for £27, a quey for £14 15s., a fat cow for £30, a pair of two-year-old queys at £19 each, a lot of bullocks at £23 each, and 5 queys at £18 each, and 2 queys at £29 the pair, a cow at £10, and a pair of calves at £10, a pair of six-year-olds at £26, 4 six-year-olds at £15, 8 cattle at an average of £14 10s., 10 three-quarter-old polled beasts at £22, a lot of 6 two-year-old crosses at £25, a cow at £18. No business was done in the sheep and horse markets.

GLOUCESTER FORTNIGHTLY MARKET.—There was a good supply of fat stock. Trade was languid, but prices

only slightly declined. Beef made 7½d. to 8½d., and mutton 8d. to 9d. per lb.; bacon pigs fetched 9s. to 10s., pork 10s. 6d. to 11s. per score, and all were sold.

GRANTHAM FAT STOCK MARKET.—A short supply of beasts, but very plentiful of sheep. Brisk business done, and a good number of buyers present: Beef 9s. per stone, ewe mutton 7½d., wether 8½d. to 9d. per lb., pork 7s. to 7s. 6d. per stone.

LINCOLN FAT STOCK MARKET.—This was a very large market, there being a large show and many customers. There was no beef sold under 10s. per stone, and mutton was from 8d. to 9d. per lb.

MORETONHAMPSTEAD GREAT MARKET.—There was but a scanty supply of bullocks, and sales were dull. The sheep-pens were moderately filled, with better sales than at the late markets. Beef 7½d. to 8½d., mutton 7d. to 8d., pork 7d. to 7½d. per lb.

NEWARK FAT STOCK MARKET.—We had a good market and many buyers, with prices slightly in advance of last week: Beef 9s. to 9s. 6d. per stone, ewes 7d. to 8d., wethers 8d. to 9d. per lb., pigs 7s. 9d. to 8s. per stone.

SLEAFORD FAT STOCK MARKET.—A good show of first-class fat sheep, which met with a brisk trade. A small show of fat pigs, which were quickly sold. A large show of fat pigs, which realized late rates. Ewe mutton realized from 7d. to 7½d. per lb., wether ditto 8½d. to 9d., and half-breds 9½d. to 10½d., beef 10s. to 10s. 6d., and pork 7s. 9d. to 8s. 6d. per stone.

IRISH FAIRS.—**BANBRIDGE:** In the horse department there was a large muster of cobs and hacks, many of which changed hands at prices ranging between £8 and £25; troopers were difficult to find, and brought, in some instances, as much as £45; few hunters were obtainable, and these were valued at £55 to £75; carriage horses brought somewhat similar prices; and young animals rated from £12 to £25. Horned cattle were not so numerous as was anticipated, nor was the quality very superior. Passable fat beasts realised £16 to £25; strippers, £8 to £14; young stores, £8 to £10. Sheep were freely purchased, many fleshy animals going to the shambles for 65s. to 70s.; inferior, 52s. down.

BALLINASLOE: As pigs are down in the English markets, jobbers were rather slow so invest. Mr. Donnelly, of Dublin, purchased 200 pigs at prices varying from £5 to £7 10s.; 40, at from £3 to £6 10s.; 50 do., at from £6 to £7 10s.; 150 at prices varying from £5 10s. to £6 10s.; Mr. Pat. Coomley, of Enniskillen, 180 at from £3 to £3 10s.; 100 at an average of £6; 80, at £6; 150, at from £3 10s. to £4; Mr. Peter Hunt, of Strokestown, 40 at an average of £4 10s. Several large lots were driven home unsold. The supply of sheep was small, and they seemed very slow in demand; not one-fourth were disposed of. At least one-fourth of the cattle were driven home unsold. The horse fair consisted of animals of a most inferior description, ranging at from £8 to £12. Farmers' nags sold at from £7 to £10. The general tone of the fair may be quoted thus: Three-year-old heifers ranged from £13 10s. to £16 10s., two-year-old from £11 to £12, yearlings from £7 to £8 10s., three-year-old wedders from 50s. to 56s., two-year-old, in middling condition, from 45s. to 50s., hoggets from 36s. to 38s., milch cows from £12 to £16, a top lot of stall-feds at £27, and a second lot do. at £19, 50 heifers at £15, 20 heifers at £13 10s., 30 heifers at £14 10s., and 30 ditto at £14, a lot of stripper calves at £13 10s., 20 two-year-old heifers at £13, and 20 do. at £12 10s., 20 do. at £11 16s.

SLANE: In the beef department several excellent lots were offered, both bullocks and heifers, which sold at fully 7½d. per lb. For one fancy lot of fully-finished heifers £24 10s. per head was received, which might be calculated at 75s. per cwt. in sink. These were purchased for the export trade. Second quality rated from 6½d. to 7d. per lb. The look out for store bullocks was brisk, and all were bought up at an early hour by dealers for the English markets. In every case late prices were sustained, as may be judged from the following quotations: Three-year-olds from £12 10s. to £16 10s., according to condition, two-year-olds from £9 to £13 each, yearlings and stirks from £4 to £9 per head. In the springer department of the fair the supply was not equal to the demand. A few good ones reached £16 to £18 each, inferior £10 to £13 10s. Strippers were also in moderate show, but in first-rate demand, selling from £9 to £14 each, according to merit. In the sheep

fair the trade was slack, exporters not having put in an appearance. Prices had a decided downward tendency, wedders of three and four years old going no higher than 8d. per lb. The swine fair presented no feature of interest, further than a fall in bacon and pork of 4s. to 5s. from the quotations of last week.—**PORTUMNA:** Quotations were about the same as those which prevailed at Ballinasloe and the other fairs recently held in the district. Yearling heifers £4 to £8, two years old £7 to £12, fat cattle £10 to £16, or from 55s. to 62s. per cwt., sinking the offal, inferior cattle from 48s. to 53s., hogget sheep 30s. to 38s., wethers 40s. to 55s., or quoted by the lb. on foot, sinking the offal, from 6d. to 7½d. was paid. A few horses were bought up at an average of £20 to £25. The fair altogether was thin and dull.—**TULLOW:** There was a good supply of fat stock, for which the extraordinary prices of from £26 to £30 were given in some instances for bulls. Beef might be quoted at from 65s. to 75s. per cwt. for first quality; second rate 60s. to 65s. There was rather a small supply of stores, for which very high prices were given. In this class the supply was not equal to the demand. Mutton sold at from 7d. to 8d. per lb., with a small supply. Pork might be quoted at from 42s. to 50s. per cwt. Store and bonhams very dear.

LONDON CHEESE MARKET, (Thursday last.)—Trade having been so quiet from the beginning of the year, we have thought it unnecessary to issue a circular till to-day. The change in the weather is acceptable, as it will no doubt tend to some improvement in the cheese trade. The late extremely cold temperature has affected the quality of most of the cheese held in stock, and made it difficult to sell. We have now a fair demand for really prime, meaty, flaky Cheshire cheese, either full-sized or small, and anything tight and of good quality and flavour in lumps is very saleable. Of these descriptions we shall be glad to receive early consignments. American cheese continue to arrive in moderate quantities; at Liverpool the stock is large. There is a fair amount of business doing in the best factory cheese, and prices are firm. Cheese which have gone off in flavour are very unsaleable. The arrivals reported from January 1st to this date are 76,190 boxes.—**CORDEROY AND Co., Mill-lane, Tooley-street.**

GLOUCESTER CHEESE MARKET.—There was a short supply; about five tons were pitched, and it sold readily at from 66s. to 70s. per cwt.

GLASGOW, (Wednesday last.)—We had a moderate supply of cheese, which met with a better demand at fully late rates.

POTATO MARKETS.

SOUTHWARK WATERSIDE.

LONDON, MONDAY, Jan. 23.—During the past week the arrivals coastwise, by rail, and road have been very large, much in excess of the demand, and a considerable fall in prices has been the result. The following are this day's quotations:

Yorkshire Flukes	90s. to 105s.
Do. Regents	80s. to 90s.
Lincolnshire do.	70s. to 80s.
Dunbar and East Lothian do.	75s. to 90s.
Perth, Forfar, and Fife do.	70s. to 75s.
Kent and Essex do.	60s. to 65s.
Do. do. do. Rocks	55s. to 60s.

ALEX. TOD.

BOROUGH AND SPITALFIELDS.

LONDON, MONDAY, Jan. 23.—These markets have been well supplied with potatoes. With a quiet trade, prices have ruled as under:

English Regents	75s. to 95s. per ton.
Scotch Regents	75s. to 100s. "
Rocks	65s. to 80s. "

COUNTRY POTATO MARKETS.—**DONCASTER, (Saturday last):** A large supply of potatoes this morning, and considering the continued prevalence, of severe frost, a better business was done than might have been expected, prices remaining about the same, viz.: Regents 7s. 6d. to 8s. 6d., rocks 6s. to 6s. 6d. per load.—**MALTON:** Table potatoes were nominally quoted £3 per ton, but there were few offering, the bulk being locked up in the pies by the frost, causing scarcity. At the change of weather prices are expected to droop. Retail 6d. to 8d. per stone. **MANCHESTER:** Yorkshire pota-

toes 10s. to 12s., Scotch 7s. to 9s., Cheshire 6s. 6d. to 9s. per 252 lbs. YORK: Though the supplies, owing to the severe weather, are very limited, business was dull, and no advance in price was obtained. The sales were made at from 7s. to 6s. per tub of 280 lbs. wholesale, and from 5d. to 6d. per 14 lbs. retail.

SALE OF SHORTHORNS AT ELLON.—The first of the public sales of Shorthorns, under the auspices of the Ythanside Farmers' Club, was held at Ellon, Aberdeenshire. The weather was stormy, but there was a fair attendance of agriculturists. Nine breeders signified their intention of offering their stock, and the order of the sale was balloted for. The animals offered were only of ordinary merit, the leading breeders in the county being conspicuous in the sale catalogue by their absence. The stock on the whole being only moderate quality, the prices realized were satisfactory. Mr. Thomson, Greenmyre, got the place of honour in the catalogue for his eight young bulls. These were very equal, and seven averaged nearly £22 per head. They were all after Sittyton bulls. Mr. Campbell, Blairton, offered three bulls and three heifers, and realised fair prices. They were after Kinnellar bulls; and the heifer Modesty, taken out by Mr. Valentine, goes back to the breeder of her sire. She was probably the finest Shorthorn sold yesterday. The Meikle Haddo bulls met a fair sale. They were after the Little Haddo bulls Marmaduke and Prince Louis, bred at Sittyton. The highest-priced animal at the sale was Ythan, in Mr. Mitchell's lot, bought by Mr. Davie, Bridge of Alford, for 37 guineas. Mr. Mitchell's bulls averaged about £24 per head, being £1 higher than Blairton's average. Eleven bulls, bred by Mr. Davidson, Mains of Cairnbrogie, averaged about £23 each, and were chiefly after Billy, a Kinnellar bull. Two of the three bulls from Newseat were after a Kinnellar bull, and the other one after a Sittyton bull. Mr. Thomson had the highest average, being over £29 each. One of Mr. Yule's bulls was inferior in point of quality, and three, belonging to different persons, entered at the end of the catalogue, were not sold. Mr. Mitchell, St. John's Wells, Fyvie, was the auctioneer, and Mr. Copland, Mill of Ardlethen, was judge of sale.

BANBURY HORSE SHOW.—The Twelfth Fair, the annual exhibition of horses took place in the Horse Fair. There were 94 entries. Class 1, for cart horses, was not so good as usual. The prize here was taken by Mr. B. Bradshaw, Newbottle; Mr. Z. Stilgoe, Adderbury, being commended and highly commended for his two horses. Class 2, for the cart mares, was on the whole good, the prize going to Mr. Hawtin Checkley, Wykham. Class 3 brought out some capital cart colts, and Mr. Denchfield was first, with a colt got by a horse belonging to Mr. Cook, of Hanwell, with Mr. Harbage, of Steeple Barton, highly commended. It was not so with class 4, for cart fillies, for which there were only two entries, and the prize was not awarded. Mr. W. Fairbrother, Burton Dassett, was first for the best cart colt or filly in class 5. The classes for the hacks and hunters filled very well, and the result was an excellent show. The prize for the best hunter, over six years old, went to Mr. Samuel Gale, Canon's Ashby, Daventry; Mr. S. Berridge, of Drayton Lodge; and Mr. B. Bliss, of Wardington, being respectively highly commended and commended. Mr. W. Manning, Foxley, Towcester, carried off the prize for the best hunter under five years, Mr. Richard Treadwell, Shalstone, Buckingham, being highly commended. For the best hackney, Mr. S. Blunt, Paulerspury, Towcester, had the prize, and was highly commended for a second entry, with Mr. Langton Bennett, Baycott Farm, Stowe, commended. The prize for the best cob went to Mr. J. E. Parsons, Charwelton, Daventry, and Mr. Prophet White, Shotteswell, was highly commended. Jumping the hunters, which has usually taken place at the Cricket Field, Grimsbury, was not attempted on Monday. The judges were Messrs. Elliot, Heathencote, Towcester; B. Percival, London; Newton, Campfield, Woodstock; and Cartwright, Wolverhampton.

YORK CORN MARKET COMPANY.—On Saturday Jan. 14, Mr. Francis Carr, of Heslington, the principal promoter of the Company, and the erection of the commodious Corn Exchange, took the opportunity, as it was the commencement of the new year, to address a few remarks to the Company on the success of the undertaking, urging at the same time the paramount importance of having a covered market

erected in the city without further unnecessary delay. Having pointed out all the advantages to those attending the market, he said what was wanted was the individual assistance of every shareholder in the Corn Exchange Company to assist in the advocacy of a covered market along with the farmers of the neighbourhood generally. They must urge the Corporation, the tradesmen, and the citizens to provide a covered market, and "agitate, agitate, agitate," until they obtained it. After some remarks from Mr. G. Smart and Mr. Henry Richardson, Mr. Peart moved, "That in the opinion of this meeting, and of the members of the Corn Exchange Company, the erection of a covered market in the city of York by the Corporation is not only necessary but imperatively required." Mr. G. Smart seconded the motion, and it was adopted by acclamation.

THE HARES AND RABBITS.—If our readers want to know what hares and rabbits, and gamekeepers, can do, they should read the report of a case which was heard at Shrewsbury Saturday, Jan. 14. Some time in December, Mr. John Groom, as the assignee of the tenant, Mr. William Harding, entered into possession of Haughmound Park Farm, and soon found, we imagine, that he had made a bad bargain. The ground game attacked his grain crops and his roots to a perfectly appalling extent; and "actually came in droves to the sheep-troughs and ate the meat." The damage to the grain crop alone was estimated by Mr. Brewster, of Balderton, and Mr. Mansell, of High Ercall—gentlemen well known to our readers—at £143, besides the destruction of root crops, which was supposed to amount to £3 per diem. Applications to the landlord brought replies allowing £100 for the grain, but declining to entertain the subject of roots. Under this provocation, Mr. Groom was rash enough to attack the game on his own responsibility, and on the 4th instant his brother, Mr. Thomas Groom, went out shooting. The gamekeepers, however, were on the alert, and no sooner had Mr. Groom pocketed a hare, than, to use his own words, they rushed upon him "like mad dogs" and took the sacred animal out of his possession. This was the case as stated for Mr. Groom, and it was contended by his solicitor that as there was no reservation of the game, Mr. John Groom had a right to destroy it, and that, supposing this was not the case, the proper course would have been to summon him, and not to assault Mr. Thomas Groom. The reply, we suppose, was a satisfactory one in the eye of the law; that Mr. John Groom was not the tenant, and that he had acknowledged the landlord's property in the game by applying for compensation. At any rate the magistrates dismissed the charge of assault which Mr. T. Groom had preferred against the keepers; and Mr. J. Groom must be content to watch the game coming in droves to his sheep-troughs and gnawing all the profit out of his root crops. It is necessary to reflect for a moment or two before one can realise that it is England where a man can be treated in this way. A line, however, must be drawn somewhere, even in matters of justice, we suppose, and in England we draw it at game.—*Oswestry Advertiser.*

EDINBURGH AND GLASGOW WOOL SALES, TANKFIELD, Jan. 14.—The January series opened here on the 10th, and closed on the 13th, with my sale at Glasgow. The brokers here offered collectively about 9,000 bales, of which I submitted 4,000, and about 700 in Glasgow. The attendance of buyers was good, and all appeared anxious to do a trade at former rates, but in almost all classes an advance had to be made, prices having improved with the turn of the year. This was particularly the case in Highland wools, the competition for which being remarkably spirited, both here and at my sale in Glasgow, the result of which is that I am again cleared out of Highland wools, both white and laid. In laid Cheviot there was not much done. White Cheviot wethers of good depth were well sold at an advance on last series, as were also bred and half-bred wethers and crosses. Half-bred hoggs are unusually dull, and lower in proportion to wethers than has been the case for years. Short stapled cheviots continue to attract less attention, but on the whole there seems more inclination to buy than for several months past. Prices may be quoted as follows: Bred and half-bred hoggs 15½d. to 18d., ewes and wethers 13d. to 15d.; Cheviot hoggs 13d. to 15½d., ewes and wether 12d. to 15d.; cross hoggs 14d. to 15d.; laid Cheviots, 7½d. to 10½d., and hoggs up to 12½d.; white Highland, 6½d. to 8d., and washed 8½d. to 9½d.; laid Highland 4½d. to 5½d. per lb.—**ROBERT GIRDWOOD.**

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The intense frost with which 1870 closed dipped into the first week of the new year. Then came an ordinary winter's temperature, followed by great mildness and much wet, which has everywhere saturated the ground and filled the reservoirs. As snow for the most part covered the soil when the cold was most severe, we do not hear of damage done to the wheat plant; but where the root-stores were insufficiently protected much has been lost which could ill be spared. It would certainly have been better for vegetation if we had not experienced these fluctuations, which often do mischief; but let us hope we shall yet escape. Prices of wheat have very little varied, the gain of the first Monday being lost on the second, when the thaw set in; and with this state of things our averages have been in perfect accord, the rise both in London and the country being just 6d. per qr.; so we remain much as the year opened. But the all-absorbing subject is this dismal war, which not only threatens Paris, but all France, with desolation, unless pacific counsels get the uppermost in the minds of the ruling powers. With the poor women of Paris brought down to about a penny loaf a-day, dog's-flesh at 8s. per lb., eggs at 2s. 8d., and potatoes 1s. 6d. per lb., and shells bursting over their heads, the wretchedness of two millions of human beings is too deep to be realized, and England does well in her efforts to mitigate it, though there is yet the danger of its encouraging resistance and exasperating the victors. Already a large demand for oats and flour has sprung up, increasing the value of the latter by 2s. per brl.; and, should there be a prompt capitulation, there may be quite a rush on our London market stores, which happen to be well supplied, and ready for the claim; but to furnish only one peck to each inhabitant of the doomed city will require 100,000 sacks. This would, however, give time for arrivals from all quarters, and be the commencement of the misery's end. The tabulated statement of the *Mark Lane Express*, early sent forth this year, confirmed the general report of the grain crops. In no case do we find a record of excess. With the greatest variety in wheat this crop scarcely comes up to an average; while the stock of foreign in the whole kingdom, on the 31st of December, 1870, was 1,351,548 qrs., with 177,847 sacks 286,972 brls. flour, against 2,024,558 qrs. wheat, 156,160 sacks 327,537 brls. flour in 1869. So that we are now considerably less in condition to render help than then; and beyond this fact we have that of Prussia's crop being only three-fourths of an average, and America reporting less by six million quarters. Now, as France was decidedly short before her recent disasters, we are in no case likely to see low prices this side harvest, supposing things to go on in their usual course as respects the growing crops: but as we can never be sure of these, so probabilities are much more in favour of a further advance than otherwise. The following rates were recently quoted at the places named: Wheat at Antwerp 54s. to 60s., white Zealand at Rotterdam 45s. to 45s.; Hambro' prices were 54s. to 57s., at Stettin 52s., at Danzig 50s. to 55s.; Barletta wheat at Naples 57s.; wheat at Petersburg 42s., at Rostoff-on-the-Don 37s., Berdianski 49s., cost, freight, and insurance; Ghirka, 48s., cost, freight, and insurance; best white at San Francisco 43s. 6d., free on board; at Valparaiso 51s., cost, freight, and insurance; No. 2 Milwaukee wheat at New York 51s. per 480lbs., cost, freight, and insurance.

The first Monday opened on very short supplies, both of English and foreign wheat. Very few additional samples were exhibited on the Essex and Kentish stands. The severe frosts having brought a great quantity of ice on the Thames, navigation was too much impeded for ready sales, but with some improvement in the condition of the samples, factors were able to obtain an advance of 1s. per qr. on the price of the previous fortnight. More was doing in granaried foreign, some holders requiring an advance of 2s., but only occasionally this was paid, 1s. being more generally accepted. With few cargoes afloat on offer, full prices were maintained. The frost still holding on for half the week the earlier markets followed London, and generally reported 1s. advance; among these were Hull, Leeds, Sheffield, Spalding, Sleaford, Ipswich Melton Mowbray, Gloucester, Rotherham, Thirsk, &c., but with the thaw a general dulness came on, causing a decline of as much on some localities on Saturday. The only difference for the week at Liverpool was a decline of 1s. per cental on Friday. Edinburgh was quiet for wheat. The price being attempted to be raised at Glasgow prevented sales. Dublin was only firm for both native and foreign wheat.

On the second Monday there was a very small English supply, but plenty of foreign, two-thirds being from New York. Though only a moderated show during the morning was exhibited on the Essex and Kentish stands, the thaw had materially deteriorated the condition of samples, so sales were very difficult at a reduction of fully 1s. per qr. The sale of foreign also was restricted, the change of weather reducing the readiness to buy, and American sorts could only be sold by accepting 1s. less money. Cargoes afloat were also reduced as much, though but few were offering. In keeping with the altered weather the country markets held early, were this week the dullest, and 1s. decline was commonly reported at the first markets, as at Hull, Leeds, Sheffield, Sleaford, Stockton, Newark, Manchester, Lynn, Louth, Gainsboro', &c., and at Barnsley, prices were down 2s., but subsequently Birmingham and Bristol noted a slight improvement. Liverpool was down 1d. per cental on Tuesday, and recovered on Friday. Both Edinburgh and Glasgow were lower 1s. per qr. At Dublin business was quiet, without quotable change.

On the third Monday there was a better, but only moderate English supply, the foreign being again fair, and consisting of about half from New York. The upward tendency which was evinced on Friday when frost had apparently set in, was lost again on the sudden and complete thaw, and only the finest samples of English could be placed readily at the previous prices. The trade in foreign also became quiet, with less doing, though good American were generally held at the previous rates. Floating cargoes were unaltered in value. Prices in the country this week were not equally down, though the whole period was wet and unfavourable to the condition. The utmost reduction anywhere did not exceed 1s. per qr., and that only in a few places, as at Ipswich, Gainsborough, Stockton, Lynn, Melton Mowbray, &c., while Birmingham and Bristol, as well as some other localities, were rather higher. Liverpool was 2d. to 3d. dearer on Tuesday, but not on Friday. Glasgow was 1s. dearer for American samples, but Edinburgh was dull. Dublin

evinced more firmness both in native and foreign qualities.

On the fourth Monday there was but a moderate supply of English wheat, and only one small cargo from New York. The show of fresh samples during the morning from Essex and Kent was small, and the condition for the most part so bad that millers declined buying, but the few dry prime lots offered were taken more readily than on the previous Monday at fully the rates of that day. The foreign trade was very limited, but really fine red American sold at the previous currency; the higher Baltic qualities and lower Russian were but little in request. The best cargoes of floating lots were taken at unaltered rates.

The arrivals in London for four weeks were 20,827 qrs. English, 50,677 qrs. foreign; against 13,124 qrs. English, 58,427 qrs. foreign for the same time last year. The London exports for the same period were 4,431 qrs. wheat, 22,897 cwts. flour. The imports into the Kingdom for four weeks ending 14th January were 3,077,834 cwts. wheat, 447,665 cwts. flour; against 4,482,495 cwts. wheat, 697,618 cwts. flour in 1870. The London averages commenced at 54s. 6d., and closed at 55s.; the general commenced at 52s. 7d., and closed at 53s. 1d., the increase being only 6d. on each.

In the flour trade but little change has occurred, excepting the enhancement of the value of American barrels through a demand for France. Country sorts have come plentifully to hand, and some have been taken on French account, but the fear of their keeping qualities has limited purchases, while a confidence in barrels on this score has sent up their value during the month fully 2s., and foreign sacks have risen about 1s. In Town-made qualities there has been no change, 47s. remaining the top price all through. Though stocks are fair in London the wants of Paris may soon clear them out. The imports into London for four weeks were 86,311 sacks English, 1,385 sacks 74,153 barrels foreign; against 87,930 sacks English 9,714 sacks 21,769 barrels foreign in 1870. The last quotation for extra State at New York was 27s., cost, freight, and insurance, the value here for French account being 28s. 6d.

Of maize the supplies have continued moderate, and values have accordingly improved 1s., the best yellow being worth 32s. 6d., but it is quoted in New York 34s., cost, freight, and insurance, so nothing can be expected thence till after the opening of the canals, when the new crop will become available at easier rates.

The supplies of barley have continued moderate, both in British and foreign qualities, and there has scarcely been any quotable change of value through the month, fine malting being worth about 41s. per qr., but with a slow sale, and fair grinding about 27s., while Saale barley at Hambro' is worth 41s. to 42s., so with a deficient crop and high prices abroad, little foreign can be expected to interfere with prices; but the demand for malt-liquor all through the season has been unusually slack. The imports into London in four weeks were 13,402 qrs. British, 20,959 qrs. foreign; against 16,812 qrs. British, 37,061 qrs. foreign in 1870.

The malt trade has continued very dull all through the month, but prices have ruled about the same. The supplies of oats for four weeks have been extremely scanty, and were chiefly received on the first week; when, however, the only rise, and that but 6d. per qr., took place. Every subsequent week has gone very short, and yet the mild weather has so influenced the minds of buyers that the demand has been very slack, and prices unaltered, even in the face of a large foreign demand; but the fact is that this demand has been chiefly satisfied from the unusually heavy stores now in granary, which holders have

been glad to avail themselves of. Russian 38lbs. have brought 22s., and Swedes of the same weight 23s.; 40lbs., to 24s. 6d. As our own crop was very defective, and English supplies have been increasingly short, we expect some revival in this trade, especially should France further relieve the granaries. The imports into London for four weeks were 1,478 qrs. English, only 151 qrs. Scotch, no Irish, 89,978 qrs. foreign; against 1,880 qrs. English, 147,582 qrs. foreign last year. The exports from London in four weeks were 30,819 qrs.

The supply of beans has been only moderate, both English and foreign, the former quite as good as might be expected after a bad yield. Prices have been steady throughout, the value of good hard new Mazagans 40s., harrows 43s. to 45s., and old 2s. or 3s. more. The relative cheapness of maize has mainly contributed to keep down values, and seems likely to do so permanently, excepting those years of frost or drought, when this plant suffers in its places of growth. The imports into London in four weeks were 3,782 qrs. English, 2,914 qrs. foreign; against 3,083 qrs. English, 3,479 qrs. foreign in 1870.

Though the supply of home-grown peas to the London market has not been equal to half that of beans, yet so slack has been the demand, especially for boilers, that they have receded in value fully 1s. per qr., and this without any foreign imports. The fact is, the stock in granary is yet heavy, compared with the consumptive demand. Duns, however, and maples have been so scarce that they have commanded fully late prices, the former 37s., the latter 44s., foreign white 35s. to 38s., English 37s. to 42s. for extra breakers. The imports into London for four weeks were 1,786 qrs. only, all English; against 2,019 qrs. English, 6,429 qrs. foreign in 1870.

There have been fair but not heavy supplies of linseed, and prices have been fully maintained, with a good weekly sale for cake.

The late high prices for red cloverseed have not been sustained. During the intense frost farmers thrashed their produce, being tempted by prices; so with better supplies buyers became cautious, and values receded, especially on receipt of some from America, of fair quality. Values yet remain above speculative rates, and the short crop will, no doubt, make the article dear all through the season.

Spring tares have been getting into more demand at full prices—say 36s. to 38s. per qr.

**THE CHERRY FACTORY,
AT LONGFORD, DERBYSHIRE.**

PLATE V. LINCOLN WETHERS.

THE PROPERTY OF MR. C. LISTER, OF COLEBY LODGE, LINCOLN.

This pen of sheep took the second prize at the Midland Counties Show, and the first prize in the week following at the Smithfield Club Show in last December, when we said "the Birmingham award was very properly corrected in favour of Mr. Lister, who beat Mr. Harris alike for weight, style, and quality." Mr. Lister's sheep are bred from the stock of the late Mr. Charles Clarke, of Scopwicke.

The more modern Lincoln shows a very strong dash of the Leicester, as in fact there are breeders who, it is said, can exhibit the two sorts from one flock; but at the Oxford Meeting of last summer the Lincolns for the first time were honoured with classes of their own.

PLATE VI. THE CHEESE FACTORY, AT LONGFORD, DERBYSHIRE.

At the annual meeting of the Derbyshire Agricultural Society, in December, 1869, Mr. J. G. Crompton brought forward for consideration the advantages of the American factory system of cheese manufacture. It was shown that English cheese, generally speaking, is considered to be deteriorating in quality, and that the American, on the contrary, is rapidly improving in many respects and taking up the lead in some important markets. Hence it became necessary to do something in order to improve our method, or we should soon have to content ourselves with lower prices and diminished appreciation for our own home-made cheese. It was shown that the Americans have improved cheesemaking almost into a science—elevated it into a profession—the results being apparent in the uniform quality, flavour, firmness, and shapeliness of much of their own recent production. These results were considered attributable to the factory system, that is, a number of farmers banding themselves together and sending their milk to some central and suitable place to be there manipulated under a correct method and with convenient appliances, by an experienced dairyman. By this plan, beyond a better article being produced, a great economy is secured both of labour and material.

Subsequently to the one at Derby, several meetings were held in different adjacent localities, in order to place the scheme distinctly and clearly before the farmers. At these meetings the subject was well ventilated, and, as might naturally be expected, many and various objections were brought against it, but they were mainly from prejudice against innovations, or from non-comprehension of the working of the system. These objections were met by facts and arguments taken from sources on which reliance could be placed, and it was eventually determined on to start two factories in Derbyshire, in order to test the applicability of the system to English dairying districts, and to promote its extension. Longford, a village about ten miles west of Derby, having offered the greatest amount of patronage, was selected as the place where one of the factories should be, and an improved commodious wooden building was erected there at the cost and on the estate of the Hon. E. K. W. Coke. Derby also was chosen for a trial, there being many supporters of the scheme in the immediate vicinity of the town, and Mr. Alderman Roe kindly lent a building in Siddal-road for the first season, which was fitted up with the necessary plant, under the supervision of Mr. Cornelius Schermerhorn, who at the same time superintended the

erection of the Longford factory, and afterwards became its manager.

In order to secure the farmers against pecuniary loss should the project be a failure, and to induce them to give it a trial, a large guarantee fund was subscribed to by many of the gentry of the county. Under this fund 6½d. per gallon was guaranteed for the milk, which price is allowed to be equivalent to 77s. 6d. per cwt. for cheese. These preliminaries having been satisfactorily arranged, the two factories were ultimately started under the management of Messrs. Levi and Cornelius Schermerhorn, experienced American dairymen, the Derby one on April 5th, and the Longford on May 4th, 1870. A large bronze plate with the following inscription is affixed to the front of the Longford factory: *The first cheese factory built in England, opened May 4, 1870, under the management of Cornelius Schermerhorn.* The Longford factory is so arranged that the milk may be received at an elevation sufficiently above the milk vats on the ground-floor to enable it to pass into them from the weighing can without further trouble. The weighing can is situate in front of the building, and the milk is poured into it from the outside. Pipes come from the milk vats to the weighing can, in the bottom of which is a plug valve, to which a small chain is attached coming to the top. When each producer's milk is weighed the valve is opened by means of the chain and the milk passes directly into three vats below. These vats are 15 feet long, 8 feet 9 inches wide, 19 inches deep, and each holds about 600 gallons. The vats consist of an outer case of wood with a lining of strong tin, leaving a space all round and underneath of about two inches wide. When the evening's milk has been received, and pretty equally distributed among the vats, taps are turned on and the spaces filled with cold water, which is running all night, in at one end and out at the other of each vat. Good cold water is very essential to the success of a factory. The water from one of the vats, as it passes out, is conducted by an india-rubber pipe to a miniature water-wheel in the floor to which the "agitators" are attached. This is an ingenious arrangement. The agitators float on the surface of the milk all night, and, by keeping it in motion effectually prevent the formation of cream. The richness, by this means, is all retained in the cheese, and, as there is very little cream on the whey in this method, the "skimming-dish" cannot be said to have robbed the cheese. Part of the butter gathered from the whey is used in rubbing the outsides of the cheeses in the curing rooms, the remainder sold. Morning and evening when the milk is weighed each producer receives a check ticket mentioning his weight of milk in pounds, and the date. When the morning's milk arrives it is added to the evening's pretty equally, and the cold water is replaced by steam from a 4-horse power perpendicular boiler, which stands conveniently in one corner of the room. It is, however, thought that the boiler would be better outside the building, as it makes the room over warm in summer-time. The whole mass of milk is now raised to a

temperature of 80 degrees, more or less, according to the state of the atmosphere, when the rennet and the annatto are added. In the course of an hour or so, when coagulation is sufficiently advanced—that is, generally speaking, when the curd breaks cleanly over the finger—the curd knife (an instrument about two feet long, containing thirty sharp steel blades, set one-third of an inch apart in a frame) is passed to and fro about the mass, cutting the curd into small particles. Steam is now turned slowly on again, and the curd turned gently about by hand, so as not to crush it, for at this stage it is tender, and crushing would release some of the fatness. Gradually, as the whey separates itself, the curd particles harden and toughen, and the whole is kept stirring by curd rakes, until a temperature of 100 degrees is attained. Steam is then turned finally off, and the curd left in the whey until a slight acidity, which is generally two or three hours in developing itself, is perceivable to the smell and taste, when the greater part of the whey is drawn off by a syphon, and passes into the whey tanks, where it remains until what cream there is in it has risen; afterwards it is carted away by the farmers for pig-feeding purposes. The curd is now dipped—that is, one end of the vat is lowered some six inches to form an incline, a "gate" in the end of the vat is opened, and the curd passes into the "dry vat," which stands on a floor some three feet lower than the one on which the milk vats stand: this is called the "drop system," and obviates much lifting. Through the false bottom in the dry vat the remainder of the whey soon drains from the curd; which done, the proper amount of salt—two or three pounds per cwt., according to the season of the year and the state of the curd—is added to, and well mixed with the curd. The salted curd is then measured into the hoops or press vats, and is at once placed in the presses which stand in a row close by. A pressure of some two tons is applied for an hour or two, after which the cheeses are taken out of the hoops, "bandaged," put in again, and a much heavier pressure applied. The bandages are of thin calico, and serve to protect the cheeses while they are curing and on removal. The following day the cheeses are taken to the curing rooms, when they are ranged on benches and dated. The temperature of these rooms is maintained at about 70 degrees, and the cheeses are turned over now and then while they are ripening for sale. The entire process is very simple, free from hazardous complication, and all the labour possible is dispensed with by ingenious and convenient arrangements. During the past season about 2,750 cheeses, each weighing about 56 lbs., have been made at the Longford Factory. The largest amount of milk received in one day was 14,200 lbs., or 1,420 gallons; the largest number of cheeses manufactured 23. The average number of cows has been about four hundred and fifty. The prices hitherto realized for the cheese vary between 82s. and 100s. per cwt. In a factory of this size two good hands, in addition to the managers, are considered sufficient.

On the left of the engraving the three milk-vats are

shown. The whey is being drawn from the nearest one by the syphon. The screw-presses are ranged on the right-hand. A strong wooden "follower" is placed on the cheese in each hoop, and on this the presses are tightened occasionally, as the cheese shrinks by the pressure into smaller compass. On the same floor with the presses the dry vat is shown in the act of receiving the curd from the milk-vat. The pipes which convey the whey to the tanks are placed under that portion of the floor on which the milk-vats stand; but it may be questioned whether flexible guttapercha tubing would not be better in some respects. An economy of room might also be effected by having ordinary cheese-shelves instead of the benches in the curing rooms.

There can be very little doubt in the minds of those acquainted with it that the factory system, that is, concentration, is the best and cheapest on which cheese can be made; but it is open to some doubt whether the particular mode of manufacture carried on at Longford and Derby during the past season is the very best that can be practised in England. Of course the two factories were started experimentally, and in this sense may be pro-

nounced successful; but the cheese they have produced as a copy of American, perhaps is too much so. The opinion is held by some that a modification of the American method, so as to secure a flavour nearly approximating to the best English dairies of each particular district in which a factory is situate, would be an improvement. Thus the distinctive flavour and character of English cheese would be retained. It is also thought that the size and shape of the American cheese may be wisely departed from. These problems will undergo a practical solution during this year with, most probably, beneficial results. On the American method the cheese is made for earlier consumption than most English. It is ready for market sooner. It is *drier*, which is more profitable to the consumer, and as an article of food cannot be pronounced other than very good. In order that factories may be completely successful, the article produced must equal, if not excel, the very best home dairies in flavour and quality. This result may, and ought to be, attained. That done, the community at large will be much benefited by having the cheese average raised to the level of the present best, and by diminished cost of manufacture.

THE WOMAN'S KINGDOM.

An amiable gentleman down in Herefordshire, who calls himself a landlord, and who is something more than suspected of being a priest, has been sneering in print for months past at his own neighbours the farmers, and more recently at their wives and sweethearts. "Ah, Hodge," quoth this reverend man, addressing the labourer, "I wish I could see you, too, set up with a Broadwood, or Collard and Collard," the desire thus expressed being of course a clumsy hit at the tenant of the land for presuming to have a piano on his premises. Now, the sooner this sort of thing is cleared up the better, as our actual progress may come to depend in no small degree upon the position which the farmer and his family are entitled to take. Are they to be considered in intelligence and education but just above the labouring classes, as immeasurably inferior in anything like refinement and accomplishments to the tradesman's daughters or the young ladies at the vicarage? It would certainly almost seem so. At the Farmers' Club the other evening a county member said, speaking to the question of cheese factories, that if these were established the farmers' wives would be deprived of their "little enjoyment": that is, their attendance at the annual cheese fair, where they went to sell their wares "as smartly dressed and as jolly as anybody ever was at a fair." Surely for the nineteenth century this is a somewhat humiliating picture! Is it really to be understood that the farmer's wife has now no higher views, but is the rather willing to submit to a deal of daily drudgery for the sake of a holiday at a fair? where she will stand in the open

street or market-place to haggle and chaffer, dressed out in all her finery, and revelling in such "little enjoyments" as the occasion may offer.

Let us look for a moment on the reverse side of the picture, for it cannot be always fair time. In this very same county, then, the farmer's wife makes cheese twice a day, beginning at five o'clock in the morning, and with the work not over until nine, ten, or even eleven o'clock at night.

Work, work, work!

When the cock is crowing aloof,

And *work, work, work!*

When the stars shine through the roof.

Can it be for a moment maintained that any respectable or reasonable woman would willingly be bound down to such slavery for life as this by the prospect of an outing once a year or so at a fair? And here be it understood that we would wish to regard this question of cheese-factories as one coming altogether within the Woman's Kingdom, as we are almost inclined to regret that ladies were not invited to take part in the discussion at the Farmers' Club. The business is one peculiarly their own, as the proposed reform should interest them all alike. The smaller the holding of course proportionately smaller will be the establishment and the greater the labour of the good wife herself; while on the larger farms the mistress who may have some "touch" on a Broadwood, or who may find some "little enjoyment" in mental culture, has often enough to descend to mere menial's work from the difficulty of obtaining a good dairymaid.

The farmers themselves are fast coming over to this movement, as the experiment in Derbyshire is already a success, while it will be the fault of the farmers' wives if these factories be not rapidly extended. We do not hold to the slightest faith in the attractions of fair-day, as country fairs of this kind are going fast out of fashion, and there is a certain feeling now growing up once more against the statute or hiring fairs. Such coarse revels are at best but relics of an age passing away, and there is scarcely a district but in which these anniversaries are dropping off. When, however, the wife faces her husband with the mournful intelligence that the "old" dairywoman is going to be married, or that the "new" dairywoman won't do, and proceeds to suggest that they should put their cheesemaking out, she may naturally anticipate the reply—Will the new system pay? The whole tenor of the debate at the Farmers' Club, and no where else previously has the subject been considered so closely, went to say that it would. There was not an objection but what was met. One speaker, who made the extraordinary assertion that there was a strong popular feeling in favour of smaller farms, admitted that so far the factory plan would be useful, but that the principle could not be applied in districts in which the dairies were large; whereupon Mr. Jackson, one of the best authorities in one of our best cheese-making counties, expressed his concurrence in the remark that the factory system would be very advantageous to small farmers; but "he was convinced that it would be found of still greater advantage to large farmers—and the whole tendency of agriculture was to make farms larger, and better cultivated." Of course it is, as everybody knows who knows anything of the subject, although this may probably not be the case with a couple of cockney mechanics who are airing their ignorance in a west-country railway carriage. Then, the quality of the cheese is often improved, and its price enhanced; but we would the rather refer the ladies at once to Mr. Coleman's very straightforward paper, the points of which we would

have them to get off by heart, and then to go in a body as a deputation to the landlords, asking them to follow the example of the country gentlemen in Derbyshire, and emphatically protesting against the collateral argument that they think so much of being "smartly dressed," and being so "jolly" at the fair. As we take it, they would infinitely prefer being saved all "the bother" of cheesemaking, if even at the sacrifice of "the little enjoyment" consequent on selling it.

Still, if the wives were relieved of this unwomanly employment, they "would not care how the cows were milked, or whether the cows were clean or dirty, or well or ill cared-for." But why? The more milk the cow gives, the better she is milked, precisely the greater the return, whether the cheese be made up at home or abroad. As for the cows being well or ill cared-for, or being clean or dirty, with all due deference, we shall maintain that this is scarcely woman's work at any time, and certainly not that of a respectable farmer's wife, who in the afternoon is "as well dressed as any lady could desire to be." We must admit that we can hardly make this out. According to Lord Vernon's statement, which nobody ventured to question, the farmer's wife, even in this very Arcadia, is making cheese the first thing in the morning and the last thing at night, and yet she is to be seen dressed like a lady in the afternoon, "happy and comfortable-looking." In Goldsmith's delightful comedy the story turns on the heroine dressing like a woman of fashion in the forenoon to please herself, and like a barmaid or better sort of servant, to please her father in the evening. So with the Wiltshire farmer's wife, who is a lady in the afternoon and a drudge in the evening; or, like Cinderella, who so soon as she hears the clock strike flies from her friends, pulls off her finery, and turns again to scrubbing and toiling. But at the good fairy's instance there is a gallant youth quickly coming to her succour; while this young Prince, whose eloquence is toned to something of a Yankee cadence, is a Lord of companies and factories, as Merchant Princes often are.

THE FARMERS' CLUB.

ENGLISH CHEESE FACTORIES—HOW TO ESTABLISH AND HOW TO MANAGE THEM.

The first meeting of the Farmers' Club for the present year took place on Monday evening, February 6, at the Club Rooms, Salisbury Square, Mr. J. B. Spearing, of Kelburne Lodge, Hirst, near Wokingham, the Chairman for 1871, presiding. The subject for consideration was "English Cheese Factories—how to establish and how to manage them," the introducer, Mr. J. Coleman, of Park Nook, Quorndon, Derby.

The CHAIRMAN said: Gentlemen, as this is the first time that I have had an opportunity of addressing you since the committee did me the honour of electing me to fill the chair, it may not be out of place for me to make a few brief remarks before we proceed to the business of the evening. The subjects which the Committee of this Club have selected for discussion during this year are, I believe, of a most practical and important nature, and they are placed in the hands of gentlemen who will, I am sure, do ample justice to them (Hear, hear). Those gentlemen are, in fact, so well known to all of you that I need say no more on that point. I hope that the coming season will be more profitable and prosperous as regards agriculture than the last two or three seasons have been. The last one has been especially trying to most farmers in all parts of the country (Hear, hear). I hope that the same good feeling which has always characterised our meetings will continue to pervade the discussions. The subject for consideration this evening is "English Cheese Factories—how to establish and how to manage them;" and I feel that I cannot do

better than at once introduce to your notice Mr. Coleman, who I am sure will handle this question in a very practical manner. This subject has not been altogether lost sight of by the Club in preceding years. We have had before papers on dairy management. I find that in March, 1868, Mr. Jackson read a paper on the following question: "Would not the make of English cheese be generally improved by the introduction of cheese factories?" That question has, I believe, been practically answered in the affirmative, and Mr. Coleman is about to show us how to carry out this object (cheers).

Mr. COLEMAN then said: I have been asked to lay before this Club the experience of the past season, in the introduction of cheese factories into England, and as I have taken an active part in the management of the Longford Factory, in Derbyshire (which factory is the first that has been erected in this country), I will do my best to explain the subject; but I must remind the Club that the past year has been an experimental one, and we could not expect to overcome all difficulties in one season, and that season, as all farmers are aware, a very peculiar one. I wish to remind my hearers that we have been engaged in conducting an experiment *in public*—a circumstance which has been decidedly against us; but I will, as far as I am able, lay before you the history of the movement, and leave you to draw your own conclusions upon the subject. I shall allude principally to what has been done at the Longford Factory, a view of which I

have before you, and endeavour to explain the *modus operandi* of cheese making; but, not being a practical cheese maker myself, or even a dairy farmer, you must not question me too closely upon all the technical parts of the subject, or I am afraid I shall break down. The introduction of the factory system into Derbyshire arose in the following manner: In September, '69, the committee of the Derbyshire Agricultural Society, at their dinner, upon the day of their annual show, determined to strike out of their toast-list all, or nearly all, the usual complimentary toasts; and when some of us, who were members of the committee, submitted the list to J. G. Crompton, Esq., the chairman of the day, the first remark he made was, "What am I to talk about? You have taken all the usual toasts out." In answer to this, one of those present replied, "We want cheese factories established, cannot you mention it in your speech and stir both landlords and farmers up? as the Americans will soon beat us out of our own markets if we do not make a move." After some talk upon the subject Mr. Crompton agreed to do what he could, and to that after-dinner speech we owe the introduction of cheese factories into England. I am particular to mention this fact, for there seems to be a notion abroad that a dinner of agriculturists never does any good; and some of our leading societies ignore such a proceeding, but if they will follow the example of the Derbyshire Society and have a practical chairman, and business (not complimentary) speeches, much good will often come out of such meetings. Now comes the commencement of work, and a meeting was called of the members of the Derbyshire Agricultural Society, and a very large attendance was the result, clearly showing that there was a feeling amongst the farmers that something wanted doing, and from the attendance of gentlemen and landowners the meeting augured well for the movement. At this meeting a committee was appointed, and a guarantee fund decided upon, which in a few weeks amounted to upwards of £4,000, showing that the landowners and gentlemen were alive to their part of the work. Rules were now drawn up, different districts canvassed to know where the requisite quantity of milk could be had for the working of a factory, and many minor points decided. The guarantee fund was established to ensure the farmer who sent his milk to the factory a fixed price for his produce, so that in the event of the cheese made in the factory being amiss, or bad in quality, he might not suffer, and the price which he has been paid is 6½d. per gallon (of 10lb.) for his milk, and he has had the whey besides, after the cream has been taken off for the purpose of making butter, and any surplus after paying working expenses is divided *pro rata* with the farmers who supply the milk. The next thing that was settled, was that we must have a town and a country factory; the town one for the accommodation of the public who wished to see the process, and the country one for making a full and fair trial of what could be done. This being decided upon, and Derby being chosen as the situation for the town factory, and Longford for the country one, we had to set to work, as we had at Longford an entire new building to erect, and only about six weeks to do it in; this, however, was accomplished, thanks in a great measure to the exertions of the Hon. E. K. Coke, upon whose estate the factory is situate. Mr. Coke took such a personal part in the direction and management, that every one was bound by his example to do his best. The Derby factory, which is an old building, was at work in April of last year. As soon as we decided upon a factory or factories, the question arose of who was to manage them, and we found we had no Englishman of sufficient experience for the task, and after consulting with Mr. Hayes, of Cary and Co., London, it was decided to have an American manager, who should overlook both factories, and one was immediately telegraphed for. I must here remark, that we are very much indebted to Mr. Hayes for the very valuable assistance he has afforded us, and I think I may go so far as to say, that without his sound advice and great assistance, we should have been in a fix, and I am not sure that we could have got out of it without great loss to all concerned. In February of last year Cornelius Schermerhorn, the American manager engaged for us, came over, and brought with him some of the implements they use in America in the factory; but not one of our oldest cheese makers could understand the use of them; and we were quite at sea as to how to go to work to fit up a factory, but luckily we found Schermerhorn so well up in all the details of the factory system, and having such an intimate knowledge,

not only of the manufacture of cheese, but also of the arrangement of the building, that we soon had things into proper shape, and looked like work. We were also much indebted to the assistance rendered us by Mr. Giles, architect, of Derby, who was the architect of the Longford factory, and who has made the plans now before you. Mr. Giles gave his services gratuitously, so that you see farmers and landlords were not the only ones who helped the movement. The Derby factory started some weeks before Longford, in consequence, as I have said, of its being located in an old building, and was therefore sooner fitted up. As soon as work commenced we found that for one manager to conduct two factories 10 miles apart was impossible, and therefore the guarantors (or subscribers to the guarantee fund) were called together, and they decided to send for a second American manager rather than be beaten, and Schermerhorn's brother was sent for, and in due course arrived, he taking the management of the Derby factory, Cornelius Schermerhorn going to Longford. I may here mention that the Derby factory works up the milk of 300 cows, and the Longford of 500. The factories have been managed by a committee composed of subscribers to the guarantee fund, and some of the suppliers of milk, who have conducted all the business of the two factories, and made rules, effected sales of cheese, and managed everything concerned; and this plan has worked extremely well, and everything has gone on as smoothly as possible, and completely refutes the notion that some persons have, that farmers cannot combine for any purpose. I will now proceed to describe the Longford factory, drawings of which you now see before you. The factory is built of wood, and covered in with asphalt felt, and is placed close to a road, and also a stream, and the receiving-house (A on the plan) is where the farmers deliver the milk, when it is poured by their men into the weighing-can (B), and after being weighed and a ticket of the weight given to the man, it passes down the milk-pipe (C) into the milk vats (D), which stand upon a lower floor, and which are so constructed as to enable us to heat the milk by steam, and to cool it by water, as they have an inside lining of tin and an outside case of wood; the space between the two being that which is used for the introduction of either steam or water, as may be required. In the hot summer months as soon as the milk reaches the vat, cold spring water at a temperature of 52 is turned on, and the animal heat which the milk contains is soon got rid of, and the temperature of it brought down from 94 or 95 to 60, or thereabouts, at which it remains all night. I must now describe the agitators, which are used for the purpose of keeping the surface of the milk in motion during the night, to prevent the cream from rising; this is a most important matter, and one which requires very nice attention. The agitators consist of pendants of wood, with floats attached to them, which floats rest upon the surface of the milk in the vats; these pendants are fixed on a horizontal shaft, and at the end of this shaft is an arm, which is moved by the water-wheel (E), which wheel is worked by the water after it has left the milk vats, and has done duty in the cooling process, and it is now made use of as a motive power for the agitator; a very small quantity suffices for this purpose, and we are perfectly satisfied with the result. I will here remark, that it is very necessary to have cold spring water; in fact, I may say, you cannot make good cheese in hot weather without it. The water is left running through the vats all night, and in the morning the milk fresh sent by the farmers is added, which brings the evening's milk up to the proper temperature, for the reception of the reunit. Now, as I am not a practical cheese maker, I must be excused from going into the exact details of the manufacture, but I will leave that to those who possess more practical experience than I do. When the milk is fully coagulated, and at the time the manager considers best, the curd is cut with the knives being passed gently through the mass. This is done three ways, so as to divide the curd into small cubes. It is then well stirred with rakes made of wood for the purpose, and steam from the boiler is turned on, and the temperature raised to about 100 degrees, or more if thought necessary, and the mass is kept moving. When the curd has been sufficiently cooked (as we term it), the whey is drawn off by means of a syphon, and run into a reservoir, where it remains 48 hours; and the cream, which in that time rises to the surface, is skimmed off and made into butter. After the greater portion of the whey has been, as I have said, drawn off by means of a syphon, the vat is then tipped up, and the discharge port at the end opened, and the curd

and what whey remaining in the vat passes down a spout into the dry vat (F), which stands on a lower floor than the milk vats. Here the curd is turned by hand, salted, and measured into the moulds, and then put into the press (G). It remains in the press until all the vats in the factory are emptied; and then the cheese, as we must now call it, is taken out of the mould or hoop, and has its jacket or cloth put round it, which cloth is of a similar material to that which the Americans use, and is known to all of you. The cheese is then put into the press again, and remains there until the following morning, when it is taken out and passed to the curing room above, and remains there until ready for sale. Such is an outline of the mode of manufacture, and with a boiler (H) for steam purposes, and spring water for cooling, we can bid defiance to any weather, and make good cheese under any circumstances, that is always supposing that we get sweet pure milk delivered at the factory. The delivery of the milk requires close attention, and if it can be cooled down a little in hot weather before leaving the farm-yard, so much the better. I would recommend that two sets of milk-cans be kept and cleaned at the factory, so that the farmer has nothing to do with the cleaning of the milk-tins, but that a clean set be ready for all suppliers of milk to take back twice a day. This we have not yet come to, but I am convinced we shall some day; for if the farmers have got rid of their dairy-maids, who have they that can clean their milk-cans properly? and mischief often arises from this cause. The distance milk will have to travel has been thought by some to be against the factory; but one gentleman, James Brough, Esq., who is both a guarantor and a milk-contributor, has sent his milk nearly five miles, and as he is very particular and has it cooled before starting, it has reached the factory in almost the best condition of any—even in the hottest weather of last year. I will now endeavour to contrast the cost of this method of cheese making, with the present farm-dairy plan in vogue in this country—and I am here open to criticism—but I will state my calculations in such a way that any farmer can see for himself where I err, and how much I am in error; and as the economy of labour is one of our vital points, I shall be glad to hear what any farmer present may have to say upon the subject. I will take a factory of 750 cows, which is the best number, as far as we at present can judge, to work up together. Now suppose this number made up of 30 dairies of 25 cows each (which is above the average in Derbyshire, whatever it may be in other districts), one skilled dairy-maid is employed in each dairy—so that 25 are so engaged, or the farmer's wife takes the place; and at any rate it is proper to value the labour of the wife quite as high as that of the hired servant, and therefore the calculation remains the same.

30 FARM DAIRIES OF 25 COWS EACH.		FACTORY OF 750 COWS.	
	£ s. d.		£ s. d.
30 Dairy Maids;		1 Manager.....	150 0 0
wages, £15 per		2 men, 40 weeks, at	
annum.....	450 0 0	£1 per week.....	80 0 0
Board of ditto, £20		2 lads, 40 weeks, at	
per annum.....	600 0 0	12s. per week.....	48 0 0
		Extra help.....	22 0 0
			<hr/>
			300 0 0
		Gain by Factory.....	750 0 0
			<hr/>
	£1,050 0 0		£1,050 0 0

This calculation gives £1 per cow saved in labour only; now, I have asked many of our Derbyshire farmers what their cheese, with all hired labour, costs them to make, and their estimate varies from 7s. to 8s. per cwt., and if we reckon 4 cwt. per cow as a good average of cheese for one season, this puts the labour at 30s. per cow, whereas in the factory it is less than 10s. I see in the *Mark Lane Express* of last month a Wiltshire farmer says he has to give his dairy maid £20 a year, so that I am quite under the mark when I have fixed the wages of a good dairy maid at £15 per annum, and I do not think such a person can be kept in a farm house for 1s. per day. The factory labour will be no more than I have stated, and if I err, it is in estimating the cost of the present mode of farmhouse manufacture; but this farmers can calculate as they please, and I do not wish them to accept my figures as conclusive. Besides the gain, or saving rather, of £1 per cow per annum there is another very great source of profit, and this is the better quality and the greater

uniformity of cheese made; and I am quite sure that we can command a much higher price than the average of farm dairies can make. I have as near as possible ascertained what our milk suppliers at Longford averaged in 1869, and I find it was 73s. per cwt. of 120lbs.; now, if we allow 3s. as being the difference in value between 1869 and 1870, their average this year would be 76s. As far as the factory cheese has been sold this year the price is 80s. (and, having all the best of our cheese now on hand, we hope to make even more of what remains), this is 4s. above the average of the farm-house plan, and this for a first season, and such a difficult one too! These facts must prove to anyone that our movement is a right one, and only wants to be known to be adopted. We hope to make on an average quite 5s. per cwt. more of the factory cheese than can be made in the farm house (with the exception of isolated cases), and this adds another £1 per cow per annum, or £1,500 a year, clear gain, upon a factory of 750 cows. Some of you may doubt these calculations, but come and see what we are doing as soon as the season commences, and depend upon it you will soon be of our way of thinking. The actual labour at the Longford factory, without reckoning the American manager, has been only £76 7s. 9d., and upwards of 60 tons of cheese have been made. Take the make of English cheese at about 100,000 tons, and save £10 per ton in manufacture and improved quality, there is just a Million to go into the farmers' and landowners' pockets. Some of you may say that I have not named the delivery of milk at the factory, but this you will find a very inconsiderable item when three or four farmers join together for the purpose. Mr. Lownes, of Longford, with a dairy of 44 cows, joins with two of his neighbours, and the cost to him is 4s. per week, or £8 a season of 40 weeks, the utmost duration of the cheese-making season. Not only is the cost of labour much less by a factory than by private dairies, but there is a very great saving by the wholesale purchase of all the articles which enter into the manufacture of cheese; for instance, in our own home dairy I find our bailiff has paid 10s. 6d. per dozen for eirning skins, for which we in the factory have given but 6s. 6d.; annatto, if used, is the same; only one fire to keep up instead of 30, so that the saving in fuel is something considerable. In fact, turn which way you will, you have the same result as is derived from manufactories on a large scale of any article—the more is done, the less the cost. I have made very minute calculations of the actual economy of a factory of the size I name, but I do not think one year a sufficient test, as we may find it necessary to increase our working staff; for we here in England cannot afford to sacrifice the quality of our cheese for the sake of an extra hand to bestow more labour, if necessary, upon its manufacture. I think I have now said enough upon what we have been doing in the past season in Derbyshire, and I will therefore pass on to the establishment and management of factories which landlords, farmers, or others may think proper to start in districts beside our own. Some present may say we in Derbyshire cannot claim the merit of being the first to draw public attention to the want of a factory for the English dairy farmer. This I am quite willing to allow; for I hold in my hand a paper read by Mr. James Howard, M.P., before this Club, in November, 1866, on "Things in America," in which he says: "Dairying is an important branch of rural economy in America. A very novel feature is the introduction of the factory system. In Oneida Co., N. Y. S., there are about 40 cheese manufactories, or 'Associated Dairies' as they are called, having 16,000 cows. I have only time to glance at this subject. The advantages claimed are that the farmer's family is relieved of a good deal of drudgery—that by the employment of a skilful superintendent a more uniform and better quality at less cost is obtained, and, of course, higher prices realized. Messrs. Moore, cheese merchants in Buffalo, told me that for two or three years past their shipments of factory cheese had commanded the highest prices in the Liverpool market." His remarks, as far as they apply to the drudgery of cheese-making in a farm-house are quite correct; and I am sure some of my Norfolk friends would not call us farmers at all but slaves, particularly the female portion of the household. In establishing cheese factories in future, there are two modes which present themselves to our notice: one is the co-operative plan (which to some degree we have adopted in Derbyshire), and the other is the purchase of milk by an individual—who runs all the risk of loss or gain by the manufac-

ture of the milk into cheese. The co-operative plan is the one which we must depend upon for the factory system in its infancy: for this reason, viz., that I find not one farmer in twenty knows the value of his milk, and therefore he will be unwilling to dispose of it at a price which any one could make it answer his purpose to give; and another reason is, that if any one does so purchase milk, it requires a large capital besides what the farmer has employed in his business—and the use of this capital must be paid for, and would form a stiff item of expenses. By the co-operative plan, the farmer who supplied milk, would receive his share of the money made by the sales of cheese; and I must say, no one engaged in agricultural pursuits makes so quick a return—for no sooner has the cow consumed the grass, than it is in the milk-pail, and at the factory, and in six weeks or two months from that time, it may be in the market as cheese. Therefore there is no necessity to introduce a middle man with capital, who would only want to share the farmer's profits; and, small as they are now-a-days, this is quite needless. My advice therefore to those who think of starting factories is to make them co-operative; and I don't see why farmers in other districts cannot pull together as well as in Derbyshire—at any rate, they may if they try, and I think I have shown that the trial is worth making. I will now notice some points which when your factory is started require attention; and the first is to mind that you have an efficient manager, or as good a one as you can get—for if you have 500 cows only in a factory, you are dealing with from 80 to 90 tons of cheese per annum (at the lowest estimate). This, at present prices, means above £7,000 worth; so you see you have a large quantity of a very ticklish commodity, and you must be careful into whose hands you put the management. I am aware that we have very few Englishmen who are capable of running a factory; but as far as we can in the Derbyshire factories, we are willing to teach a young man or two who may wish to learn; and then they must act as tutors to others when factories are started in fresh neighbourhoods. Your manager having been secured, the next thing is to have the right sort of hands under him—young men who can move about quickly and turn work off while some would be looking at it. These must be under the orders of the manager, who will at all times have to be responsible to a committee of management (if there be one) for everything that goes on in the factory. I think some may fancy the disposal of a large quantity of whey a stumbling-block to the factory system: we thought it so at starting, and I cannot say we have quite satisfactorily settled it yet. Our milk suppliers have a certain quantity allotted to each of them, and their water-carts are branded with their contents in gallons, and they send once or twice a week, as the case may be for their share. This has worked pretty well, but has its disadvantages; and one is that at hay or harvest time, and other busy seasons, they sometimes neglect to fetch it away, and this causes loss. The only way is to have proper piggeries at or near the factory, and the consumption of the whey made part of the business of the concern. Each milk supplier can send straw for bedding in the proper proportion, and take back his share of the manure made; this would reduce haulage to a minimum, and make the most of the whey, which will more than pay the working expenses of the factory by the butter that is made from it, if the same be properly attended to; and it is to all such small matters as these, as well as cheese making itself, that the factory manager will have to pay attention; for the many little, that a farmer does not think much of, will amount to a considerable item when seen through the 500 or 750 multiplication table of the factory. Having now finished my remarks upon the subject as it stands upon the card, I will notice a few of the reasons why cheese factories should be established, and who are the persons that would derive benefit from them. I am hearing every day in Derbyshire of the great dearth there is of good dairymaids, and that it is impossible to have the cheese made as it should be, unless the farmer's wife herself attends to its manufacture; and I may say, that in many farm houses the wife has but a hard life of it, and that her children come second to the cheese; this is not as it should be, and I hope we shall have the ladies with us in the movement. Cheese making is not fit work for women, and it very often does them very much harm, from the very bad accommodation the farmhouse dairy very often affords; and in America, as Mr. Howard says, they would not put up with its drudgery; no more will

English farmers' wives when factories are started, and I have no doubt the next generation will wonder how their grandmothers managed to make cheese as well as attend to their other duties, now just as we wonder how our corn would all be thrashed by the flail. You may depend upon it, that when once the farmer has got rid of cheese making from his house, his wife will take good care that she does not have it back again, and small blame to her either. Ever since I have been in Derbyshire I have been finding fault with the mode of farming—it is in general a poor and an exhaustive one, and I have blamed our farmers for not putting manure upon their pastures, but saving all for their meadows; and I have been told over and over again that if they manure their pastures *they will spoil their cheese*. Now, this may be the case or not, but at any rate if it is we must by the help of science in the factory get over it. From what I see of our dairy land in Derbyshire, I am of opinion that it produces less than it did 50 years ago, and in many places is even now going backwards; for we all know that if a dairy of cows form the sole stock on a farm, and have little or no purchased food given to them, that they must soon take the heart out of the land they are kept on, and I have no doubt many practical men will bear me out in this opinion. Another thing a cheese factory will do is, that it will bring more capital on to our dairy farms; and this we want very much, as many of our men are but nominees of the wealthy cheese factor, who advances them money before the cheese is made, and of course fixes his own price when it is for sale. A man of fair standing and ample capital will not have cheese-making in his house, and consequently declines a dairy farm, and looks for a grazing one. I have had an instance of a tenant who has lately taken a farm on the estate of which I have the management, who, although knowing that grazing would not pay near as much as cheese-making, yet preferred the former simply because he had no one but hired servants to attend to his cheese. Landowners who have estates in dairy districts ought to do all they can to establish factories, for if the tenant receives an immediate benefit, we know who will soon participate in the gain; and although there is no need to raise rents now a-days, there is very great need to help the tenant farmer to pay his present rent, to say nothing of rates and taxes, which imperceptibly increase every day. I could give no end of reasons for the adoption of cheese factories; in fact, there is *everything in their favour*, and *nothing* (but what will disappear in practice) *against them*. The principal opposition we in Derbyshire meet with is from the local factor, who sees his trade interfered with, and naturally sets his back up; but we shall manage to get over him and I quite expect to see this class of men set up factories for themselves, and purchase milk instead of cheese of the farmer. If not, we shall simply do without them, and we shall then have no more instances of a Derby cheese factor leaving £50,000 by his will to open the Sydenham Crystal Palace on a Sunday. Call me an enthusiast on this factory business, or what you like, I have said what I think, and those who differ from me now, may when they have seen as much as I have, go farther than I do. I will say no more, but will answer any questions that may be put to me as far as I am able.

Mr. GENGE ANDREWS (Sherborne) as a new member of the Club, and a person somewhat concerned in dairy matters, asked permission to say a few words on the subject which had been so ably introduced. In the first place he must observe that he did not quite agree with Mr. Coleman that taxes were imperceptibly increasing; his notion was that they were very perceptibly increasing (laughter). The question before them must depend very much on the locality in which it was proposed to introduce a cheese factory. Such a factory might be very desirable in a district where the farms were small and the distance the milk would have to be conveyed was not too great; but he did not think whey when once skimmed would bear the cost of carriage for the feeding of pigs. The question of pig grazing was involved in that of cheese factories. On his own farm he kept about 200 cows. They were let to two dairymen, one managing 120 cows and the other 80; he had no doubt that they bought five or six hundred sacks of barley a year on which to graze the pigs with the whey. In a district of that kind, where the dairies varied in extent from 30 to 70 cows, the factory system could not, he thought, be easily carried out. He had conversed with one or two dairymen in his own neighbourhood who milked their own

cows, and he believed they felt that they could not afford to sell their milk at 6½d. per gallon. Mr. Coleman did not touch upon the cost of those elaborate buildings which seemed necessary in order to carry out the factory system. He (Mr. Andrews) could not understand how it was that, with such a great abundance of money, and after such flourishing calculations as they had heard that evening, the public were not rushing into the market to take shares in cheese factories (laughter). He was afraid that practical difficulties must arise with regard to management. They all knew that there was no management so close or so keen as that of a person who had a personal interest in the result; and they had heard from the gentleman who had opened the subject that the factory with which he was connected had to go to America for its first manager. That kind of difficulty had been experienced in the case of all joint-stock affairs. You might get a man as manager who was very clever, but not quite honest, or you might get one who was very honest but stupid and incapable of managing properly; and that practical difficulty required to be carefully considered by farmers before they invested their money in cheese factories (Hear, hear). He could very well understand that in small-farm districts cheese factories might be practicable and desirable, the amount of cheese-making being so small that it could not be conducted with advantage; but in North Wilts, and he thought, generally speaking, in Somersetshire, the dairies were sufficiently large to make cheese of the best quality with the simple management of the farmer's wife and servant, and the formation of factories in such a district would have the effect of breaking up all those dairy establishments. He thought that in the principal dairy districts of England cheese factories would not make way very readily. Another point worthy of consideration was that they all knew there was a very strong popular feeling now, that instead of farms being increased in size, they should be made smaller (cries of "No, no," and "quite the reverse"). They all knew what was now the popular power in England with regard to law-making. The power is in the hands of the mechanic. In coming up from the country the other day he happened to be in a compartment of a railway carriage where two individuals were discussing various subjects, and among them farming. One of them remarked that farms were much too large, and farmers too big men, some of them driving into his town in a gig (laughter). He added, that all that would soon be altered; that there must be a subdivision of farms, and they must have quarter-of-an-acre farms (laughter). "Ah," said the other, "and dairy farmers must have one cow between two of 'em, and milk a donkey and a few ducks." Those two persons looked like mechanics. If they were to have very small farms and such a subdivision of land as was advocated in that instance, factories would become an absolute necessity. No one certainly could make much cheese on a quarter-of-an-acre of land (laughter).

Mr. CALDECOTT (Holbrook Grange, Warwickshire) said he wished to ask Mr. Coleman a question. He said that when milk was sent into a factory, within six weeks or two months it was made into cheese, and the person who sent it got his money. Was Mr. Coleman sure that that statement was correct? Though not a cheese-maker himself, he lived in a county where a good deal of cheese was made, and he should be sorry to buy a cheese which would be paid for within six weeks or two months after the milk went into the factory (laughter). In his district there were a great number of small farms, the occupiers of which had been in the habit of making cheese, and many of them had during the last two years turned from cheese-making to sending their milk up to the London market, whence they obtained their money within six weeks if they dealt with honest tradesmen, which was not always the case. They had found that quick return preferable to encountering the difficulties of getting good servants and of dry seasons.

Mr. RIGBY (Winsford, Cheshire) said, like the preceding speaker, he wished to ask a question. It seemed to him that one objection to the factory system was the difficulty of getting all the milk to the factory in good condition. When a number of persons, united in supplying a manufacturer with milk, some of them would not be so clean in their habits as others, and they all knew that milk soon became tainted if the vessels in which it was placed were not kept very clean, and if sour milk was brought to the factory and mixed with good it would damage the whole mass. He wished to ask Mr. Coleman what the manager of a factory would do in

such cases. He was disposed to view the establishment of cheese factories in a favourable light as regarded some districts of the country, but he agreed with Mr. Andrews, that they were not capable of general application. One objection which occurred to him was, that when large quantities of milk were brought together there must be great difficulty in managing it in all seasons, in consequence of the variable character of the weather. The lecturer remarked, indeed, that in factories they could make good cheese at all seasons; but he (Mr. Rigby) thought it was impossible to make good cheese in the hot days of July, especially when there was thunder in the air, and milk collected in large quantities in the factory.

Mr. ALLENDER (Bayswater) said he was connected with a company for which from seven to eight hundred gallons of milk were brought to London daily throughout the year, travelling a distance not of five miles, as was the case in regard to Mr. Coleman's factory, but of 50 or 60 miles, and it was found in perfectly good condition. To secure that was only a matter of detail which might easily be carried out.

Dr. VOELCKER said he wished to supplement what had been said in favour of the factory system of making cheese. The great secret of sending milk by railway, or any considerable distance, during hot weather consisted in taking out the animal heat, as dairy-men called it, to cool it, and if kept down to 60 or 65 degrees it might be sent almost any distance without being spoilt. He did not apprehend, therefore, that anything of that kind would stand in the way of the establishment of cheese factories. One gentleman had alluded to elaborate and expensive buildings which he considered necessary; but, having seen the factory at Longford in Derbyshire, he could assure them that it was very inexpensive. It was, in fact, constructed on the most economical principles. Indeed it was far too economical to please him. He should like to see what he thought would be a very great improvement in the Derbyshire cheese factory and all other factories that might be established: he meant the introduction of hot-water apparatus in the ripening-room. He did not see how the temperature could be kept uniform without hot-water pipes, and inasmuch as hot-water and steam were required for the ordinary operations of the dairy, with very little additional expense pipes might be introduced in the ripening-room. One of the speakers had expressed doubts whether under the factory system money could be returned to the farmer for his milk within two months. His reply was that that was being done at present by some dairy farmers in Somersetshire; and one of the recommendations of the factory system was that, whereas under the ordinary plan in vogue in Derbyshire, and in parts of Wiltshire, Gloucestershire, and Leicestershire, cheese was not fit for market until after the lapse of five or six months, by adopting the Cheddar plan and carrying it out in all its details, farmers could obtain a very good price for cheese which was not more than six weeks old. It was, in fact, one of the beauties of the system that within a very short time they got by means of it a cheese which though very young had all the qualities of ripe and moderately old cheese (Hear, hear). They had heard a great deal about the American system of making cheese. He thought they ought to take a little credit to themselves, or rather the Cheddar and Somerset men ought to have credit, for having taught the Americans how to make good cheese (Hear, hear). The Americans had the great merit of having established a factory system, and of having adopted and carried out all that had been taught in England, both by practical cheese makers and through the scientific investigations which had been made with regard to the manufacture of cheese. They had had a keen intellect to perceive many causes which operated to spoil a cheese when left to individual judgment in the dairy mode of producing cheese. They had adopted scientific principles which, unless the managers were very careless, could not fail to secure the production of good cheese in factories. If farmers wished to set up a factory he would caution them not to adopt any plan, however highly approved it might be in Wiltshire, Gloucestershire, or Cheshire, but the Cheddar system, because the particulars on which success depended had in that case been so carefully ascertained that an ordinarily careful and active manager, having a sufficient knowledge of the world and of men, must produce good cheese under all circumstances, no matter from what kinds of pasture the milk came, in what weather the cheese was made, or in what part of England the factory was

situated. Those were three very great advantages; and if a factory-manager could produce good cheese at all times of the year, in every locality, and from every description of land, he could easily compete with individual dairy-farmers who were far more dependent upon local circumstances over which they had no control. He was almost afraid to detain them on matters of detail; but he would like to point out a few particulars showing how much depended on the exercise of great care in the manufacture of cheese. Almost every step in the management of cheese had to be carefully considered beforehand. It might seem a very simple matter to add rennet to milk, but it required a great deal of experience to know what quantity of rennet should be added and of what quality it should be. They might spoil a cheese at once by using rennet of bad quality. A good manager would at once know how to proceed in procuring his stock of rennet. The importance of that was shown by the fact that if a single bad vell were used in making rennet the whole cheese would be spoilt, and a man who was paid a handsome salary as manager could not plead any excuse for such a result. A bad vell was like the fly in the apothecary's ointment, and it was the business of the manager to guard against it. Then, in adding rennet to milk it was necessary to be very careful as regarded temperature. If the temperature were too high the cheese was apt to get hard; if it were too low the cheese was apt to get soft. Under the Cheddar system rennet ought to be added at a temperature of about 80 degrees, and a manager had to see that that precise temperature was secured. They could never get a number of dairy-maids to attend to such particulars, for they could not see the importance of doing so; but when a large amount of money was at stake, a manager who was responsible for the result might fairly be expected to attend to them. Then in breaking-up the curd they had to be very careful not to hasten the operation too rapidly. Then, again, if the temperature of the vat in which the curd, partly broken up, was placed, were raised too suddenly the curd became unequally scalded; whereas if they raised the temperature gradually to about 100 degrees, taking care that it did not exceed that, the result would be uniform. That was another great advantage of the Cheddar system. Then, again, in ripening cheese they gained a great advantage by putting a large quantity of cheese in a properly-constructed ripening-room. In many farm-houses the ripening-rooms were badly ventilated, and in such places it was impossible to make good cheese. Perfect ventilation was essential to success. Further, if in a room in which cheese was kept the temperature sunk below 60 degrees the cheese could not become properly ripened; and, on the other hand, if the temperature rose above 75 degrees the cheese became bad; it was then apt to bulge out and did not ripen uniformly. In a small dairy it was impossible to pay proper attention to such particulars, but in a factory there was no difficulty whatever. With hot-water pipes they could maintain a uniform temperature of about 75 degrees—the proper temperature for the ripening-room—for weeks together. These were some of the advantages to be secured in dairies in which large quantities of milk were operated upon; and as large quantities of milk were not always attainable, the sensible plan was for farmers to join together to establish a factory either on the co-operative plan or on any other plan which might be found most advantageous in practice. He could not help adding that he thought it would be well if in the immediate neighbourhood of cheese factories piggeries were provided. He thought the whey ought to be consumed near the factory, pigs being fed with whey mixed with barley meal or something of that kind (cheers).

Lord VERNON said that was the first occasion on which he had been present at a meeting of the Farmers' Club, and he must say that he had never heard a discussion which had interested him more than that to which he had listened that evening. He felt special pleasure in hearing a paper from Mr. Coleman, whose assistance had been so invaluable in Derbyshire in promoting the success of the movement there. That gentleman had very correctly stated the manner in which the movement originated. He said it was suggested in some after-dinner speeches; and it occurred to him (Lord Vernon) that some of their friends might think that if they arrived at such a pitch of wisdom in these after-dinner speeches, they must be wonderfully clever when they were sober (great laughter). Mr. Crompton, Mr. Coke, and some other members of the committee, by the energy and close attention

which they had devoted daily and almost hourly to the work, had contributed much to the placing the movement on a sound and secure footing. The difficulties of arriving at anything like a correct judgment as to how they should proceed were exceedingly great. They had nothing to guide them in this country except the written opinions of Dr. Voelcker, with regard to the composition of milk and the manufacture of cheese. And here he (Lord Vernon) maintained that the improvement in the manufacture of cheese originated with Dr. Voelcker's writings in England, the Americans having been wise enough to profit by them, when the English farmers would not take the trouble of examining what Dr. Voelcker had said (Hear, hear, and cheers). That there was a necessity for this movement was quite evident from the remarks of retail dealers, who could tell them that for one ton of Derbyshire cheese, which they sold in that county, they sold 8 or 9 tons of American. When he was in Cheshire the other day, he was told, in a general sort of way, that the case was the same in Cheshire; and, that there was a much larger sale of American cheese in that county than of Cheshire. He could quite confirm what Mr. Coleman said with regard to the assistance which had been rendered in this matter by Mr. Hayes, the eminent London cheese-factor. Mr. Hayes assisted them in getting an American over at a moment's notice; and he certainly secured for them at the Longford factory a most respectable and excellent servant. A gentleman had made a remark with regard to the cost of buildings. Probably he was not aware that the cost was between 30s. and 40s. per cow. Taking the larger amount, the cost for 500 cows at the Longford factory was £1,000, and he thought he might venture to say that the cost of a private dairy per cow was double that rate, or £4 per cow. Dr. Voelcker had referred to several advantages connected with the manufacture and ripening of cheese on a large scale, which could not be had in a private dairy. One of the greatest advantages, in his opinion, was the manner in which landlord and tenant were brought together to work out that great problem (Hear, hear). He never could have anticipated that any committee, whatever might be its composition, would work so harmoniously, so energetically, and so thoroughly to the point, as they did from first to last. That was not, however, confined to Derbyshire. There were movements of the same kind going on in different parts of the country for the manufacture of other kinds of agricultural produce, and whether they were carried on upon the co-operative system or on some other plan, they could not fail to foster good will in many important matters. Another advantage of the factory system, was the total emancipation, if he might use that expression, of the farmers' family from the slavery and servitude of cheese-making. He trusted that the improvement among the dairy farmers would keep pace with that which was going on among other classes of society, and that the female members of the family would be freed from the horrible state of existence to which they had been hitherto subject (cheers). He believed that if that movement went on, its social effects would be quite as great as its financial ones, and he hoped that the improvement which had within his recollection, during the last 20 years, taken place in the character of the Derbyshire farmer, would be quite as much, if not more marked in the next five years, if the factory movement went on. That it should go on, he felt as sure as that to-morrow would follow to-day (cheers). It was one of those great movements which as having a small beginning, ramified all over the country. Whether or not they beat, as long as they equalled, the Americans in the manufacture of cheese and the sale of it in this country, was not, he thought, very material, for he was satisfied that there was room for them all (cheers).

Mr. H. CHEFFINS (Easton Manor, Dunmow) said he could not help remarking that so completely were the English factories following the example of the American ones that they were making cheeses of the same size and shape, and even wrapping them up in similar cloths. As regarded price, Lord Vernon said that American cheese fetched 7½d. per lb., but Derby was retailed at 10d. per lb.

Mr. G. JACKSON (Tattenhall Hall, Chester) said he could not express his sense, of the admirable and business-like manner in which gentlemen in Derbyshire had put the factory-system to the test (Hear, hear). He admired their public spirit; he admired the excellent feeling which they had displayed throughout. They had met with considerable opposition, especially from the cheese-factors; and great obstacles had been thrown

in their way. Although he was a cheese-factor, and his son was also one, he must say that a large portion of the factors had seemed to fear for their vocation. They had seen the same kind of fear over and over again in this world; and they had found that, after all, nobody seemed to be much injured when any great general improvement had taken place (Hear, hear). He supposed it was not an absolute necessity that all cheese-factors should bring up their sons to their business, and in his opinion opposition to this movement on their part was very short-sighted (Hear, hear). The subject had been so exceedingly well brought before them that evening, that all present were already placed in a good position for forming a fair judgment; but having been the first to bring it before the agricultural world, he would venture to say something about his own experience in this matter. Finding that no one else would take up the thing, and finding it impossible to get good dairy-maids and to make good cheese, he determined to convert his own milk on the factory-principle, and establish a factory chiefly for the use of his own milk. In some respects, perhaps, that separate action was an advantage, because he had entire control, though he had bought milk and might perhaps buy more another year. He could honestly state that the result of his own experience during the last year was most favourable to the factory system. One object which he had in view was to get rid of the disagreeableness of having the dairy servants mixing with his ordinary servants, and that, too, was an object in which he had succeeded. It had been remarked by a preceding speaker that the factory system would be very advantageous to small farmers. In that he concurred, but he was convinced that it would be found a still greater advantage to large farmers (Hear, hear). A large farmer must either make his wife a dairy slave, or he must engage a dairymaid. There was great difficulty in getting a married man to manage a dairy, and the employment of a single one was attended with evils. They were driven, in fact, to employ a single woman, who was probably comparatively inexperienced at the commencement, and was very likely to get married after two or three years (laughter). That was one of the necessary evils: if she got good wages some one was almost sure to marry her before long. The large farmers of Cheshire could not obtain a good dairy-maid for less than about £25 a year. Taking everything into account, he was convinced that where 50 or 60 cows were kept, large farmers would gain more by having cheese factories than even small farmers would gain. He was confident that such was the case (Hear, hear). It had been objected that there must be considerable difficulty in getting milk brought sweet to the factory. It was true that unless the cans were kept very clean, there must be that difficulty; but all his own cans were well scalded and cleaned before they left the place, and he had never experienced any difficulty of that kind, though some of the milk was brought from a distance of two miles (Hear, hear). The summer of 1870 was one of the worst summers that he remembered for keeping milk, and yet he was enabled to keep his milk from Sunday morning till Monday morning, cheese never being made on Sunday during the whole of the hot weather. He had, indeed, an excellent spring of cold water at a temperature of from 50 to 52, and as soon as the milk was brought in the process of cooling commenced; with that assistance he had no difficulty in keeping milk which accumulated from Sunday morning till Monday morning, during the whole of last summer. Lord Vernon had remarked that a very large quantity of American cheese was sold in this country. It was, indeed, very surprising to what a large extent American cheese had now displaced English. At the same time that showed what a vast amount of cheese must be eaten, for nearly all the cheese made in this country was all sold; not indeed, at 10d. per pound, for he should like to know what farmer had sold his cheese at that price. He was quite sure that the Cheshire cheese did not last year reach on the average 70s. per cwt., and he was surprised to hear Mr. Coleman say that 72s. or 73s. was the average in Derbyshire.

Mr. COLEMAN repeated that the average price made by the suppliers of milk to the Longford factory in 1869 (where this cheese was made in the farm-house) was 73s. per cwt. of 120lbs.

Mr. JACKSON said, in connection with the advantage of cheese factories to large farms, he must express his strong opinion that farms would be made larger than they are (Hear, hear). He believed that the whole tendency of agriculture was to make farms larger and better cultivated, and they could

not be better cultivated without being increased in size. While the factory system would benefit the farmer, it would, in his opinion, be equally advantageous to the landlord. Whatever increased the amount of profit the land yielded, must in the end benefit the owner, and he believed that the landlord would reap the greatest advantage (laughter). It would, however, be only a fair and proper advantage. The tenant got the first advantage; but, whatever raised the value of the produce must ultimately increase the value of the land (Hear, hear).

Sir GEORGE JENKINSON, M.P., said he was very loth to take part in that discussion, but feeling considerable interest in that question as a landowner he wished to make a few remarks. It so happened that the farms which he possessed in Wiltshire and Gloucestershire were all dairy-farms, and every shilling of his rent was paid by dairy-farmers, and therefore the Club would easily understand that that subject was one in which he took considerable interest. There was one point which he was surprised had not been mentioned that evening, because it seemed to his mind a very important point. The gentleman who read the paper truly remarked that the process of cheese-making tended to exhaust the land. He quite agreed with him. No man who owned dairy-land could do otherwise than feel that. But it must be remembered that, under the present system, the exhaustion took place, although everything in the shape of whey and pig-feeding was, under the present system, returned to the land. But what would be the case when nothing of what was taken away was returned to the land, when every particle of milk went to a distance of 20 or 25 miles. After the milk was gone the farmer and his wife would have nothing on earth to do, not a pig or a calf to feed with milk, and nothing of the produce to put on the land (laughter). Although that state of things might in the first instance affect only the landowner's pocket, they might depend upon it that it would ultimately affect the occupier's pocket as well. With regard to that item of pigs, what was a man to do if he could not keep a pig because all the whey went off the farm? He knew at least one large farmer in Wiltshire who during the year used to fat 1,000 pigs from the whey of some 70 to 80 cows, buying in at least 2,000 sacks of corn. If such a man sold all his milk to a factory, what was to become of his land? He thought that subject ought to be looked at in a practical way, for it was only through that that any good could arise from the discussion of it (Hear, hear). The factory system had been tried at Swindon, but it was found not to answer. He had heard reasons assigned for that, and one in particular, which he should not give. It was important to consider how far the factory system was applicable to different localities. It might very well be that, in a new country like the United States, where all the relations of life differed in a very great degree from those which existed in this country, where the distances to be traversed were immeasurably greater than here, where everything was on a large scale, and where labour was difficult to secure, the factory system was the best; but it did not follow that it would be the best for England. A great deal had been said about the slavery of farmers' wives under the present dairy system, Lord Vernon having concurred in that view of the question. Now, knowing as he did a great deal about the work on dairy farms, that kind of language seemed to him a little singular. If Lord Vernon were to go to a farmer's house in his (Sir G. Jenkinson's) part of England, in the afternoon he would see the wife as well dressed as any lady could desire to be, although she had been previously occupied in the dairy. On the great cheese-fair day at Chippenham, anyone might see the farmers' wives come there to sell their cheeses as smartly dressed and as jolly as anybody ever was at a fair (great laughter). A cheese factory would take away that little enjoyment from them. If they had no cheese to make they would have none to sell, and therefore no enjoyment on the cheese-fair day (laughter). Living as he did in a dairy-farm country, he must say that the proposed change would make a great revolution in the system of farming. Some people had obtained a character for making a particular kind of cheese, and many farmers felt great pride in the fact that their farm was celebrated for its cheese. He knew two or three farmers, tenants of his own, who made famous cheeses, and the factory system would tend to destroy the *amour propre* of such men. As regarded the question of statistics, they all knew that differences of pasture affected the quality of cheese; how would it be if the milk derived from a number of different pastures were mixed together? If,

for instance, some came off good land, well manured, some off poor ill farmed land, and he asked that in order to obtain information, imagining that a difference of pasture might spoil a cheese. In making these remarks his sole object was to promote the cause of agriculture by eliciting information; but he could not see how it could advance agriculture to do away with the old system of cheese-making, which supplied the great motive-power to so many farmers, and gave an interest to their wives. Under the factory system farmers' wives would not care how the cows were milked, or whether the cows were clean or dirty, or well or ill cared for.

LORD VERNON: Allow me, sir, to ask Sir George Jenkinson one question. Is it not the case in Wiltshire that farmers' wives make cheese twice-a-day, and that the morning make begins at 5 o'clock, and the evening make does not end till 9, 10, or 11? (Hear, hear)

SIR G. JENKINSON: I have no doubt that they do make cheese twice-a-day; but I assert this, that, taking as a limit a farm in Gloucestershire or Wiltshire, with 60 cows, I will show Lord Vernon, if he will come there, as well-dressed happy, and comfortable-looking wives in the afternoon as he could wish to see (laughter).

MR. GENG ANDREWS, who rose amid cries of "spoke," begged to state that cheese was not generally made twice-a-day in North Wiltshire. There it was made only once-a-day, and the process was generally over by 11 o'clock.

MR. S. SIDNEY (Islington) did not pretend to know anything about cheese-making, but having heard the arguments of Sir George Jenkinson against the factory system, he must say that similar arguments were equally applicable to the introduction of steam in manufactures (Hear, hear). The question of cheesemaking depended entirely on profit (Hear, hear). If the farmer found that, by sending his cheese to a factory he could make more money than by keeping it at home, all the sensational and all the sentimental arguments of Sir George Jenkinson would go for nothing (cheers). No doubt it would be a very sorrowful thing if farmers' wives had, like ladies of fashion, nothing to do with cheesemaking, but he had no doubt that they would be able to console themselves under such a dispensation (laughter). With regard to the exhaustion of the land, he thought that agricultural chemistry and all the studies which they had been pursuing for years in reference to the manufacture of manures, would have done very little for them if, when for the sake of profit, they had made a vacuum with one hand they could not fill it with the other (Hear, hear).

MR. H. M. JENKINS (Secretary of the Royal Agricultural Society of England) said, having devoted a great deal of attention to that subject, he wished to make a few remarks. In reference to what Sir George Jenkinson had said on the whey question—a question which seemed to be most difficult for English farmers to understand. The American system of cheese-making had, it must be admitted, considerable advantages over some of the dairy systems in England—not over the best. But in what did these advantages consist? Under the American system, as in England, there must of course be whey. The Americans did not throw their whey into the rivers, but gave it to pigs or calves; and it was simply a question for agreement between factory owners and the farmers who supplied them with milk whether those who supplied the milk should take the whey back to the farm, or whether they should have pigs or calves near the factory to consume the whey there. In either case the whey would not be lost, but would return to the land; and he did not see, therefore, what difference the factory system could make in that respect. Having visited Wiltshire, specially to investigate there the question of cheese making and the adaptability of the factory system to different districts, he must say that he thought he had seen some of the best dairies there and also some of the worst. He had there seen cheese making at the lowest point and in the most primitive fashion, and he had also seen the most refined applications of mechanical science. Therefore he did not think it could be shown that in Wiltshire farmers' wives were as a body either free at exceptionally early periods of the day or employed for an exceedingly large number of hours. But this he must say, that however jolly farmers' wives might be, however much they might like the excitement of the cheese fair, or however proud they might be of their fat cheeses, when he

came to talk to them he found that they would be very glad indeed to get rid of the bother of cheese making (cheers).

MR. J. K. FOWLER (The Prebendal Farm, Aylesbury) said he came from a dairy district where the land was too good for cheese making, and where the difficulties connected with the making of cheese and butter, so well described by Mr. Coleman, had led many farmers to give up making them. In fact, the manufacture of both had almost entirely ceased in his neighbourhood. In the vicinity of Aylesbury there was a large manufactory for making condensed milk; hundred of gallons were sent there every week, and afterwards either sent abroad or used in this country; and in that way they had got rid of the difficulties and troubles mentioned by Mr. Coleman. Formerly his household was entirely upset by the process of butter making, which lasted from eight in the morning till perhaps eight or nine in the evening. In fact, the work seemed never completed; and whatever Sir George Jenkinson might say about the smartly-dressed farmers' wives of his district, he could not help thinking that they would be glad to give up dairy-work. As regarded the making, not merely of cheese but even of butter, he felt certain that the having the work of manufacture concentrated in one place would prove far preferable to the old system, under which it was impossible to make the most of the milk. In a paper which he read in that Club on the influence of the railway system in connection with agriculture, he alluded especially to the fact that in neighbourhoods whence milk was sent to London pigsties were abandoned, and observed that it behoved the owners of the soil to provide some other means of replenishing it. He was censured at the time for saying that, but he still retained his opinion, and perhaps Mr. Jackson would bear him out that bones had been most successfully used in Cheshire.

The **CHAIRMAN**, in summing up, said the discussion appeared to him to have been a very useful one. Nothing which Mr. Coleman had said would justify the supposition that he wished to compel farmers, who were fond of cheese-making, to give it up (Hear, hear). They all knew that there were many farms in this country which were better adapted for producing cheese than for anything else, and in such cases the occupier might still desire to devote his personal attention to cheese; but on the other hand he knew cases in which a farm would produce two or three hundred more a year in that way than any other, and yet the occupier would rather forego that additional profit than have all the trouble of cheese making, and it seemed to him very desirable that such persons should have an opportunity of sending their milk to a factory (Hear, hear). He really thought the introduction of cheese factories would be a great advantage to this country.

MR. COLEMAN then replied: He said he was very glad to hear the remarks of Mr. Fowler with regard to what had occurred on the rich dairy land of the Aylesbury district.

MR. BRYAN WARD (Drayton), begged to tell Mr. Coleman that on the best lands of Leicestershire they made the best cheese. It was, indeed, so good that it was eaten as fast as it could be made.

MR. COLEMAN continued: Sir George Jenkinson seemed to fear that cheese factories would bring about a revolution in England. He could only say that in the Midland Counties the revolution would not come too soon. Farmers there were saying every day, "Pray tell us how the cheese factory system works." Sir George Jenkinson spoke of a farmer in his district who kept 1,000 pigs and 70 cows. The utmost amount of whey that the pigs could obtain in that case was a pint a day, and therefore it was of little consequence whether the whey was used or not. There would be quite as much manure for the land under the factory system as under the old system; and the labour of carting could not be very great. He hoped that during the next season Sir George Jenkinson would do him and his friends in Derbyshire the honour of paying them a visit in order that they might show him what they were doing, and afford explanations with regard to the factory system on the spot. Mr. Jackson had put a question to him with regard to hot weather. As he stated in his paper, he had the advantage of cold spring water, and he could not get on without it. Mr. Cheffins had questioned him about the price of American cheese. His paper had reference not to American but to English factories, and he begged to say that last October he sold at Leicester at 84s. per cwt. two tons of cheese, which was at the time only eight weeks old. It was made in August, and sold on the 11th of October. Although

they had employed an agent who came from America, they were not going to adhere precisely to the American system. The system which they followed was in fact Dr. Voelcker's, and they would do their best to improve it. One of the largest buyers of cheese in the West of England told him a few weeks ago that he was tired to death of going into Somersetshire to buy cheese, because he never got two dairies alike (Hear, hear). He believed that the larger the dairy was the more beneficial the factory system would prove to farmers. He wanted to see a class of men occupying land who would take a pride in its management, and in keeping it in good condition, and not think merely of the quality or the shape of his cheese (Hear, hear). As to the mixing of different qualities of milk—a point upon which some gentleman wished for information—he begged to say that that was the very thing that was wanted to make cheese what it ought to be. One man's milk had too much cream in it, another's too little, and the mixing of the two together made a much more saleable cheese. In reply to Mr. Caldecott's question respecting the time required to send cheese to market, he would only say that on the 21st of June last year he purchased cheese made in America on the 7th of May, and took it home for his own consumption. That was only six weeks from the time of its being made.

On the motion of Mr. T. HORLEY, seconded by Mr. J. TRASK, a vote of thanks was given to Mr. Coleman for his introduction; and the proceedings terminated with a vote of thanks to the chairman.

NEW MEMBERS.

Elected January 2.

R. Daubairn, March.
G. B. Gregory, M.P., Boarsell House, Hurst Green.
T. Hazard, Blackheath.
B. Hodges, Minster, Ramsgate.
M. G. Nockolds, 46, Southampton Buildings.

Elected February 6.

The Rev. J. J. Bumpstead, Goschen House, Guildford.
W. Bushell, Rowling, Wingham.
C. Matthews, Glenely House, Wolverhampton.
Caledon G. Du Pre, M.P., Wilton Park, Beaconsfield.
A. Rogers, Bromham, Bedford.
T. L. Senior, Boughton House, Aylesbury.
M. Sutton, Junr., Reading.
S. Wentworth, Burghclear, Newbury.

THE CHEESE FACTORY SYSTEM.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I have felt much interest in the discussion of the Cheese Factory System by the Farmers' Club. Great good must necessarily arise from such vital topics being freely ventilated, and the thanks of the agricultural world are due to the reader of the paper for the able and lucid manner in which he illustrated the various heads. Much interest must also be felt by farmers' wives and dairy-maids as to the results, and not least by the rural swains who may have a covetous eye towards those blooming damsels so gallantly and humorously described by Sir George! That a great deal of bad cheese is made in this country cannot be denied, and some alteration and remedy is absolutely necessary in order to maintain the position of our home made. Since the 10s. 6d. duty was taken off foreign, the price of English has increased 60 to 80 per cent.; our home produce is all consumed; and, in addition, we pay the foreigner annually 8,000,000 sterling for cheese and 7,000,000 for butter, and still there is an increasing consumption; so that any system that will give us more quantity is worthy the consideration of the tillers of the soil. Germany and Denmark excel us in butter, and if more care is not taken, and something speedily done in regard to cheese-making, Holland will take the lead of us in this also. Foreigners are alive to their interests, and Englishmen cannot afford to lie on their oars, but must be up and doing. I regret, however, that Mr. Coleman should have wound up with such a fallacious statement. No such amount as £50,000 was left by a cheesefactor to the Crystal Palace Company, and

it is a well-known fact that the actual amount willed was not got from the cheese trade, but by some lucky *land* and *stock* speculations, in which the gentleman referred to dealt heavily and was most successful (except in his pet Crystal Palace hobby). Such remarks tend to throw dust in the farmers' eyes and lead their minds from the main points; besides, Mr. Coleman should have remembered that the firm has been the greater portion of a century in existence, and it is generally allowed that careful, hard-working men succeed, *or ought to do*, after half a century's trading. The farmer borrowing from cheesefactor in anticipation is a deplorable system, and one that the factors would willingly get rid of, for such farmers glut the fairs with the cold, raw, secondary cheese; and if Mr. Coleman will walk through any fair late in the day he will find the "unsold" dairies the very lots he describes as being mortgaged to the factors, the latter preferring to risk the money already advanced rather than lose an additional sum by taking to a lot of bad cheese.

Your obedient servant,

JOHN HOWARD, Junr.

PLEURO-PNEUMONIA. — At the Council Chamber Whitehall, the 16th day of February, 1871.—By the Lords of Her Majesty's Most Honourable Council. Present—Lord Privy Seal and Mr. Forster.—The Lords and others of Her Majesty's Most Honourable Privy Council, by virtue and in exercise of the powers in them vested under the Contagious Diseases (Animals) Act, 1869 (in this order referred to as the Act of 1869), have issued an order to take effect from the 16th day of February, 1871, according to which, where a local authority is authorized by the Privy Council to put in operation this provision of this Order, such local authority may cause all cattle affected with pleuro-pneumonia within their district to be slaughtered. This order is subject to certain provisions, among which are the following: The local authority shall, by way of compensation for every such animal, pay to the owner thereof such sum, not exceeding £20, and not exceeding one-half of the value of the animal immediately before it was affected with pleuro-pneumonia, as to the local authority seems fit. Where any animal has been slaughtered in pursuance of this Order, the owner thereof shall not be entitled to recover in respect of the insurance thereof any sum which, together with the payment which he receives for the same under this Order, would exceed the sum which he would have been entitled to receive in respect of the insurance. Where a local authority is authorized by the Privy Council to put in operation this provision of this Order, such local authority may from time to time, with the view of preventing the spreading of pleuro-pneumonia, make regulations for the following purposes, or any of them:—For prohibiting or regulating the movement out of any field, stable, cowshed, or other premises, of any cattle affected with pleuro-pneumonia, or of the carcasses of any cattle which have died or have been slaughtered in consequence of being affected with pleuro-pneumonia. For prohibiting or regulating the removal of hay, straw, litter, or other thing commonly used for food of animals, or otherwise for or about animals, that has been in the same field, stable, cowshed, or other premises with cattle affected with pleuro-pneumonia. Provided that such local authority shall from time to time define the area within their district within which any such regulation shall have effect, and they may from time to time revoke or alter any such regulation. Where a local authority is authorised by the Privy Council to put in operation this provision of this Order, such local authority may, from time to time, with the view of preventing the spreading of pleuro-pneumonia, regulate or prohibit the holding of any specified market, fair, auction, sale, or exhibition of cattle within their district, and may from time to time alter or revoke any such regulation or prohibition. Provided that the Privy Council, if satisfied on inquiry, with respect to any regulation or prohibition made by a local authority under this Order, that the same is of too restrictive a character or otherwise objectionable, may direct the revocation thereof, and thereupon, as from the time specified in that behalf by the Privy Council, the same shall cease to operate. Expenses incurred by a local authority in pursuance of this Order shall be defrayed out of the local rate.

THE POTATO PLANT.

BY CUTHBERT W. JOHNSON, F.R.S.

At a season when potato planting is about to commence, it will be useful if we examine some lately-reported experiments with several manures applied to this crop. Other questions also, such as the size of the sets, and the distance between the rows, are well worthy of the attention of the cultivator. It will be well if we previously examine the chemical composition of the potato plant, before we proceed with our inquiry as to the result of dressing the soil with certain saline and other manures. The potato plant was, some years since, very carefully analysed by the late Professor Johnston and Mr. Fromberg, and from the result of their labours it appears that the composition of the plant varies very considerably at different periods of its growth. Thus they found that the amount of starch and fibre in the young potato—viz.: in 1, the ash-leaved kidney; 2, Buffs from Midlothian; 3, the same Buffs, a fortnight later; 4, an early potato from Renfrewshire—was as given in the following tabular statement (*Trans. High. Soc.* 1845, p. 648):

	1.	2.	3.	4.
Starch	9.52	5.53	7.51	9.14
Fibre.....	4.23	4.53	4.69	4.87

In the case of some cuttings of the Buffs planted in a field in 1846, the diminution of the proportion of starch was remarkable :

	May 30.	June 13.
Starch	5.50	0.05
Fibre	2.35	1.51

The quantity of starch and fibre in four varieties of the ripe potato—viz.: 1, Red from Lanarkshire; 2, Cups from Argyleshire; 3, Buffs from Midlothian; and 4, White from do.—was found to be (*ibid.*, p. 650):

	1.	2.	3.	4.
Starch	14.08	15.14	14.89	14.32
Fibre.....	4.58	4.53	4.45	4.96

By keeping, the proportion of starch diminishes (probably by conversion into sugar and gum). M. Payen found in the same variety per cent., in

October	17.2	January	15.5	March	15.0
November ...	16.8	February ...	15.2	April	14.5
December ...	15.6				

The general average composition of the varieties of the ripe potato, examined by Mr. Fromberg, was, per cent. (*ibid.*, p. 670):

	Natural state.	Dry state.
Water	75.52	—
Starch	15.72	64.20
Dextrin	0.55	2.25
Saccharine matter (impure)	3.30	13.47
Albumen	1.41	5.77
Casein		
Gluten		
Fatty matter	0.24	1.00
Fibre with coagulated albumen	3.26	13.31

The proportion of water in the potato varies in different parts of the bulb and in different specimens. The following analysis of four specimens show this—

Rose end	80.07	76.56	71.97	82.60
Middle	73.77	75.30	79.91	85.13
Heel end	65.33	71.78	74.64	74.30

He found also the same difference in the amount per cent. of starch (*ibid.*, 596).

	Belfast rounds.	Reds.	Kidneys.
Rose end	19.15	16.42	14.84
Centre	14.40	13.73	13.87
Heel end	18.70	20.93	17.48

The average produce of starch in 1846 was—
In the natural state 15.72
Dry (free from water)..... 64.20

It is evident, however, that the amount varies in different soils.

	Midlothian.	Forfarshire.
Buffs	14.89	20.71
	Argyleshire.	Midlothian.
Cups	15.14	23.82

The average composition per cent. of the ash or inorganic portion of the potato tuber is: 1. Calculated with; 2. without carbonic acid (*ibid.*, 1847, p. 683)—

	1.	2.
Potash	43.10	52.40
Soda	3.20	3.88
Lime.....	1.80	2.20
Magnesia	3.17	3.85
Oxide of iron	0.44	0.53
Sulphuric acid	15.24	18.50
Phosphoric acid ...	8.61	10.45
Chlorine	4.81	5.84
Silica	1.94	2.35
Carbonic acid	18.29	—

The composition of two varieties of the potato top, in their natural state, obtained from the same field, is, per cent., as follows (*ibid.*, 686):

	White Buffs.		Red Buffs.	
	Stems.	Leaves.	Stems.	Leaves.
Water	91.51	84.99	88.65	84.29
Inorganic matter ...	1.67	2.39	1.52	2.48
Organic matter	6.82	12.62	9.83	13.23

The composition of the ash of the leaves of the red Buff potato, at successive stages, was found to be (*ibid.*, 688)—

	June 13.	June 27.	July 11.
Potash	8.43	24.12	11.80
Soda	9.50	5.49	—
Chloride of Potassium	15.69	23.10	16.29
————— Sodium	12.04	—	—
Lime.....	28.88	18.59	38.27
Magnesia	2.98	2.32	7.08
Oxide of iron	2.64	5.10	4.20
Sulphuric acid	7.15	6.40	9.23
Phosphoric acid	6.25	10.58	10.84
Silica	6.45	4.30	1.39

From an examination of the mineral matters or ash of the potato, we should naturally feel inclined to conclude that a dressing of a mixture of the salts of potash with superphosphate of lime would be a profitable application to the crop. Now this conclusion has not only been confirmed by some valuable experiments instituted by Professor Voelcker, to which I shall presently advert, but by the experience of a considerable Ross-shire grower of this root. For at a meeting, a few months since, of the Wester-Ross Farmers' Club, Mr. Sim, when addressing his brother cultivators observed (*Farmers' Mag.*, vol. 64, p. 66) that of all crops the most marked results of top-dressing were obtained from potatoes; he found by actual experiment in 1868, that it increased the crop by one-fifth; and in a recent conversation with a brother farmer (who has been for years a grower of potatoes), as to the amount of manure he applied, he informed me that he never used less than six cwt. per acre, and he believed that it would pay to give more. He found a mixture of Peruvian guano one ton, potash one ton, and best dis-

solved bones two tons, to suit him best. That he applied 4½ cwt. of this mixture when planting, and 1½ cwt. when earthing up.

And again it is noteworthy that these substances are all found in farm-yard dung, which in almost all trials with potato dressings has commonly produced the best results. The following is the analysis of two specimens of farm-yard manure, by the late Mr. Nesbit (*Jour. Roy. Ag. Soc.* vol. 7, p. 214). No. 1 being from Kent, and No. 2 from Surrey :

	1.	2.
Per centage of ash.....	9.2	9.6
Silica.....	79.79	71.32
Potash.....	3.32	5.14
Soda.....	0.92	1.68
Lime.....	6.90	12.32
Magnesia.....	0.56	0.82
Common salt.....	1.43	1.22
Phosphate of iron.....	2.04	2.03
Phosphate of alumina.....	1.53	3.54
Sulphuric acid.....	1.89	1.57
Phosphoric acid.....	1.58	1.27

The superior results obtained by the use of farm-yard dung for potatoes are alluded to by Professor Voelcker in his valuable report on various field experiments on this root (*ibid.*, vol. 6, p. 395, N. S.). As he well remarks, "on light land and in a dry season, rotten dung produces a beneficial effect upon vegetation which cannot be expected to follow from the use of artificial manures. Apart from the direct supply of fertilizing matters a fair dressing of dung incorporates with the land a large amount of decomposed organic matter, which possesses in an eminent degree the power of absorbing, and retaining moisture in the land. For this reason dung is particularly useful on land which, like many poor lands, suffers much in a dry season."

Then again, the best time for the application of saline manures to potatoes is of very considerable importance. On this head the Professor remarks (*ibid.*, p. 397). "I am more and more constrained to look upon all very soluble manures as rather dangerous agents, for I have noticed over and over again the injury which these kinds of fertilizes produce in dry seasons, especially if they are applied rather late in spring. Unless common salt or potash salts can be applied to the land quite early in the spring or at all events not later than the beginning of March, I believe it would be better in nine seasons out of ten not to make any use of these very soluble matters, which require to be thoroughly washed into the soil, if they are to benefit the crops for which they are used. It was when commenting upon the following experiments that the Professor was led to make these remarks, viz :

"Potato experiments with dung and various artificial manures made in 1867 by Mr. Hetherington, at Carleton, Carlisle. The following manuring scheme was adopted in these experiments :

Plots	Name of Manure.	Quantities used per Plot of 1-20 of an Acre.	Produce per Plot.
1	No manure	193½ lbs.
2	Mineral superphosphate	22 lbs.	266½ "
3	Good Dung	1 ton.	636 "
4	{ Mineral superphosphate and Crude potash-salts	22 lbs. 22 "	{ 426 "
5	No manure	246 "
6	Crude potash-salts	22 "	426 "
7	{ Common salt and mineral superphosphate	22 " 22 "	{ 303 "
8	Common salt	22 "	221 "
9	Good dung	1 ton.	770 "
10	No manure	225 "

"The land upon which the experiments were tried was a very sandy light soil, in a poor agricultural condition, and of a uniform character throughout.

"The potatoes were planted on the 23rd of April, and the manures were mixed with twice their weight of finely-powdered soil, and sown by hand during showery weather.

"The potatoes on the plots manured with dung made a rapid start and grew luxuriantly, whilst the unmanured plots, and all those dressed with artificial manures, came up sluggishly, and throughout the abnormally dry season of 1867 looked stunted, and evidently not doing well. The potatoes on plot 7, manured at the rate of 4 cwt. of common salt, more especially had an unhealthy, shrivelled appearance, which I have noticed several times before as the result of a dressing of salt on potatoes in a dry season. The roots were taken up in October in dry weather and carefully weighed.

"The variations in the weight of the produce from both the unmanured and, especially from the dunged plots, are rather larger than it is desirable they should be, but not greater than they are usually found to be in unpropitious seasons in similar experiments.

"The following Table gives the weight per acre of the crop of potatoes :

Plots.	Names of Manures used.	Total.			
		Tons.	cwts.	qrs.	lbs.
1	No manure	1	14	2	6
2	Superphosphate	2	7	2	10
3	Rotten dung... ..	5	13	2	8
4	{ Mineral superphosphate } { and crude potash-salt... }	3	16	0	8
5	No manure	2	3	3	20
6	Crude potash-salt... ..	2	4	2	6
7	Common salt	1	19	2	6
8	{ Superphosphate and } { common salt... .. }	3	10	0	20
9	Rotten dung... ..	6	17	2	0
10	No manure	2	0	1	0

The next series of experiments were made in 1867 in the garden at Benthall Hall, near Broseley, by Mr. George Maw. They are valuable, as not only showing the effect of applying different manures, but of using different sized sets, although, as Professor Voelcker truly remarks (*ibid.*, p. 402), "the whole tenor of these experiments appears clearly to indicate that they were made in too rich a soil, and the details of these experiments, which are not altogether void of interest, are reported as a striking example, showing how much careful labour is thrown away in a great measure when manuring experiments are carried out on land in too high a condition of agricultural productiveness."

The Professor, in introducing Mr. Maw's report, adds : "The sets were all planted between April 6th and 10th, and the number of sets per acre was always 21,780 ;" and he further adds :

"An elaborate series of experiments with crude potash-salts, mineral superphosphate, farmyard-manure, common salt, and mixtures of superphosphate and potash-salts, and superphosphate and common salt, was carried out in 1867, by my friend and former pupil, Mr. G. Maw.

"Potato sets of the King of Fluke potato, similar weight (each set separately weighed), were used with each of the experiments which were tried in the garden of Benthall Hall, and uniform conditions insured as far as possible.

"Mr. Maw carefully noted down the detailed results of his laborious experiments, which he incorporated in the following table of the trials with King of Flukes, planted

1 foot in the row, 2 feet apart, (the outer row not in the Experiment), rows 70 feet (Sets) in length :

Weight of Set.	Weight of Sets per acre.				Gross Produce per acre.				Weight of Manure.
Oz.	Tons.	cwt.	qrs.	lbs.	Tons.	cwt.	qrs.	lbs.	
8	4	17	0	26	14	3	0	21	No manure.
6	3	12	3	19½	13	12	3	12	
4	2	8	2	13	12	6	1	26	
2	1	4	1	6	8	11	2	11	
8	4	17	0	26	12	13	1	18	4 cwt. min. superphosphate.
6	3	12	3	19½	11	8	1	27½	
4	2	8	2	13	11	15	0	6	
2	1	4	1	6	9	1	0	9	
8	4	17	0	26	9	14	1	24	20 tons rotten dung.
6	3	12	3	19½	11	1	3	6½	
4	2	8	2	13	14	10	0	26	
2	1	4	1	6	9	15	2	20	
8	4	17	0	26	16	2	0	9	4 cwt. min. superphosph.
6	3	12	3	19½	16	10	2	10	
4	2	8	2	13	16	0	0	14	
2	1	4	1	6	11	11	2	18	
8	4	17	0	26	13	5	2	7	4 cwt. crude potash-salts.
6	3	12	3	19½	13	7	1	15½	
4	2	8	2	13	14	1	0	1	
2	1	4	1	6	10	4	3	18	
8	4	17	0	26	10	10	1	1½	4 cwt. per acre of common salts.
6	3	12	3	19½	14	17	3	2½	
4	2	8	2	13	14	5	3	12½	
2	1	4	1	6	10	15	1	13	
8	4	17	0	26	11	13	1	12	4 cwt. min. superphosph.
6	3	12	3	19½	13	14	2	20	
4	2	8	2	13	14	8	3	3	
2	1	4	1	6	10	5	2	16	
8	4	17	0	26	11	8	1	27½	4 cwt. common salt.
6	3	12	3	19½	17	19	0	17	
4	2	8	2	13	15	14	0	6½	
2	1	4	1	6	11	8	2	26½	
8	4	17	0	26	15	9	3	19½	No manure.
6	3	12	3	19½	13	0	2	22½	
4	2	8	2	13	15	9	0	22	
2	1	4	1	6	9	15	3	19	
8	4	17	0	26	9	5	3	23	4 cwt. min. superphosphate.
6	3	12	3	19½	19	8	3	20	
4	2	8	2	13	12	12	2	6½	
2	1	4	1	6	11	9	3	23	
8	4	17	0	26	22	0	2	9	20 tons of rotten dung.
6	3	12	3	19½	12	11	2	9	
4	2	8	2	13	15	10	0	19	
2	1	4	1	6	13	2	0	4½	
8	4	17	0	26	13	4	1	11	4 cwt. crude potash-salts.
6	3	12	3	19½	12	12	3	6	
4	2	8	2	13	13	17	0	12½	
2	1	4	1	6	11	7	0	4	
8	4	17	0	26	13	1	1	6½	4 cwt. common salt.
6	3	12	3	19½	13	15	3	16	
4	2	8	2	13	14	18	2	0	
2	1	4	1	6	12	9	1	17	
8	4	17	0	26	11	15	0	20	4 cwt. min. superphosph.
6	3	12	3	19½	8	13	3	5½	
4	2	8	2	13	12	17	2	18½	
2	1	4	1	6	9	19	3	7	

I will only give one more series of experiments reported in the valuable communication of Professor Voelcker, who says (*ibid.*, p. 412): "In conclusion, I have the pleasure of reporting on some extremely interesting and successful experiments on potatoes, which my friends Messrs. Coleman and Hull undertook for me in 1869. They were tried on light land, which, however, was in a good agricultural condition.

Each plot was planted with Victoria potatoes, on the 19th of April, 1869, and the crop harvested on the 15th of October, and weighed on the same day, when the following results were obtained :

"The following Table shows the kind and quantity of manure used in potato experiments, made in 1869, at

Easrick Park, Home-farm, near York; the produce calculated to the acre :

Plots	Description of Manure.	Quantity of Manure per Acre.	Produce per Acre.		
			Tons.	cwts.	lbs.
1	{ Mineral superphosphate	4	}	cwts.	12 5 40
	{ Crude potash-salts	2			
	{ Sulphate of ammonia ...	2			
2	Rotten dung	20 tons.			11 5 40
3	{ Mineral superphosphate	4	}	cwts.	8 9 12
	{ Potash salts	4			
4	No manure	—			6 15 80
5	{ Mineral superphosphate	4	}	"	10 15 0
	{ Potash-salts	2			
	{ Nitrate of soda	2			
6	Peruvian guano	4 "			9 9 72
7	{ Mineral superphosphate	4	}	"	7 6 88
	{ Common salt	4			
8	Rotten dung	20 tons.			11 2 56
9	No manure	—			6 7 56

The two unmanured plots yielded on an average 6 tons 11 cwts. and 68 lbs. per acre; and the two plots to which rotten dung was applied on an average 11 tons 8 cwts. and 104 lbs. On the 14th of July, adds the Professor, the field presented the following appearance :

"1. Strong luxuriant plants; colour of tops, dark green; to all appearance the best of the experimental plots.

"2. Good healthy plants; colour of tops good; nearly equal to Plot 1.

"3. Weak tops, of a pale sickly colour.

"4. Nearly equal to Plot 3, but tops a better colour.

"5. Strong healthy plants; dark green tops; nearly equal to plot 1.

6. Strong healthy-looking plants; colour of tops darker green than on any of the other plots.

"7. Very small weak tops, and of a pale yellow colour; apparently the poorest plot of all.

"8. Good strong healthy plants, and very regular in the rows.

"9. Plants very regular, and appearance about the same as Plot 4.

"A casual observer could readily distinguish the plots upon which nitrogenous manures had been used from the others, by the dark green colour which the potato-tops on these plots presented. On the other hand, he would at once recognise the parts of the field to which potash-salts, and especially common salt, had been applied, by the pale green colour of the tops.

"The plots manured with potash-salts did not look very promising at first, but they subsequently recovered and yielded a good increase, although the tops throughout the whole period of growth were paler in colour than on the unmanured portions of the field. On the plot which had received 4 cwts. of salt, in addition to 4 cwts. of superphosphate, the potatoes made no way, looked pale and sickly, and yielded only an inconsiderable increase over the unmanured plots. A glance at the last Table shows :

1. That the greatest increase was obtained by applying to the potato crop per acre a manure composed of 4 cwts. of mineral superphosphate, 2 cwts. of potash salts and 2 cwts. of sulphate of ammonia. This application produced the large crop of 12 tons 5 cwts. and 40 lbs. per acre, and gave an increase of over 5½ tons of potatoes over the yield of the unmanured plots.

"2. That next to the compound artificial manure used on plot 1 dung had the most beneficial effect upon the potato crop.

"3. That mineral superphosphate and potash-salts, without sulphate of ammonia, yielded much less increase than the same mixture with sulphate of ammonia.

" 4. That the addition of nitrate of soda to superphosphate and potash-salts has a less beneficial effect than the addition of sulphate of ammonia to the same fertilising agents.

" 5. That a compound artificial manure, suited to the requirements of the crop intended to be raised, and to the character of the soil to which it is to be applied, frequently has a better effect than Peruvian guano.

" 6. That common salt, applied to potatoes in considerable quantities, rather injures than benefits the crop.

" A general review of all the recorded experiments on the potato crop, if I am not mistaken, warrants the conclusion that on light land excellent crops of potatoes may be grown at a comparatively small expense by means of artificial manures, consisting of superphosphate, potash-salts, and sulphate of ammonia, and that on heavy land, in a good agricultural condition, sulphate of ammonia

may be omitted from a potato manure, either altogether or in part, and that on such land a small quantity of nitrate of soda, added to superphosphate, generally has a better effect than sulphate of ammonia."

The important questions which are briefly alluded to in this paper are all well worthy of the serious consideration of the potato grower. The most profitable size of the sets reported upon by Mr. Maw, has for some years engaged his attention. The composition of various top-dressings, the best period for applying those manures, the value of the salts of potash, either applied by themselves or mixed with other fertilisers, are amongst the valuable researches to which the reader's attention is in these reported trials well directed. The general results he will note are very encouraging, and will well prompt him to continue his readings in that great book of nature whose pages extend over every farm.

FOREIGN AGRICULTURAL GOSSIP.

Annexed is a statement showing the receipts and shipments of wheat at Milwaukie for the thirteen years ending with 1870, inclusive :

Year.	Receipts. Bushels.	Shipments. Bushels.
1858	4,876,171	3,994,213
1859	5,580,681	4,732,957
1860	9,108,458	7,568,608
1861	15,930,706	13,300,495
1862	15,630,995	14,915,680
1863	13,485,419	12,837,620
1864	9,147,274	8,992,479
1865	12,043,659	10,479,777
1866	12,777,557	11,634,740
1867	12,523,464	9,598,452
1868	12,750,578	9,878,090
1869	17,745,238	14,272,799
1870	19,060,991	16,027,771

The wheat trade of Milwaukie has thus very largely increased during the last ten or twelve years. If we take account of the receipts of flour as well as of wheat at Milwaukee last year and in 1869 the figures stand thus :

	1870.	1869.
Flour (reduced to bushels)	3,818,075 ...	4,038,815
Wheat (bushels)	19,060,991 ...	17,745,238
Total.....	22,879,066 ...	21,784,053

Similarly, the shipments of wheat and flour in 1869 and 1870 were :

	1870.	1869.
Flour (reduced to bushels)	6,126,700 ...	6,100,290
Wheat (bushels)	16,027,771 ...	14,272,799
Total.....	22,154,471 ...	20,373,089

The receipts of oats at Milwaukie last year were 638,281 bushels, of Indian corn 435,050 bushels, of rye 190,934 bushels, and of barley 585,764 bushels. Butter was also received at Milwaukie last year to the extent of 3,736,632 lbs., against 2,335,000 lbs. in 1869; wool to the extent of 1,959,912 lbs., against 2,501,666 lbs. in 1869; timber to the extent of 79,491,000 feet, against 72,382,000 feet in 1869; dressed hogs to the number of 94,884, against 85,351 in 1869; live hogs to the number of 67,377, against 58,296 in 1869; and cattle to the number of 13,118, against 12,221 in 1869.—The United States Congress has been occupied to some extent

with the question of the public lands of the Republic. Mr. Julian has prepared a bill which reserves hereafter all the remaining public lands to homestead and pre-emption settlement only. The chairman of the Committee on Public Lands is hopeful of passing this important measure. Two other bills are pending, reported from the same committee. One extends the provisions of the land laws to Alaska. It appears that speculators are working coal lands there, and stripping the most valuable timber along the coast. The other bill is one defining swamp lands. It is charged that large quantities of lands have been fraudulently included in the designation "swamp lands." By this bill, no land not permanently liable to overflow can be construed to be swamp lands.—Formerly there were large quantities of alzada or wild cattle in the Argentine Republic, but the Indians have left but few on the frontiers. In seasons of drought cattle sometimes stray hundreds of miles in search of water, but unless they calve on their new pastures, they invariably return to their "querencia" after the drought. It is stated that cattle-farming still yields fair results in the Argentine Republic—say twenty to thirty per cent. on the capital invested.—The fact is probably not known—certainly it is not appreciated—that Brazil has a greater area than the United States. She has probably also as much cultivable soil, but her population is only about one-fourth that of the American Union. Brazilian statesmen of all parties are agreed in declaring that immigration is the great and pressing want of Brazil; but, notwithstanding this unanimity, the question of simplifying and encouraging the transfer of land in Brazil, both in the interests of immigrants and the native population, has received no attention, except in regard to the small areas comprised within the limits of the Government colonies. One of the first requirements for the encouragement of spontaneous immigration into Brazil is the removal of the difficulty attending the transfer of land. It is argued by those who have given thought and attention to the subject that while "spontaneous immigrants" have to await the tiresome formalities and endless delays which attend purchases of land from the Brazilian Government, and the costly and tedious processes attending the making of sound titles to private lands, immigration will remain a dream. If so, more's the pity, as Brazil has undoubtedly vast resources. Another drawback to emigration from Europe to South America is the war and strife which seems to constantly curse, to a greater or less extent, that part of the world. Thus the Government of the Argentine Republic has a formidable rebellion now on hand in the province of Entre Rios, and little progress appears to have yet been made in securing a return of order and tranquillity. Just when the Argentine Republic seems to promise well as an emigration field, this rebellion is especially mortifying. Bolivia has also a revolution to deal with.

AGRICULTURE IN ITALY.

Amongst the startling events which have occurred in such rapid and unexampled succession during the past two months, there is none more important than what has taken place in the Italian Peninsula. There the policy of Count Cavour has seen its successful fulfilment, and the Italy of to-day stands forth before the world in all the majesty of united strength. Whilst others will pourtray the political and social aspects of this significant occurrence, we will endeavour to gauge, as accurately as the means at our disposal will permit, that which more especially concerns the agricultural resources and productions of the country. Here we are met in the outset by a difficulty which does not, happily, exist either in France or the United Kingdom: we mean the absence of any authentic official record of the distribution of the crops, such as is published annually by the Board of Trade. We are therefore compelled to take what are generally accepted as the best approximate accounts; and we have such in the "Annuario Statistico," by Dr. Maestri, published at Florence, the comparative statistical researches of Mons. M. A. Legoyt, the reports of her Majesty's Representatives upon the tenure of land, and what may be selected from the miscellaneous matter contained in the commercial reports of her Majesty's Consuls.

From all these sources it is quite possible to arrive at a sufficiently correct estimate for our purpose; for in most cases the information is gained by inquiries made of the leading landowners upon the spot, or is the result of communications with the members of the agricultural societies distributed throughout the provinces. It is well to observe that European agriculture presents two distinct aspects, one arising from the nature of the soil, and the other from the mode in which the soil is cultivated. Italy, Spain, Portugal, and Turkey, with a part of France, form the southern zone; whilst Belgium, Holland, Switzerland, England, the other portion of France, nearly all Germany, the Scandinavian Kingdom, and three-fourths of Russia are contained in the northern zone. This is the geographical division. The zone with the large occupations comprises England, Germany, Russia, Spain, Portugal, and Turkey; and the small subdivided properties are to be found in France, Belgium, Switzerland, Holland, and a portion of Italy: and this is the economic division.

We find that in 1865 the distribution of the soil in Italy, including Venetia and the Roman States, was stated as follows: Arable lands, including vineyards, covered 29,749,167 acres; natural and artificial grass, 3,472,772; rice plantations, 363,742; olive groves, 1,503,327; chesnut groves, 1,609,987; woods and forests, 12,088,822; pasturage, 16,794,847; making a total of 65,582,614 acres. From the same source we find it stated that lakes, marshes, &c., covered 3,005,885 acres, and waste lands from six-and-a-half to eight million acres. One-half of the soil that is cultivable is devoted to the growth of the cereals, whilst the meadow and artificial grasses form but four per cent. of the superficies. This last proportion is an indication of an apparent fact—that the agriculture is wanting in a sufficient number of cattle, and consequently in the requisite quantity of manure. Upon this head, we find the numbers given as follows: Horses, 1,462,816; cattle, 4,007,476; sheep, 9,736,101; swine, 4,059,021; goats, 2,615,427. The cereal productions are also much below the average of other countries. According to M. Maestri,

of wheat the annual average is 101,484,236 bushels; maize, 48,728,339; rice, 3,972,325. The other most important products are chesnuts, 15,771,000; potatoes, 27,894,157; vegetables, 11,899,178 bushels; oil 1,775,256 hectolitres, and wine 84,977,849 hectolitres. Resulting from these calculations the produce would seem to suffice for the populations, but the exterior commerce points to a different conclusion. In 1864 the collected imports of agricultural products are given at £28,540,208 sterling, and the exports at £19,345,940, showing a difference of £9,194,386. Silk, wine, fruits, vegetables, &c., however, serve, in a commercial sense, to restore the balance of trade against the kingdom of Italy.

These conclusions respecting the peninsula as a whole do not, however, apply to the plains of Lombardy, of Piedmont, and the northern portions which are irrigated by the means of former systems, and also by the recently-constructed Cavour canal. In Piedmont, upon the authority of Mr. Colnaghi, we learn the superficial extent contains about 18,000 English square miles, the proportion of mountain and hill to plain land being as 0.774 to 0.226, and the population in 1861 numbered 2,764,263 persons. In the hill region, and more particularly where the vine is nurtured, the land is chiefly in the possession of the small and medium proprietors, the lots averaging from $1\frac{1}{2}$ to $7\frac{1}{2}$ acres; in the fertile and irrigated plains, especially where rice is grown, large estates are the rule; the land is divided into properties varying between 100 and 3,500 acres, and even more. These are, in general, leased out to farmers, who form an important and wealthy element of the rural population. The landed proprietors are as 18 to every 100 inhabitants. The principal products of the soil are wheat, rice, Indian corn, oats, rye, and other grain, vines and mulberry trees, clover, lucerne, &c.; flax and hemp. Fruit, such as cherries, chesnuts, apples, pears, peaches, walnuts, and vegetables. On the rapid slopes of the hills, where the vine is cultivated, intersected with corn, spade husbandry is employed. On the easier sides and in the valleys the plough, drawn by oxen, is adopted. Steam power, in connection with agriculture, has not yet been introduced into the country.

The yield of wheat, notwithstanding the fertility of the soil is not up to the standard of modern agriculture. On an average the product is between 11 and 12 hectolitres per hectare, the English average being 35 hectolitres per hectare. One proprietor in Piedmont (the Marquis E. Di Samburg) has, by a good system, under unfavourable conditions, obtained an average yield of from 20 to 22 hectolitres. The rearing of live-stock on small properties is an object of no special care. In the mountain district of Ossola, cattle, which form the chief wealth of the mountaineers, are kept in a stable all the winter; during summer they are pastured on the hills and Alpine heights, as far as the Swiss territory. The animals are herded by the family of the owners, or are entrusted "à cheptel" to professional herdsmen. Although agricultural machines are found now-a-days in all the exhibitions that are held in North Italy, their employment, with the exception of thrashing-machines for corn and rice, is but little extended on large and not at all on small properties, their use having met with obstacles in the customs of the people. There are some, however, for sowing, &c., which are suitable to the country, and the introduction of machinery, which may in time become of great importance, is begin-

ning to increase. Of late years, too, considerable quantities of Peruvian guano and artificial manures have begun to be introduced.

The subdivision of the soil throughout the whole kingdom of Italy is not so great as obtains in France. The number of proprietors is given at 4,180,000 with an average of $12\frac{1}{2}$ acres each. Of the proportion of those who own land to the rest of the population in Piedmont and Sicily it is 1 to 4, Parma and Lombardy 1 to 6, in Tuscany 1 to 18, and for the whole in 1862 it was 17 to 100. The property is most subdivided in Piedmont and in the two Sicilies; whilst Tuscany, Romagna, and Umbria have large tracts belonging to the province, the commune and the religious orders, and these in general are badly farmed. We have in Mr. Colnaghi's report a very pleasing description of a visit to one of the landed magnificos of Piedmont. This was at a farm in the plain of Vercelli, called the "Venaria Vezullese" that formerly belonged to the House of Savoy, but was exchanged by the late King Charles Albert against the palace of the Marquis Durazzo, at Genoa. Rice fields form the principal wealth of this farm: its extent is about 2,500 acres, and the annual rent is about £5000. The farmer possesses 50 yoke of draught oxen, with cows in proportion. He has 12 pairs of mules, horses, ploughs, carts, and all necessary farm implements in profusion. Above 800 labourers are constantly employed, and at harvest time a number of occasional hands are needed. The farm buildings of dark brick, surround an immense quadrangle, near the centre of which stands the farm residence. At the time of M. Colnaghi's visit the Indian corn was being thrashed. On the floor whole families of peasants, women and children of all ages, were working gaily to gather in the fruit of their labours, the Indian corn being shared in unequal parts between the farmer and the labourers. The whole arrangements of the farm, if rough in outward appearance, were in good working order, and would seem to imply considerable agricultural progress.

The cultivation of the vine has received greater attention; the old system of festooning, which presents such a picturesque appearance, has given place to the better method of planting followed by the vine-growers of the Côté d'Or and the Gironde in France. At the wine fair held at Turin last year, 103 proprietors presented themselves in the market with 600 descriptions of wines, forming a total of more than 148,000 bottles. The object of the Societa di Gianduja being to promote a trade in, and not an exhibition of wines, the prizes and medals were only awarded to qualities of which 50 bottles at least were actually brought to the fair, and it is intended in future to raise the minimum to 200 bottles.

Throughout the extent of modern Lombardy a similar activity is observable. The agricultural productions are many and varied, and extend from the lemon and olive trees of the Lake of Garda to the pasture grounds of the Alps. Vines and mulberry trees, with wheat, Indian corn, and other grain, are grown on the hills and upper plains; while rice, flax, and hay form the chief products of the irrigated lands. The country is rich in silk, cheese, and butter. The products of the mountain districts are obtained by the hard labour of the owners of the soil. The use of the spade prevails, the plough being only employed on the level ground of the valleys. In the valleys rye, barley, potatoes, buckwheat, and maize are grown; but not in sufficient quantity to supply the wants of the inhabitants. The slopes of the hills are covered with chestnut trees, important not only for their timber but their fruit, which is consumed in large quantities by the people of the plain as well as the mountain. The rearing of cattle has lost some of the importance it possessed in an earlier period of Lombard history; still the breeding

of calves—a great gain to the peasant—is actively carried on, especially in the villages. On the small farms in the valleys cattle are always maintained, generally in sufficient numbers for draught purposes and for the supply of manure. The general opinion prevails that the small properties are suitable to the hill districts and non-irrigated plains and lands where the vine is cultivated; but not to the irrigated plains; and the general practice of the country would seem to conform to this view of the question.

In the Venetian provinces, when the harvests were good and there was a surplus of wheat and maize, the market price of provisions at Messina was for beef 8d. to 10d. per lb., bread $2\frac{1}{2}$ d. to $3\frac{1}{2}$ d., cheese 7d. to 8d.; eggs 7d. per dozen, flour $2\frac{1}{2}$ d. to 3d. per lb., fowls 1s. 8d. to 1s. 10d. each, potatoes 9s. per cwt. Barley, oats, and rye are not cultivated to any great extent in these provinces, but are always imported for local use from the Levant and the Black Sea. That the conditions under which the agriculture of Italy is conducted are of a chequered character we learn from Mr. Consul Walker at Cagliari, who gives a graphic description of what happened to the husbandmen in the island of Sardinia during the year 1868. It seems the whole of the crops, with few exceptions, were completely devastated by the immense inroad of locusts from the coast of Africa, which alighted on the wheat and barley crops that promised to yield an abundant harvest, and, with few exceptions, not only ate the ears of grain but also the straw; in fact, no green herbage was free from their attacks, and even the houses were visited by them in shoals, and every piece of drapery they alighted upon was immediately riddled through and through. The consequence of this frightful visitation was, the poorer classes had nothing to subsist upon but herbs and roots which they gathered in the mountains and forests. The people generally are described as very superstitious, and owing to their inactivity the soil, which is otherwise productive, is made to yield nothing under any circumstances. Their mode of life is most primitive, in habits resembling those of the nomad tribes: their villages are built of soil bricks baked in the sun: they subsist on bread, oil, and olives; and if a feud occurs in a village, and a murder is committed by any member of the community, the perpetrator is sure to meet his death, sooner or later, from the parents or relatives of the deceased: the vendetta practised there being very similar to that which originally existed in the island of Corsica.

The cultivation of the land in the Roman States presents a great variety of systems, varying according to the special conditions or the wants of local consumption, and dependent upon the nature of the soil and the productive capacity of the people. The produce consists of wheat, maize, rye, oats, buckwheat, hemp, vines, mulberries, chestnuts, olives, and fruits. In the "Agro Romano," which is the name given to the land extending around the capital and down to the Mediterranean, the small properties are restricted to the vineyards and orchards around Rome and the towns of its vicinity: the rest is divided into large tenements belonging to pious institutions, and these are inalienable. Most of the land is kept for the four years' rotation, one year corn and three years pasture. With some rare exceptions the proprietors never cultivate the land on their own account, but let it to tenants. They live in town on their rents, and are not even in the habit of visiting their estates, except for a shooting party or a pleasure expedition. The Campagna is not inhabited, but in the autumn numerous companies of peasants from the Abbruzzi and the Marche and other parts, led by their chiefs who are called corporals, descend to the plain for the purpose of sowing. When the work

is finished all these labourers go back to their country to return in June for the harvest. Thrashing and some other machines of English makes are being adopted, but their effects are not yet visible in the general condition of the land.

Before completing this sketch of the agriculture of Italy, we must not omit to mention that the cotton plant has

taken root, and the best results have been obtained in the provinces of Naples, Sardinia, and Sicily, where the average produce is 450 kilogrammes per hectare, and at ordinary prices this would yield a net profit of 180 fr. per hectare. Tobacco is also an important culture, and the growth and manufacture are submitted to the same restrictions as prevail in France.

THE EMPLOYMENT OF AGRICULTURAL LABOUR.

At the meeting of the Botley and South Hants Farmers' Club, Mr. W. Warner in the chair,

Mr. SPOONER read a letter he had received from London, giving an account of what was done at a meeting held there, under the chairmanship of the president of the Royal Agricultural Society, and at which it was decided to raise a fund in order to supply seed-corn to the peasant farmers in France to sow in the land in order to serve the next year's harvest, and thus to avert a famine. The fund was called "The French Peasant Farmers' Seed Fund," and contributions of seed-corn would be received as well as subscriptions. It was not very often that they recommended anything in the shape of subscriptions from the Club, as they were most anxious to concentrate as much as possible for the Club's benefit, but he thought that in this case they might very properly do what they could to assist the French peasant farmer, and thus avert a famine in that country.

The CHAIRMAN said they all knew that the French peasantry were suffering very much from the present cruel, and he might say wicked war, and he thought they ought to show some sympathy with them, however small it might be, and assist them in carrying out that which was for a proper and right purpose. He should be happy to give something towards it, and he hoped it would be taken up generally throughout the kingdom.

The CHAIRMAN then said: I feel that the employment of the agricultural labourer requires not only our consideration, but also the serious and earnest consideration of the whole nation. Most, if not all present, are aware of the great number of able-bodied men out of employment. It has been stated as a reason for this that the country is over populated, that there is not sufficient employment for the population, and that the only remedy for it is emigration. My object will be to show that the country is not over populated, that there may be sufficient employment found for all the labour of the country, and that emigration is the last measure to which we should resort, and only then when all other means are exhausted for the employment of our labouring poor. With regard to emigration, though I would not prevent persons from emigrating, if they had the means and inclination to do so, I would deprecate any assistance being given from the country as a means of getting rid of the so-called surplus population. I look upon the labouring population as the wealth of our country, and our labourers and artisans as the strength and sinew of the nation. Neither money nor land are of use without labour, and if it can be shown that both money and land can be made profitable by the employment of that labour, it should be our duty to keep it, if possible, in the country. There is another consideration which should influence us. Supposing we were invaded by a foreign power (and we are not unlikely to be), to whom should we look to protect us but our stout able-bodied labourers and artisans? When there was a talk of invasion in 1860 the labourers, artisans, and tradesmen, came forward in greater proportion than any other classes. I have by me the constitution of a Volunteer force in the county of Haddington, which is as follows: Merchants and tradesmen 94; surgeons 2; teachers 7; farmers 7; clerks to lawyers, bankers, and merchants, 26; gamekeepers 12; fishermen 8; mechanics and artisans 205; labourers 97; total 458. I merely name this to show the great proportion of the labouring classes (and this remark is applicable to all Volunteer corps), and the position we should be in if we sent them out of the country. Experience tells us it will not do to depend altogether on our men of leisure to defend us. Now, there are many means by which employment may be found for the

labourer. In the first place, I consider it the duty of Government to find employment where it can be done to the benefit of the nation and the welfare of the labourer. I will quote what an eminent writer on agriculture, Albert Thaer, who lived in the last century, says on the duty of a Government: "A Government which recognises and adopts this principle, viz., that the improvement and culture of the soil to the highest degree possible, contributes more than any other thing to the welfare of the country, and to the strength and riches of the State, and that all other considerations of political economy must yield in importance to the necessity of promoting the increase of produce. A Government which recognises and acts on this principle will, by so doing, add considerably to the value of land, and induce foreigners to invest their capital in it." And he goes on to say: "The more numerous the population of a country, the greater is the value of the profit to be derived from the cultivation of the land." I perfectly agree with all this, and I consider the Government, as stewards of the nation, are bound to make the most of the land it has in its own management; and in reference to this I would say that it is a reproach to any Government and a scandal to the nation to allow such a large tract of land as the New Forest to be lying unproductive, while so many people might be employed there to their own welfare and to the benefit of the country. I am happy to see the Government are taking some steps towards the enclosure and utilisation of the land in the New Forest, and I trust they will not be deterred by any opposition from parties who, merely from sentimental or other mistaken motives, wish to keep it in its present discreditable, unprofitable, and unproductive state. I do not pretend to say in what way the enclosure and cultivation of the land should be carried out. There are more competent persons than myself to give an opinion on this point. As to spoiling the beauty of the scenery, I believe that by a judicious system of setting apart the most productive portion of the land for cultivation and planting that of an inferior quality, with parks for recreation and pleasure parties, the beauty of the forest would be much improved, the land increased in value, employment would be found for a great amount of labour, and at the same time a large amount of revenue would be brought to the State. Other means, by which a great amount of labour could be profitably employed, would be the enclosure of commons and waste lands not enclosed; the breaking-up of waste and unprofitable land enclosed in private lands, and the drainage of enclosed lands in cultivation. 1st. With regard to the enclosure of commons and waste lands, not enclosed. It has been stated that since 1775 there have been seven millions of acres of land enclosed in this country, the greater part of which has been brought into cultivation. This has been the means of employing a great amount of capital and labour, and I may venture to say that in hardly any instance has it been allowed to revert back to its original unproductive state. I would quote instances, if necessary, of enclosure of land in this locality—Waltham Chase, Curdridge Common, Botley Common, and many others, where land which was before comparatively worthless and unproductive is now producing good crops, employing a great amount of labour, and paying a rent as high as, or higher, than some of the best enclosed land in the kingdom. Unfortunately, there are instances where large tracts of land have been allotted to parties who have allowed it to remain in its wild uncultivated state, reaping no benefit themselves, and inflicting a serious injury upon the interests of their poorer neighbours from want of employment, and causing a great loss of good to the country. The enclosure of land in such cases I consider an

injury rather than a benefit, and I think it would be a good law that in all future enclosures a stipulation should be made by the commissioners that within a given time all land to be enclosed should be cultivated for corn or other crops, or be planted. This would be the means of making the enclosure both profitable to the owner, as well as to the company at large.

2nd. There is another means by which a great amount of labour may be profitably employed. There is a great quantity of waste and wood land in the hands of private proprietors which is now paying comparatively nothing to the owners. Now, if every owner of an estate were to look around his property, he would see that by judiciously breaking-up some of his wood land and waste, he would receive a greater amount of interest for the capital so employed than on the best portion of his estate. Instead of receiving about 3 or 3½ per cent. for his money invested (which is, I believe, about the usual interest land pays), he would receive at least 5, and in many instances 7 and 8 per cent. for money so expended; he would be also doing a great good by employing a great quantity of labour, and by making his land more productive would be adding to the resources of the country. I have taken the trouble to ascertain the number of men out of employ in the neighbouring unions of South Stoneham and Droxford. In South Stoneham union there are 448 men out of employ, and in Droxford union there are 160 men out of employ. Now, I would venture to say I could point out estates in those different unions where all, and more than all, these men could be profitably employed.

3rd. Another means of profitably employing labour is by draining the wet lands of the kingdom now in cultivation, but not yielding a fair amount of produce. Mr. Bailey Denton, in one of his lectures on draining, informs us that twenty million acres of land remain undrained in Great Britain, and of these about nine millions of acres are clay soil. Now, I believe that those gentlemen present who have had experience of the good effects of draining will say that there is no labour so profitably employed in the land as draining; it is the first and greatest improvement, and without it it is comparatively useless to farm wet land. Tenants willing to pay 5, 6, and 7 per cent. for draining, it is a good investment for the landlord; it is good at the time of year when men most need work; and it not only increases the production of the soil, but also enhances the value of the land, converting what was before a stubborn clay into a rich friable soil, and producing as fine crops of corn and roots as any in the kingdom. Unfortunately, gentlemen, there is a law in our country which prevents the improvement and cultivation of the soil being carried out to the greatest advantage, which is the law of entail. Many proprietors of estates have only a life-interest in their property, and thereby have no inducement to improve it, and however much may be required to be done, it is left undone, and continued on from one owner to another, to the great injury to society, and a great loss to the country. Now, in a country like that, where the population increases 25 per cent. in every twenty years it is quite time this pernicious law should be altered, since it operates so prejudicially to the employment of labour, and against the best interests of the nation.

5th. A great deal more labour and capital would be employed on the land if gentlemen would desist from that excessive preservation of game which is carried on in many parts of the country, which is much to be deplored, and which cannot be sufficiently deprecated. It prevents expenditure of capital on the land, as no man in his senses would spend his money on a game farm, well knowing all his exertions would be useless, and ending, perhaps, at last in his ruin. Many tenants have spoken to me on this subject—one not long since, who is a tenant of a large landowner, told me he had expended a considerable sum in the purchase of manures for his farm, but that he found the hares and rabbits had so destroyed his corn that he should not lay out any more money in manure, but would get back what he could, and give up his farm the first opportunity. This is not an isolated case, but the case of hundreds and thousands of tenants. The preservation of game has been the ruin of thousands; it has prevented capital from being expended on the land; it has been and is the means of many men being out of employment; it encourages poaching—an offence which leads on to other crimes, and it also burdens our poor rates, and fills our prisons. Both public and private opinion has been expressed on the subject, but I am sorry to say (with only a few exceptions) to very little purpose. It is said by

some who approve of game-preserving that we would interfere with the rights of property, and that every man has a right to do what he will with his own, and if he chooses to keep a large quantity of game, however injuriously it may affect others, he has a perfect right to do so. Others have said if you deprive gentlemen of this sport they will leave the country, and spend their incomes abroad. I am afraid those who argue thus do not consider that while property has its rights and privileges, it also has its duties; and I consider that those who by their excessive preservation of game are the means of inflicting injury on their neighbours, and on society at large, are not right, but morally wrong, in so doing. Neither can I conceive that sport should be considered the primary object of a man's life, and to be indulged in irrespective of other considerations. Now it is not the wish of the tenants and those who argue against excessive preservation, or of the public generally, that gentlemen should be deprived of their sport. All that is asked for is that it be rational sport, not that foolish battue shooting where thousands are killed in one day, and where the poor birds are seen running around the legs of the keepers, little knowing the fate that awaits them; but such sport, that while it affords sufficient amusement and enjoyment to the sportsman, should not be carried to that excess which operates so injuriously to the community at large. I have made the game question a part of my subject as I consider it has a great deal to do with the employment and welfare of the labourer. I also consider it a growing evil, and if not checked will become a curse to the country. The population of our country is about thirty millions. Now, according to Mr. Caird's statistics, in which he is borne out by Professor Leone Levi and other eminent agricultural writers, we only produce food for twenty-one millions, leaving us deficient of food supply for nine millions of our people, for which we are dependent on foreign countries. Now, if we were at war with America, or with any of the continental countries—Russia, for instance—which may happen any day, in what state should we be? We should have corn at a famine price, and with a great number of people out of employ, it would lead to a great distress, and perhaps disturbance in the country. How necessary it is, then, that we should try to make ourselves independent of foreign supply. I have endeavoured to show how more food can be grown for the people, by the employment of more labour and capital in the land. Captain Maxse, in his excellent lecture in our last session, told us of the enormous quantity of land not cultivated in this country, amounting to near twenty millions of acres, a great portion of which is capable of cultivation. Mr. Bailey Denton has told us of the large quantity of land capable of improvement by draining, and other improvements. Now, if landowners and occupiers of land would look on this subject not only as affecting themselves, but as affecting the best interests of the country at large, they would find that we not only could grow food sufficient for our own population, but we should be keeping some eighteen or twenty millions of money in the country, which, by circulating amongst the producer and consumer, would in the end repay any outlay incurred by the landowner and occupier. We should find that the manufacturers would be consuming our corn, we in turn consuming their manufactures, thereby making the country self-supporting, and not dependent on others. We should also—from having our labourers and mechanics employed—have less poor-rates and less county-rates, and from having less idle men we should have less criminals, as we all know that idleness and poverty are the parents of crime. That we could do so I will quote Mr. Mechi. He says, "What a happy country this would be if, by freedom of agricultural action, and by investment of ample additional capital and intelligence, we could produce our own food as we manufacture our own clothing and other necessities, and in the act of so doing employ more of the British people, thus diminishing suffering and pauperism, and increasing the wealth, strength, and content of our country. Experience has taught me that all this could be profitably done, and I pray that those who have the power may be moved to encourage by suitable and improved legislation, and by every other means, so desirable a result"; and he goes further on to say, "let us, then, resolve to amend our agricultural ways for our own profit, and for the good of the country." I quite agree with Mr. Mechi; but to obtain so desirable an object, to whom must we look? In the first place we must look to the landowners of the country; without

their consideration and assistance we can do nothing towards increasing the productiveness of the land, or the employment of the labourer; and I would appeal with all respect and sincerity to owners of property to reflect on the great responsibility attached to the possession of land. It has no doubt great rights, great privileges, great advantages, and gives great enjoyment to the possessor, but it has, at the same time, great duties to perform. On owners of land it depends whether this country shall be a rich and prosperous country; whether employment shall be found for all living in it; whether we shall produce sufficient food for the nation, so as to be self-supporting, relying on ourselves, and independent of foreign countries; or whether we shall remain as we are, with thousands out of employment, producing food for only two-thirds of our population, and dependent on foreign countries for food for one-third of the people. I feel assured, if all landlords could realize and would endeavour to carry out this idea, they would be the means of doing a great good; they would command the respect and esteem of all around them; in benefiting others they would benefit themselves, and in reality be great benefactors to their country. They would also in this be assisted by their tenants, who, having the co-operation of their landlords, would willingly invest more capital on their farms, which is much wanted, and they would be also assisted by all around them. There would be no distrust between landlord and tenant, and we should then in reality, both landlord, tenant, and labourer (to use the common saying) be found rowing in the same boat, actuated not alone by our own individual interest, but by the interest of the whole community. Some landowners may not be in a position to make so great an outlay as is here required, but as this would be a national benefit, I think the Government would be only doing right in assisting those landowners to carry out so desirable an object, by advancing money at a moderate rate of interest, to be repaid in a certain time. Perhaps some may say this scheme is too good to be carried out. Of course all cannot be done at once, but where there is a will to do good there is always a way found to do it, for

He that thinketh good, good may do,
And God will help him thereunto;
For never was good work wrought,
Without beginning of good thought.

In giving you my ideas I trust I have said nothing that may appear offensive to the feelings of any party. If so, I must ask to be pardoned, as it was not my intention to do so. My object has been to keep as close to the subject as possible, and to make such observations as can be practically carried out, I have endeavoured to show how labour can be employed to the advantage of the landowner, tenant, and labourer, and to the country at large. If I have failed to do this, I must ask you, gentlemen present, to correct my errors. In conclusion I would say, as employers we are apt sometimes, during the short days of winter, to reduce our labour, thereby throwing many men out of employ, who are obliged to come to the parish for relief. Now I think if we were to look at it in a business light (irrespective of higher considerations) we should find that it would be more to our interest to keep them employed if possible, earning something, than to be living in idleness, earning nothing. They must not be allowed to starve, and if the employer does not bear the whole of the burden of supporting them while out of work, he does the greater portion of it. Neither should we forget that the only property the poor possess is their labour, and, knowing how dependent they are on us for support, we should be only doing our duty in showing our consideration towards them, by finding them employment that they may be enabled to support their wives and families. As my subject is essentially affecting the welfare of the poor, I will finish in the words of One who was in every way the poor man's friend—"Blessed is he who considereth the poor."

The Rev. J. M. LEE wished to know how Mr. Warner had obtained the information as to the number of men out of employ.

The CHAIRMAN replied that he had got them from the surveyor of roads in that district, who had obtained them from the different people of whom he had made inquiries. In the South Stoneham Union there were 446 out of employ, viz., in Botley parish, 34; Bursledon, 12; Westend, 23; Millbrook, 200; South Stoneham and North Stoneham, 100; Bitterne, 25; Hamble, 7; St. Mary Extra, 20; Hound, 25. In Droxford

Union there were 160 men out of employ, distributed as follows: Bishop's Waltham, 16; Droxford, 43; Durley, 7; Corhampton, *nil.*; Exton, 8; Hambledon, 16; Meonstoke, 6; Upham, 16; Warnford, *nil.*; Westmeon, *nil.*; Soberton, 16; in the Union-house, 32.

Mr. JAMES WITHERS said there were ten men out of employ at Durley.

The Rev. J. M. LEE: Do you wish it to go forth that there is this number of men out of employ at this particular season?

The CHAIRMAN: Yes, at this particular season.

The Rev. J. M. LEE said this cold weather kept many men out of the woods who would be at work there if it was not so severe. These could not be said to be unemployed.

The CHAIRMAN remarked that he had merely obtained the number of men not at work at the present time, and his object was to make more work for people who wished to take the advantage of it.

The Rev. J. M. LEE said his reason for asking these questions was in order to find out if he possibly could how many of the 446 were really out of employ. He took it that the breaking up of the New Forest would not employ all those people, as many of them were skilled mechanics and artisans.

The CHAIRMAN: There would be a great many more employed than there are now.

Mr. SPOONER: And it shows the necessity there is that something should be done.

The Rev. J. M. LEE said he might mention that a farm carpenter was thrown out of work in consequence of the severe weather, and he was instructed to offer him the loan of a sovereign, but the man thanked him, and said he did not desire it. He said that he should be glad to go to work again, and would do any then, but there was no doubt such men saved up a little in the summer in order to provide for such times in the winter, and therefore they could not be reckoned among the permanent unemployed.

Mr. C. MILWARD, Q.C., said he was sure they must all feel thankful to Mr. Warner for the way in which he had introduced the subject, and he had no doubt his suggestions would result in great advantage, but there was one thing which he did not think he could agree with him upon, and that was when he spoke of the Government being called upon to do the work of reclaiming the waste lands.

The CHAIRMAN replied that he did not ask the Government to do the work, but merely to advance the capital needed.

Mr. MILWARD said he thought Mr. Warner was speaking to the effect that the Government should reclaim the waste land in the New Forest themselves, and all he could say was, "Heaven help us if they had to do it" (laughter). He said this because he believed a lot of money would be badly spent, and when the work was begun they would not know when it would end.

The CHAIRMAN explained that he meant the Government should utilise the land.

Mr. MILWARD said that would be all very well, and he maintained that the Government had no right to be landowners, but the people of England should be able to derive a benefit from their waste lands. He was not what might be termed a destructive by any means. He would rather see the beautiful trees, the places of amusement, and the lively spots protected as they were at this moment, and he thought this might be done, but at the same time he considered that they should be made profitable and a benefit to those who had charge of them and the nation at large. A great many owners of large estates were surrounded with the difficulty of the law of entail. He was not fond of that law, but he did not see that England they could do without it. Mr. Milward then alluded to the law in existence in France, where each person in most cases took a share in the lands, and thus it was split up into small estates, and said he did not think such a law would do here, as it was necessary that they should have landlords who were men of position, and who could hold their proper positions in England. He should be rather afraid that this would not be the case if they did away with the law of entail. He agreed with Mr. Warner that this might be remedied to a great extent if a landlord would be able to raise a loan for the improvement of his estate from the Government. This had already been carried out to some extent, but not so large as it should be, and in many instances the system had worked exceedingly well. The money could be advanced

upon a certain term of interest, which would be charged upon the estate, for permanent improvement, and then the owners of property would feel inclined to improve it, but now in many cases they did not do so when they knew that the money they were spending was being taken out of their pockets for the benefit of those who came after them. This sort of thing was carried out with great advantage in Ireland in 1848. An arrangement was then made, it was a simple one, and worked extremely well. The Government then advanced any amount of money that was needed for erecting farm buildings and all kinds of farm purposes which were of a permanent character. They had a charge of $6\frac{1}{2}$ per cent. on it, and so much of the capital was to be paid back every year, so that the Government really lent their money at about $3\frac{1}{2}$ per cent. The money had to be paid off in $22\frac{1}{2}$ years, and he could tell them of his own knowledge that in one district men, women, and children who had before been almost starving were set on to work, and thus the poor-rate was saved. That money supplied in this way saved an estate from almost insolvency; it gave work to the people, and in every sense did a great deal of good. He did not see why that principle should not be adopted in this country. Great improvements on a farm could not be made by the tenant, but must be done by the landlord, and he should like to hear the opinions of some of the members of the Club on it. The reclamation of waste lands entailed much expense, but they could see what had been done in that way in that part of the county. He agreed *sub modo* with Mr. Warner with regard to game. He did not think in that part of the county they suffered from an over-preservation of game.

A MEMBER: You need not go very wide to see it.

The CHAIRMAN thought Mr. Milward would not have to go very far, as he might speak for himself.

Mr. MILWARD did not think he could say much for himself, for he could not get any pheasants when he wanted them. But at any rate they would be living on his own farm. He honestly confessed that he did not know of any estate in that district which was overrun with game.

The CHAIRMAN: I do; a great many, and not one hundred miles of Botley.

Mr. MILWARD continued: Then all he could say was that he should like to be in at the death of the game. At any rate he was not overburdened. Many farmers complained of the game on their farms, and that was the result of a bad bargain. If tenants were not so eager to cut one another out and take the land as it was they could make better bargains with the landlord, but as soon as a farm was void now there were so many after it that they did not get a condition attached that the game should be cut down. The landlord got the rent and the game too, and he was quite right in taking advantage of the farmer if he was fool enough to take land, which was not capable of paying him with the game on it. There was a third party to consider with regard to this question, and it was the labourer, who often got employment in a day's *battue* shooting. Sometimes he got something else, and it was that he got shot into the bargain. Game on a farm might be a temptation to poaching, but he did not think that it very much interfered with the labouring man. He had touched upon what the landlords could do in the reclamation of land, and he had a word to say with regard to the farmers. By employing labour they saved the poor-rates, and it was to their interest to keep them as low as they possibly could. The question was, did they (the farmers) employ as much manual labour on the farms as would pay them? He often went over farms where he saw there was a great scarcity of labourers. Many things were left undone for the want of a little elbow grease. He did not mean to say that it would pay in all cases. He thought there were a good many farmers among them who did not employ as much labour as would pay them. Much might be done in the shape of weeding, hedging, ditch cleaning, and clearing up work on the farms, and he would ask the employers of labour present whether they could not do something themselves towards keeping down the poor-rates, which after all came out of their pockets.

Mr. JAMES WITHERS said every one must acknowledge that the subject was a well chosen one, and that it had been very ably introduced by Mr. Warner. A more suitable or appropriate subject for the present times could not have been selected, and he was persuaded that a more competent and better qualified person than Mr. Warner could not have been chosen

to introduce such a subject, because he had, and still continued to put in practice all which he himself advocated. There was a saying to the effect that property had its duties to perform, as well as its rights and privileges to claim, and he would venture to say that if every owner of land in the kingdom had done so much as Mr. Warner had, and still was doing, by reclaiming waste land and by improving that which was already cultivated, there would have been no necessity for bringing such a subject before the Club, because there would be no distress, or likely to be any arising from the want of employment. There would be no necessity for sending working men over the seas to cultivate foreign wastes for food which we consume, because there would be no spare labourers to send, and most probably a cry would be raised for more labourers in the market to keep down the price of wages, while some millions of pounds annually would be circulated at home, in lieu of the purchase of foreign food for millions of our own population. They often heard of great benefactors, gentlemen who contributed most liberally towards the relief of the distressed poor, but far better was it to put the working man in a position to help himself by productive labour than by doling out gifts of charity when in distress; and he who could devise the best means to produce the most of permanent and productive employment to the working classes was in deed and in truth one of the greatest benefactors to his country. The building of ships, &c., simply for the purpose of employment was not productive labour. The erection of buildings which were not required was not productive employment, but a tax upon the industrious, and was, in fact, labour lost, like lost time, which was never found again. The wealth of every nation had its groundwork in the cultivation of the soil, and it was in proportion as waste land became cultivated, and cultivated land was rendered more productive, that capital arose for the purpose of trade, commerce, and manufacture. If it was required of him to devise some plan which should ultimately tend to England's greatest wealth and future prosperity, he would unhesitatingly say, "Break up the waste land of England." There were, he knew, a few individuals who would throw cold water on this subject. One said that the waste land was too poor to cultivate, and if cultivated would soon return to waste again. Another would make it appear that the New Forest and other similar wastes was a benefit as it now was, while others thought they could not afford to sacrifice the beautiful scenery. He had, however, during twenty-five or thirty years past, seen some thousand acres of what was termed poor waste land brought into cultivation, but he did not know of any such return to waste again because it was too poor to cultivate, and some of this had, to his knowledge, produced twelve sacks of wheat to the acre, and twenty-four sacks of oats; but no one seemed to know that such was good land until labour had been applied to it, it always having the name and appearance of poor waste land. As regarded the native beauties of the Forest and other wastes, he would simply remark that such would afford no beauty to the poor hungry unemployed labouring man. He knew that the proposed plans would be detrimental to the interest of a few individuals, and perhaps it would be impossible to confer a national benefit of any kind without it, but should they consult the interest of the few and starve the many? Could they sacrifice the welfare of thousands, nay millions of our fellow countrymen, for the pleasure and the profit of a few individuals? It must be wrong that so many millions of money should be annually sent over the seas to enrich foreign lands, while they had so many working men who needed employment, such a large consuming population, and such a very large proportion of waste land in England, wastes which needed the very bone and sinew of our working men to enrich our own country by more extended cultivation. At all events, present circumstances call loudly both to landlord and tenant, and to legislative gentlemen also, for the employment of our increasing working men. Much might be done by the joint efforts and co-operation of landlord and tenant to alleviate the suffering of men unemployed by the increase of productive labour, which would prove beneficial to themselves and to the country at large. There were many thousands of acres of land which needed draining in that neighbourhood, and would be a benefit to all concerned.

Captain MAXSE thought all would agree that there was much waste land which was fertile and ought to be under cultivation, and he took it that this would not only benefit the country but would take up much of their unemployed labour. He had gone

into figures which could not be impeached, and he maintained, that he was right in saying that there were eleven millions of acres of land in this country which was not cultivated. He did not then pretend to say how it should be brought into cultivation, and he did not think the landlord, the farmer, or the labourer were to blame in this matter. It was the land system, which prevented capital and labourer from going into the land. The law of entail, of primogeniture, in case of intestacy, and he must say the comical system of conveyancing were great evils. By it land was kept in a few hands, however worthy they might be, and thus was shut up. Something had been said with regard to game being a bargain between the landlord and tenant. The initiative rested with the landlord, who had the best of it in driving it. There were always a great number of claimants for a farm and the land, and thus they saw the landlord had the opportunity of making his own terms accordingly. He might select a man who would put up with a great deal of game. He should like to see the resolutions they passed not mere barren ones, but that they should use their influence to get the land system altered, and this could be done at a Parliamentary election. When an election came they should protest against it, and should aim a blow at the cumulative land system. If a man came forward to represent them in Parliament, he would ask him if he was in favour of the abolition in cases of intestacy of the law of primogeniture, of modifying the law of entail, and of getting a cheaper mode of conveyancing property. If this could be done it would tend to bring more land under cultivation and tend to lessen the poor-rates, and he was in favour of land being conveyed at the expense of the state.

Mr. MILWARD said while he agreed that conveyancing was very costly there was something to be said on both sides. He might mention that a court was established three or four years ago to render the conveyance of land more easy, but almost nothing had been done there, but if gentlemen did not choose to take advantage of it, it was their own fault, and not that of the Government.

Mr. RICHARDS said the game question was a very sore one to him, and therefore he could speak with some feeling on the matter. Mr. Milward had said that he did not think that game had much to do with the labour on the farm, but he could tell him where there were only half crops on the land only half the labour was employed there, and that was the case in many districts in Hampshire. It also tended to demoralise the poor, fill their prisons with poachers, and others who committed depredations arising from it.

Mr. SPOONER said among the many subjects that had been discussed that evening, there was that of game, but he thought they had hunted on all sides instead of going in that which really was before them. They had not only considered the agricultural labourer, but they had also spoken of waste lands, of the preservation of game, and, among other things, they had gone into the law of primogeniture. He could not help thinking that in the discussion the true scent laid down had not been followed, and surely their object was to see if they could not succeed in getting some suggestions whereby the labouring man might be more extensively employed during the winter. He said during the winter time, because in the summer months there was no difficulty about the matter. All men could then be fully employed in the South of England. There would always be a large amount of infirm and aged people, who had done their work on the farms. They had been paid for their labour, and the farmer so far had benefited by them, and it was necessary that in their old age these should be supported. In providing for these, people must submit to local taxation. He would quote a quaint old Act bearing on the subject, and to which Sir George Jenkinson had alluded lately though not on the same question as they were now discussing. It was passed in the time of Elizabeth, and was as follows: "Be it enacted by the authority of this present Parliament that the churchwardens of every parish, and four, three, or two substantial householders there, as shall be thought meet, having respect to the proportion and the greatness of the same parish and parishes, to be nominated yearly in Easter week, or within one month after Easter, under the hand and seal of two or more justices of the peace in the same county, whereof one to be of the quorum, dwelling in or near the same parish, or division where the same parish doth lie, shall be called overseers of the poor of the same parish; and they, or the greater part of them, shall take order from time to time, by and

with the consent of two or more such justices of peace as is aforesaid, for setting to work the children of all such whose parents shall not, by the said churchwardens and overseers, or the greater part of them, be thought able to keep and maintain their children, and also for setting to work all such persons, married or unmarried, having no means to maintain them, and use no ordinary and daily trade of life to get their living by; and also to raise weekly or otherwise (by taxation of every inhabitant, parson, vicar, and other, and of every occupier of lands, houses, tithes, impropriate, propriations of tithes, coal-mines, or saleable underwoods, in the said parish, in such competent sum and sums of money as they shall think fit) a convenient stock of flax, hemp, wool, thread, iron, and other ware and stuff, to set the poor on work; and also competent sums of money for and towards the necessary relief of the lame, impotent, old, blind, and such other among them being poor and not able to work; and also for the putting out of such children to be apprentices, to be gathered out of the same parish, according to the ability of the same parish, and to do and execute all other things, as well for the disposing of the said stock, as otherwise concerning the premises, as to them shall seem convenient." He called their attention to this in order to show that at that time they were compelled to find work for the unemployed during the winter months, and because that laid to the bottom—the very root—of their present difficulty. There might be labour to do in times of fine weather, but during the short days, and when the weather was very inclement, there was very little profitable labour to be done on farms. There were many farmers who could employ a larger amount of labour which would be profitable, and there were many who would employ much less in the winter than the summer if they looked to profit alone. They would not think it their duty to keep a man on in summer and winter. He thought that pointed out their difficulty. When the Act he had quoted was passed the people could be employed in weaving and such like, but that had been done away with by the general introduction of steam power. What they wanted was to find out whether they could not devise some means by which the unemployed might be employed during the four or five months of the winter. He considered that boards of guardians should look forward to find employment, and the parish roads might be repaired by those who were out of work. A surveyor was appointed now to overlook it, and the chief thing was to get it done as quickly as possible. It was done by contract, and when the days were long. He thought if the matter was placed in the hands of a few business men they would devise the means to employ their surplus labour, and if the roads were repaired during the four or five winter months it would be much better. He would ask them if there were not some roads which might be improved and made much better than they were at present? Were there not many teams which had sharp hills to climb, and whose owners would be glad to have them lowered? Surely it would be better to employ men in lowering such hills instead of having them inmates of the workhouse. He thought the guardians should consider well what could be done in difficult times, and that time was now come upon them. He considered that emigration was a very poor relief for it. They ought to keep good men there when they got them, but of course if a man had the wish to go by all means let him do so. It was not right to get rid of useful men, but at the same time they had a right to go to their friends. Emigration should be encouraged to a moderate extent to those who wished to go, but they should not get rid of those who might be the means of saving this country from an enemy if it was attacked. With regard to the land the landlords should join with the tenants in using every means to employ labour, and the land should be put into the hands of able men, who knew what was required, and give him the man who had plenty of money and a good intention. Some said that the Duke of Buccleuch, the Duke of Sutherland, Lord Leicester and others had too much land, but give him the men who had the means of employing labour and making the land supply that which it could not under other systems. In France they did not employ anything like the labour they did here. There was not the amount of capital used, and notwithstanding they had a more fertile country and a better climate they did not raise the amount of produce. He had no doubt that some beneficial alteration could be made with regard to the land laws and very likely with reference to the laws of primogeniture, but such a sub-

ject should be discussed by itself, and not dragged in as a fanciful solution of the subject before them. What they should do was to think how best they could keep the men employed during the winter months, in order that they might have their assistance at a time when it was of the greatest importance. They must also consider how the labour employed and the capital expended could be remunerative. He had no doubt great reforms would be introduced, that the waste lands should be broken up and cultivated, and that the land laws should also be broken into and improved too.

The Rev. J. M. LEE said one or two questions suggested themselves from what he had heard. In the first place there were generally a large number of people out of employ in the winter, and he could tell them that there were some in his parish who always expected to be out of employ at this time of the year. These were mechanics and artizans, who earned such wages in the summer that they could afford to loose a week or two in the winter. Then there were some who were out of employ in consequence of the hard weather, and who would not come before the board of guardians. If they did what Mr. Spooner suggested, he thought the farmers would be very loth to employ them summer and winter. They generally found it was not the thrifty but the idle and bad characters who applied to them, not able-bodied men. If they broke up the New Forest he thought that it would not effect what they desired, not that he desired to keep the forest on account its beauty, for he should not think of that if it would find work for men out of employ. The question of employing men in the summer as well as the winter months was a difficult one, but he would ask the farmers to employ them all the year round if they possibly could. Mr. William Warner kept his men employed during the winter months, and he had often taken on a man when he (Mr. Lee) had asked him in order that there should be no distress. He took very great interest in the agricultural poor of that immediate neighbourhood. Mr. Thomas Warner was a guardian of the South Stoneham Union, and he could tell them there were very few able-bodied men in the house, and nearly all those there had lost their situations, or there was a disinclination on the part of employers to give them work.

The CHAIRMAN, in reply, said the following extract would show that there was some necessity for doing something with the New Forest: "Now, assuming that it may be desirable to preserve the choice sites of the forest for the sake of the scenery, let 20,000 acres out of the 60,000 be set apart and offered in convenient lots for residential purposes. Calculate the same at the very low figure for such property of £50 per acre, and we have a snug little *million* in our pockets at once. Appropriate the remaining 40,000 acres to cultivation, and allotted as proposed in the above article, on long leases, at a rental of say 15s. per acre for the *first* term—afterwards to be increased, probably, to 25s.—subject, however, to tenant indemnity and compensation upon the principle of the Irish Land Bill, and we have an income of £30,000 a year, representing a *principal* of nearly another million, together an absolute value to the country of two millions, in the place of a *loss* with which we are now debited of £223 per annum. It will be seen the benefit by no means stops here. We have a further investment of capital of £600,000, at the rate of £15 per acre for clearing and stocking. As mentioned last week, an annual outlay, or value in personal labour of one pound per acre, being equal to the constant employment of *one thousand men* at 15s. per week (nearly

and giving an annual return in produce at £8 per acre, of £240,000—if occupied in small allotments, very much more." He thought he had shown that more labour could be given by breaking up the New Forest and other waste lands, and with regard to the game, he might have told Mr. Milward that there was a place not 100 miles from Bishop's Waltham which could not be let in consequence of the game, and a portion only was let the other day. With regard to what Mr. Milward had said—that the game was a bargain between landlord and tenant—the tenant had no choice. With reference to what Mr. Spooner had said, he might remind him he said nothing about the employment of women, and he (Mr. Warner) thought they would be much better employed in looking after their husbands and families, and also that large landowners threw a deal of land out of cultivation.

Mr. SPOONER said they had been talking about the landlords, but he thought they would bear favourable comparison with those of old as was shown by a form of prayer for them, used in the time of Edward VI. It was as follows: "The earth is thine, O Lord, and all that is contained therein; notwithstanding that thou hast given the possession thereof unto the children of men, to pass over the time of their short pilgrimage in this vale of misery. We heartily pray thee to send thy Holy Spirit into the hearts of them that possess the grounds, pastures, and dwelling-places of the earth, that they, remembering themselves to be thy tenants, may not rack and stretch out the rents of their houses and lands, nor yet take unreasonable fines and incomes after the manner of covetous worldlings, but so let them out to other, that the inhabitants thereof may both be able to pay the rents, and also honestly to live, to nourish their families, and to relieve the poor. Give them grace also to consider that they are but strangers and pilgrims in this world, having here no dwelling-place, but seeking one to come, that they, remembering the short continuance of their life, may be content with that that is sufficient, and not join house to house, nor couple land to land, to the impoverishment of other, but so behave themselves in letting out their tenements, lands, and pastures, that after this life they may be received into everlasting dwelling-places, through Jesus Christ our Lord. Amen." Mr. Spooner explained that what he meant with regard to rich landowners was that he preferred them to small ones, because they had the means of making improvements in agriculture and of employing a deal of labour, whereas others had not to such a large extent, however well disposed.

The CHAIRMAN then proposed the following resolution, which was carried unanimously: "That it is the opinion of this Club that the employment of agricultural labour may be profitably increased by the enclosure and breaking up of waste lands, by breaking up and cultivating waste and wood lands enclosed, by drainage of the waste lands, and by tenants having the right to destroy ground game without the control of their landlords."

The following was adopted as a rider to the foregoing resolution, on the motion of Mr. SPOONER, seconded by Mr. THOMAS WARNER: "That an additional and desirable means of employing surplus labour during the winter months may be afforded by the setting aside of some public work, such as the levelling of hills and the improvement of roads, the funds for the same being raised by public subscription."

A vote of thanks was passed to Mr. Warner.

THE DORCHESTER FARMERS' CLUB.

At the January meeting the subject for consideration was "The Present Tendency of Legislation in regard to the Repairs of the Highways in England," standing in the name of Mr. G. J. Andrews, the Secretary of the Club.

Mr. J. G. HOMER, the President, before calling upon Mr. Andrews to give his lecture, directed attention to a circular on behalf of the "French Peasant Farmers' Seed Fund," expressing his opinion that the appeal would be responded to individually, rather than collectively, by such bodies as Farmers' Clubs. Any member, he observed, charitable enough

to contribute to the fund, could send the amount direct to the secretaries in London, whose names and addresses appeared on the circular.

Mr. G. J. ANDREWS said: In order to understand the matter in its various bearings it will, I think, be desirable—first, to trace the origin of highways in England; secondly, to ascertain the laws or customs which provided for their making or expenses of repairing; and, thirdly, the property and persons which were liable to those expenses. Each day's experience shows that where a number of people locate themselves in a

particular spot there must of necessity be a principal road or highway to it. Before the Romans landed in this country (which they did at Deal, August 27th, A.C. 55) we do not find any mention of roads or highways in England. But Pearson, in giving an account of the Roman occupation, states that the roads were the first appliance in the mechanism of the Roman Government. In Britain, a distant and for some time a poor province, they were not constructed with the same massive solidity as the Via Appia, or the well-known road into ancient Rome, and it was only near large towns that they rested on stones or a thick bed of concrete. Generally the materials which came first to hand were taken, but in parts where gravel and stones were scarce the roads were made somewhat broader and higher at the top to secure them against the effects of weather. Intended primarily for war, they went as far as the country allowed with unswerving directness of purpose from one point to another, and rather commanded than followed the track of commerce. Made and kept in order by forced labour, they climbed hills which it would have been simpler to skirt, and travelled over morasses on piles. They were rather causeways than roads as we make them, except for railways, and their transverse lines of communication were often drained by fosses or ditches on each side. Their breadth varied from eight to 24 feet in the north, and sometimes rose to 60 feet in the great highways in the south—so says Hume on the Roman Road from Allchester to Dorchester (page 5). In the second century the Roman legions were quartered at York, Chester, and Carleon. The chief danger at that time was from the restless Caledonians and the untameable Silures; accordingly two great roads connected London with the lines of Hadrian, one going westward to Chester, swerving east to York, the northern Prefect's quarters, and then westward to Bowness. This is the famous Watling-street, which was one of the King's roads in the Anglo-Saxon times. A second road, afterwards Ermine-street, went north from London through Bedfordshire to York. A third passed through Colchester, Cambridgeshire, and Lincoln, turned off to York, and then eastward to the Wall. Akemen-street, whose barbarous name commemorates the Bath Waters, connected that city, through Speen and Wallingford, with London. The line from Chester to Carleon, important as a military frontier, and leading through a mining district, was fringed with Roman towns, while the Foss and Rykneld ways connected Lincoln and York with Bath and with the estuary of the Severn. By the Roman law, everyone, without distinction of degree or person, was subjected to contribute to the repairs of the roads and bridges. The roads thus made by the Romans would appear to have been adopted by the Saxons on their occupying Great Britain, for Bacon says that "anciently there were but four highways in England which were free and common to all the King's subjects;" and a note remarks that the "Trinoda Necessitas"—which was a threefold necessary tax to which all landowners were liable in Saxon times for repairing of bridges and roads and maintaining castles and garrisons for defence, &c.—lay on all lands in England, and that those four highways, the work of the Romans, were Watlingstreet, Ikenildstreet, Fosse, and Erminestreet, of which two, say the laws of Edward the Confessor (ch. 12), extend the length of the kingdom, and two the breadth, and that they were put by those laws within the King's Peace, a privilege which was conferred upon them by the 30th chapter of the Conqueror's laws. Having traced the origin of highways in England, let us now see how many kinds of such ways exist at this day. My Lord Coke says there are three—first, a footway: then a pack and prime way, which is both a horse and footway; and thirdly, a cartway, which contains the other two as well as a cartway, and that any of such ways which are common to all the King's subjects, whether it leads directly to a market town, or only from town to town, may properly be called a highway, and that any such cartway may be called the King's highway. The Roman law, compulsory on all as we have seen, appears to have been succeeded by the "Trinoda Necessitas," or threefold necessary tax of the Saxons. The first statute I find, subsequent to William the Conqueror, on the subject of the repairs of highways, is one in 1285 (Edw. I., 13 cap. 5) by which it is commanded that highways leading from one market town to another shall be enlarged, so that there be neither dyke, tree, nor bush, whereby a man may lurk to do hurt, within 200 ft. of the one side and 200 ft. of the other side of the way; but

the statute was not to extend to cutting down ashes or other great trees, which were to be cleared underneath, and the lord that would not abate the dyke, underwood, or bushes was to be answerable for two robberies committed therein, and if murder was done that lord was to pay a fine at the King's pleasure. If the lord could not fell the underwoods the country was to aid him therein. The general laws of highways seem not to have kept pace with the requirements of the times, for a little more than two centuries and a-half afterwards—1555, 2nd and 3rd Phil. and Mary, chap. 8—a statute was passed for mending highways, the preamble of that statute being, "For amending of highways, being now both very noisome and tedious to travel in, and dangerous to all passengers and carriages." By this statute the constables and churchwardens of every parish were in Easter week to choose two honest persons of the parish to be surveyors and orderers for one year of the works for amendment of the highways, in their parish, leading to any market town; and four days were appointed for the amendment of the highways in which ever person occupying every ploughland in tillage or pasture, and every other person keeping there a draught or plough, and every other householder and every cottager and labourer of the parish able to labour, and being no hired servant by the year, should do such work on the highways on the said four days, or pay such penalties as are therein mentioned. (I may state here that a ploughland in respect of repairing the highways was land of the value of £50 a-year.) Until this Act was passed it did not appear incumbent on any particular officer or person to call the parish together, and set them upon this work; and it was for this reason, says Sir W. Blackstone, in his "Commentaries on the Laws of England," that this statute was passed appointing surveyors. In a footnote Mr. Dalton tells us this office exactly answers that of "Curatores Viarum" of the Romans, or the persons whose duty it was to keep the roads in repair; but it would seem that theirs was an office of rather more dignity and authority than ours, not only from comparing the method of making and of mending the Roman ways with those of country parishes, but also because one "Thermus," who was the curator of the Flaminian way, was candidate for the consulship with Julius Caesar. This statute of Phil. and Mary, 1555, appears to have inaugurated what was termed "statute duty," and was for seven years only. In 1562, the fifth year of the reign of Queen Elizabeth, an Act (chap. 13) was passed for continuing the Act of Phil. and Mary for 20 years from that period. This Act enabled the surveyors to take materials from any man's grounds, without consent, for mending the highways, and to turn any of the water courses, of which the Act states the highways were then so full as to make the highways very deep and dangerous, into any ditch, or the soil of any person adjoining the highways. It also extended the number of days for doing that labour from four to six days. Previous to the passing of this Act the surveyors did not possess those powers to take materials for the repair of the highways or to turn the water-courses. Doubts arose upon the construction of Acts of Parliament in those days, and defects were discovered in them then as well as now. This led in 1576 to the passing of the Act of 18 Elizabeth, by which it was ordained "that any person, except those dwelling in the city of London, that shall be assessed to the payment of any subsidy to her Majesty to £5 in goods, or 40s. in lands or above, and being none of the parties chargeable to the amendment of highways by any former law, but as a cottager, shall find two able men yearly to labour in the highways"—the Act of Philip and Mary requiring every householder, cottager, and labourer of the parish to provide one sufficient labourer only. Before proceeding further let us rightly understand the meaning of being assessed to the payment of any subsidy to her Majesty to £5 in goods. By ancient writers we are told that a subsidy signifies an aid tax or tribute granted to the King for the urgent occasions of the kingdom, to be levied on every subject of ability according to the value of his lands or goods. This statute of 18 Elizabeth is the first to recognise the equity of requiring owners of personal property, as such, to contribute towards the repairs of highways as well as owners of land and their tenants. I now pass on to the year 1670 (22nd Charles II. ch. 12), by which it was enacted that in such places where there is no use of carts and teams for the amendment of the highways, but the practice is to carry material on the backs of horses or by any other kind of carriages, that in all such places the inhabitants using such

horses or other carriages shall send able persons to work with such horses or carriages, in like manner as in any former statute, for repairing of highways is appointed for carts and teams. And by section 10 of the same statute it is enacted that where the Justices of the Peace, at their general quarter sessions, shall be satisfied that any of the highways in any township, parish, or hamlet would not be sufficiently repaired without the help of this present act, assessments upon all and every inhabitants, owners, and occupiers of lands and houses, or any personal estate usually rateable to the poor, shall be made, levied, and collected in such manner as the justices shall direct, provided that no such assessment to be made in any one year shall exceed 6d. in the £ on the yearly value of the lands and houses, or the rate of 6d. in £20 on personal estate. I now come to the year 1691, when an act was passed in 3rd and 4th of William and Mary (ch. 12), and that statute will show us the then mind of the legislature on this subject. The preamble runs thus—"Whereas the free and easy intercourse and means of conveying and carrying goods and merchandises from one market town to another contributes very much to the advancement of trade, increase of wealth, and raising the value of lands as well as to the ease and convenience of the subject in general, for which ends therefore divers good and necessary laws have been heretofore made for the enlarging, repairing, and mending the highways and roads of this kingdom. Notwithstanding which laws the same are not in many parts sufficiently amended or repaired, but remained almost impassable, all which is occasioned not only by reason of some ambiguities in the said laws, but by want of a sufficient provision to compel the execution of the same." By that statute the Surveyor of the Highways was to give notice to the justices at their special sessions of the amount expended in the repairing of his highways, and the justices were to cause an equal rate to be made for reimbursing the surveyor upon all the inhabitants of such parish, according to the rules prescribed in an Act of the 40th year of the late Queen Elizabeth, intituled an Act for the better relief of the poor of this kingdom, and the assessment was not to exceed a rate of 6d. in £1 on the yearly value of the lands or houses, or 6d. in £20 on personal estate. In 1697, A.D., the 8th and 9th William III., chap. 16, gave justices in quarter sessions power to widen the roads, not to exceed eight yards, and to take lands requisite for the same; the price to be paid to the owner not to exceed 20 year's purchase, to be assessed by a jury, and assessments not to exceed the amount before stated were to be levied on the inhabitants for purchasing the land. About 70 years afterwards—namely, in 1766, the 7th George III., chap. 42, was passed for the purpose of explaining and amending, and reducing into one Act of Parliament the several statutes then in being for the amendment and preservation of the public highways of the kingdom. By that Act persons liable to perform statute duty were permitted to compound for it; should, however, the statute duty actually performed and the money paid for composition not have sufficed to pay the expense of the highways, the justices of the peace at quarter sessions, upon the application of the surveyor, would order a rate to be made upon the occupiers of lands, tenements, and hereditaments, within the parish, to raise the amount required, the amount of rate being limited to 6d. in the £ on the yearly value of the lands, &c. By this Act it will be observed that personal property, after having contributed to the expenses of highways for about two centuries, was set free, and the burden altogether imposed on land. In the short space of seven years (1773), another Act of Parliament—the 13th George III., chap. 78—was passed for the purpose of explaining, amending, and reducing into one Act of Parliament the statutes then in being for the amendment and preservation of the public highways in England, which contains similar powers to those mentioned in the Act of 1766 for raising any deficiency occurring in the expense of maintaining the highways by statute-duty, but the power of assessing was raised from 6d. to 9d. in the £ by the year. The British Parliament rested from its labours on the subject of highway legislation for about 63 years, and then in the year 1836 came the Act of 5 and 6 William IV., chap. 50, which was to consolidate and amend the laws relating to highways in England. It would be foreign to my purpose to discuss the provisions of this Act, numbering 120 clauses; but it gave permissive power to parishes to form themselves into a highway district, and to nominate a district surveyor, and in large

parishes of above 5,000 the vestry had the power to form a highway board. Statute duty was virtually abolished by this statute as the only mode it gave for raising money for the repairs of the highways was by a rate to be made by the surveyor upon all property then liable to be rated to the relief of the poor, and to be allowed by justices in the same manner as the poor rate. The amount was not to exceed at any one time or rate 10d. in the £, or 2s. 6d. in the £ in any one year. It contained also a provision that with the consent of four-fifths of the inhabitants of any parish assembled in vestry and contributing to the highway rate, the rate might be increased to such a sum as the assembled inhabitants should think proper. Having now briefly, but I fear very imperfectly, brought before you the origin of highways in England, the laws and customs which provide for their making or expenses of repairing, and the property of persons liable to those expenses, I come now, after the lapse of a quarter of a century, to the year 1862, when the highway reformers succeeded in obtaining the Highway Act (25 and 26 Vic.), and they may have obtained their ideas for the formation of the districts and boards which have subsequently been formed from the Act of 1835. With the machinery and working of this Act and of the Highway Act of 1864 passed to amend the Highway Act of 1862, you are many of you, as members of highway boards, well acquainted. The working of the machinery of the Acts of 1862 and 1864 has, without doubt, thrown upon parishes expenses to which they were not previously liable, and whether they and the public generally will derive benefits commensurate with the expense is a problem which time only can solve. The question of whether or not it be just and fair that the vast multitude of persons engaged in commerce and trade should go free from highway rates, when they not only use and travel on the highways equally with, but with far heavier loads, than the occupiers of lands, must, in my opinion, be answered in the negative. Beyond contradiction they derive as much or more benefit from good roads than the occupiers of lands who pay for the repairs. The country and the Parliament thought so in the year 1691, or the statement in the preamble of the Act 3 and 4 William and Mary, that the free and easy intercourse and means of conveying and carrying goods and merchandise from one market town to another contributes very much to the advancement of trade, increase of wealth, and raising the value of lands, as well as to the ease and convenience of the subject in general, would not have been made. Is not that statement as true at the present day as it was then? Are not good and commodious highways as requisite for the advancement of the trade of this country, the increase of its wealth, the raising the value of its lands, and the ease and convenience of its inhabitants generally, as a good and efficient army and navy are for its safety, and as a good, talented, and honest Government is for its welfare and honour among nations? If so, why should not all contribute in due proportion, and according to their ability towards the maintenance of its highways? The present Legislature appears to think that not only should the occupiers of land exclusively bear the expense of maintaining all the present highways not being turnpikes, but that they should be further burdened with the repairs of all turnpike roads, when and as they shall cease to be such. For by an Act passed in August last (the Annual Turnpikes' Acts Continuance Act) the cost of maintaining so much of any turnpike road as passes through any highway district constituted under the Highway Acts of 1862 and 1864, which has ceased, or shall at any time thereafter cease to be a turnpike shall, after 31st December, 1870, be a charge on the common fund of such highway district. Gentlemen, I have now endeavoured, to the best of my ability, to show you the present tendency of legislation in regard to the repairs of the highways in England. But when I look at the enormously-increased and increasing wealth, and numbers of those engaged in commerce and trade, as well as of those who draw their wealth from other sources than occupying land, and the consequently increased use by them of our highways, and contrast them with the wealth and population of this country in 1691, I can form unhesitatingly but one opinion—that opinion is, that the preamble of the statute of William and Mary is specially applicable to the present day, and that it would be but scant justice to the occupiers of lands that personal property, which was then, although in a very mild degree, rateable to the repairs of the highways, should now be made to contribute with the occupiers of lands its fair quota towards

the repairs of the highways in England. I fear I have tired your patience, and if I have, I ought, and I do thank you the more for the attention which you have shown me, which is only another instance of the many kindnesses I have received at your hands.

Mr. R. GENGE said: It seemed that as civilisation increased so did the number of good roads increase. A good road might be considered as a mark of civilization. The Romans, the most civilised of all the nations, were excellent road makers. The mulcting of a certain class of the community—occupiers of land—for the public good seemed also to be connected with the march of civilisation. It was high time that these things should be taken notice of, that, as Mr. Andrews had observed, personal as well as real property should contribute towards the expenses of the State. The working of the Act of 1862 had certainly been tested long enough to afford the opportunity of forming a good opinion as to whether it was beneficial. In many parts of the country the roads had, he thought, certainly improved, but whether in proportion to the cost was another question. If previous Acts had been well carried out, that of 1862 would not, he thought, have been required. He believed it was formerly in the power of the justices to take the necessary steps for putting roads in proper repair, and they could do no more now. There was at present a Board, in connection with which was a staff of efficient officers, and of course there were accompanying expenses. It was a great comfort, all must admit, to have good roads in going about the country; everybody must appreciate them, but then there was the serious question of expense which would lead to the great question of rating. It would be unwise, perhaps, to go into the latter at present. He should only be too happy to see all rates paid by the owners instead of the occupiers of property; if landlords were sufficiently interested in taking up matters of rating they would come before the public more effectually than when brought forward by the occupiers, who now felt the pinch. If the rates were all paid by the owners the occupiers would of course have to pay an equivalent in rent; they would know what they had to pay. Under that system the rates would be paid by those persons most interested in keeping them down. Certainly he considered a great injustice would be suffered if the maintenance of the turnpikes in this country was thrown upon the parishes, which appeared to be the object of recent legislation that had taken place. Mr. Genge considered it would be an injustice for persons who did not use roads to be compelled to pay for those who sent over the roads heavy loads of flour and other articles.

Mr. DAMEN said if Mr. Hugessen's bill were carried out—and no doubt it would be, for it was already partly passed—the additional expenses to be met would be somewhat alarming. He (Mr. Damen) saw that there were in this country 17,000 miles of turnpike roads to be maintained, the debt on those roads being near £3,000,000. In this county alone there were 433 miles of turnpike roads, the debt amounting to £94,000. Now let them just fancy that—the parishes being saddled with the keeping in repair of 433 miles of turnpike roads, to say nothing of the debt of £94,000! If the tolls were abolished this sum would have to be paid; no doubt that was the intention of the Legislature. The payment of this, reckoned at 3 per cent., would amount, perhaps, to £3,000 a-year, extending over 30 years. This he looked upon as one of the most monstrous things that could possibly be. He was in favour of persons being called upon to pay their share of the burden according to their ability, but to do more than that would, he held, be unfair. To charge all classes with the expenses according to their ability, would be as easy as possible, but to throw these expenses on a few for the benefit of the general public would be unfair.

Mr. T. A. HOMER considered that the burden of maintaining the roads should fall upon the community at large; it would be hard for the occupiers of land to be burdened exclusively. Reference had been made to the cottager earning his 8s. or 9s. weekly having to pay rates while personal pro-

perty—stock-in-trade for instance—was exempt; that he took to be a hardship. It seemed to him that they should do all they could in order that every one should bear his fair share of the burden.

Dr. ALDRIDGE said it struck him that the maintenance of the highways should fall upon each county, by means of a highway rate levied on all available property. Persons, he thought, should be called upon to pay such rate the same as they were now called upon to pay upon their income and property for other purposes. Every person in the country who derived an income from trade or landed property should pay a fair proportion. Good roads were absolutely necessary for the success of commerce and other interests, and therefore everyone, according to his position, according to the property which he held, should be made to contribute towards their maintenance. With regard to turnpike trusts he thought the sooner they were done away with the better; they were a great imposition. The expense of collecting the tolls was something enormous, and then again there was a sad want of economy in making the roads. Between Dorchester and Frampton, passing through Charminster, there were no less than three turnpikes. If the road had been managed properly it would long ago have been made free. The sooner tolls were abolished the better. The maintenance of highways and turnpikes should fall in the shape of a county-rate upon every one in the county possessed of property. As the subject was now on the *tapis*, as it would shortly be again brought before the House of Commons, it was, as he conceived, the positive duty of every Farmers' Club to petition Parliament to the effect that all properties should pay a fair share towards the maintenance of highways, at the same time opposing any such bill as that which had been spoken of as being introduced into the House.

Mr. A. POPE suggested the imposition of a tax upon every vehicle and every horse, raising thereby, if possible, a sufficient sum to maintain the highways. Then the burden would, he thought, fall on the right shoulders—on the persons who used the highways—and the noxious and inconvenient system of tolls would, to a certain extent, be abolished. This suggestion, he added, had never yet been brought before the House of Commons, and he did not know that it was likely to be (laughter).

The PRESIDENT said the first thing he would speak of was the present state of the roads. They could very plainly see that the Turnpike Trustees were, at the present moment, neglecting the turnpikes throughout the county. Certainly the Dorchester and Martinstown road was one of the worst roads he had ever in his life. The parish roads were quite in order; but it was otherwise with the turnpike roads. There prevailed a general impression that the roads would next year be thrown out of the hands of the Turnpike Trustees. The expenses attending their own roads had, they all knew, been enormous—they not increased double, but treble and treble. He felt that the increasing expenses must eventually be borne by the landlords, that the tenants could never pay them. A good deal of money was, he held, spent in an extremely extravagant manner. Taking up an old way-book of his parish, he found that from 1859 to 1863 the sum spent on the roads was £21 11s. 6d., while during the past four years, from 1867 to 1871 the sum of £226 would have been paid (Sensation). Thus the expense was now tenfold. Mr. Homer, in contending that money had been unnecessarily spent on the roads, instanced a case in which £40 or £50 had been voted for a road (that leading from Ashton to Monkton) while scarcely ten vehicles had passed over it during the past 2 or 3 years. The road he said ran through one piece of land. Last year or the year before thistles as tall as himself (Mr. Homer) and turnips as big as a decanter grew there. That was the way their money was spent. He also gave an instance of a road leading into a mud hole.

Mr. ANDREWS having replied, a vote of thanks passed to him, and the proceedings ended.

THE BREEDING AND MANAGEMENT OF SHEEP.

At the monthly meeting of the Breconshire Chamber of Agriculture, COLONEL BRIDGWATER, the Chairman, said he wished to inform the Chamber that at the last meeting of the Court of Quarter Sessions it was decided by the magistrates present that a committee should be formed, consisting of Penry Williams, Esq., the county and borough members, Sir Joseph Bailey, Bart., and Colonel Bridgwater, to draw up a memorial to be presented to Parliament on the subject of local taxation. He was sure that announcement would be the more gratifying to the Chamber because the magistrates had not been solicited by them, but had taken the step of their own accord. He therefore thought it would be advisable that the Chamber should send up a similar memorial, not in the same words but to the same effect. That, in fact, was being done, or about to be done, by most of the Chambers of Agriculture throughout the country, and he thought it would be well for them to do the same. He also suggested that the Brecon and Trecastle Agricultural Society should adopt and present a similar memorial. Thus, by uniting together, the agricultural interest would make its voice to be heard, and in all probability would influence very materially any future legislation on the subject. It would be advisable, he thought, for the Chamber to take the same course as the Court of Quarter Sessions had done; namely, to draw up a petition, and send it to Parliament in the name of the Chamber, and for that it would perhaps be advisable to empower the council of the Chamber to draw up and send a petition in the name of the Chamber.

Mr. OVERTON said they had already had a long discussion on the subject. His individual opinion was, that the burdens on land had not increased in the same ratio with the increase in the value of land; in fact, in nothing like the same ratio. He did not think anything would be gained by adopting the memorial to be presented to Parliament. There had, indeed, already been an investigation on the subject, when it was proved that land was not rated in proportion to its increased value.

Mr. LLOYD proposed, "That the council of this Chamber be empowered by this general meeting of the Chamber to draw up a memorial to be presented to Parliament, on the subject of Local Taxation."

Col. BRIDGWATER seconded the proposition, which was assented to.

Mr. STRATTON, of Duffryn Farm, Newport, Monmouthshire, then read the following paper: I propose to speak only of ordinary sheep-farming, if I may so use the word—I mean sheep-farming for the ordinary market, or £ s. d. point of view. I know nothing about the fancy side of the question, trimming for exhibition, or any of that kind of thing. I have no particular predilection for the animals—I either like them or detest them as they are profitable or unprofitable. And here is a point which I think we too often omit to consider. A man has his usual stock; he keeps them on in the usual way; he changes them from one kind of keep to the other, as the course of the season comes round; he has his usual lot of tegs or what not to sell at the usual time; they go, and he has so much money more or less than the year before, as the case may be. Does he consider, and can he tell us when or on what keep they have been paying best, and where they have paid least, or even lost money? Now, I think, we should be richer men, or rather, I would say, less poor, for I am speaking to farmers, if we more frequently asked ourselves the question, Is our stock paying? and after calculating the costs and seeing where it pays, and where it loses, endeavour in future to cleave to the one and despise the other. Now, of all the different branches of farming, I think the management of sheep is the most difficult to understand. Somebody once said of war it is a series of blunders, and the one that makes fewest gets the best of it; so, I think, it may well be said of farming, especially of sheep-farming. We hear every spring the question, always the first question a brother-farmer asks you, what luck with the sheep or with the lambs? Depend upon it the answer to that question is a pretty good indication of the

management of the flock; for though I must admit that the best of managers do sometimes meet with bad luck, as it is called, I do believe that bad management is generally the parent of bad luck, and *vice versa*. At all events, I know that when I myself have had very bad luck, I could frequently remember a bit of bad generalship a month or two before. In sheep-farming I do believe that to make it profitable you must manage very well indeed, and sheep badly done are a most unprofitable stock. So I think you could not have chosen a subject more worthy of our consideration and discussion, and I think we shall find, after calculating all costs, that there are more unprofitable sheep kept in this kingdom than is generally imagined. I have heard clever farmers say that sheep are a necessary evil, that they pay nothing in themselves, but are only necessary for corn-growing. With this I for one cannot agree. I believe that sheep managed as they ought to be should not be kept in excessive numbers to interfere with corn-growing, which I have frequently seen done. Have you not often seen roots kept about too late in the spring so as to ruin a barley crop? And, remember, it takes the profit of a good many sheep to make up the difference between the value of 20 acres of bad barley and an equal quantity of good. I now propose to say a few words in detail about the management of a breeding flock, with my humble notions as to its proper management. Of course the first question to be decided in commencing sheep-farming is the sort of sheep you intend to keep, and this is a question dependent upon such a variety of circumstances that it would be preposterous to offer an opinion; but, as a rule, I think, to begin with, it is wise to do as your neighbours do, only improve upon them (I mean the sheep of course) as much as possible; it would be perfect madness to put heavy sheep on your mountains, though, possibly, they might with advantage be made a little heavier than they now are; but mountain farming is one thing which I cannot understand. I cannot understand what pay there can be to a Welsh wether, for instance, from one year old till six, when, I believe, he is generally worth from 25s. to 30s., the wool at 10d. or 1s. per lb. about makes up for losses; so it appears to me that he pays, with *luck* mind you, about 1s. a year for four or five years. This cannot be making money very rapidly. I verily believe your mountain farmers, for no doubt you are all sportsmen, keep these sheep to afford a good chase for your dogs; and here let me say that I believe the mischief caused by dogging is incalculable—it's the curse of Welsh sheep farming. No sheep can thrive if they are to be run to a stand still constantly. Why, in Wiltshire and every other sheep county I know of, the very first principle of sheep management is to be as quiet and gentle as possible, never disturb the sheep in the smallest degree, but hereabouts the dog does everything. A man sits in his house, tells the dog to go round the hill and bring the sheep home, that he may see if they have "gruba." Your dogs are wonderfully intelligent, and no doubt they save their owners many a long walk, but they certainly diminish the mutton of the country to a very considerable extent. Perhaps it improves the flavour, as couraing is said to do of the hare; and as we have nothing extra to pay for it, perhaps we had better say nothing about it. But let us return to our breeding flock; and here let me say that it should be a point of very deep consideration whether according to the peculiarities of this or that form, a breeding flock is the right thing to keep, or whether a dry flock would not be more profitable. Of course in this matter everything depends upon circumstances, but I think one rule may be laid down in reference to this matter, viz., do not keep a regular breeding flock unless you have sufficient rough keep, either mountain run, or other inferior keep to maintain your ewes from weaning time till near tuppings time, for if they are kept on costly food, the expenses of summing will very considerably diminish the profits. My own plan is to buy in full-mouthed ewes, generally in August, keep them always pretty well, sell as many fat lambs as I can, and graze out the ewes during the autumn. My reasons for buying in a fresh lot every year are, in the first place, that I have no

sheep walk where I can keep my ewes inexpensively; secondly, I like old ewes. They breed a larger number of lambs, and that better than young ewes. Now, having weaned the lambs, I think we all know that it is quite unnecessary to fatten our breeding ewes. It does them good to work for their living, only to mind they do not get too poor, and that they are well supplied with water during the hot weather. It is not until within a month of tugging that one need be at all anxious about the ewes. I think it is then of great importance to keep them well. They should be decidedly on the mend when the ram is turned out, for we all know how our breed of lambs varies as the ewes are doing well, or are poor and doing ill. Now comes a very interesting period, when the health of our subject should be carefully watched, for a little neglect will spoil the whole thing. Once let your ewes get below the mark do what you will, you can't get them up again. You will have puny, starved lambs, the ewe can't keep more than one, and often not that. You will have a short breed of lambs, and lose a number of ewes. In short, you will have *very bad luck*. Let us just try to calculate the difference between a flock done well and a similar lot done badly. Let there be 200 Down ewes. They shall be run in two lots of 100 each. And here I will describe my notions of how a flock of ewes should be kept. They shall cost 35s. a head, and be purchased in August. They both shall run stubbles, and be kept in a similar way, only that one lot shall have a tie of rape or mustard for a month previous to a *certain* time, so that one lot shall be in a good state, and the other a little below par at that particular time; then they run the seeds and pastures, or clean up behind the lambs; they are still upon much the same keep, but one lot is frequently changed from field to field, the other kept a bit too long in one place. The shepherd has the lambs to attend to in the morning, and keeps our devoted ewes too long in a bare fold, where they had finished up the bits left by the lambs six o'clock on the previous evening. They continue to run the pastures, when November comes with its usual rains; the one lot is immediately removed to the drier grounds, where a bite has been kept in anticipation of this period; the other lot remains a few days, perhaps weeks, too long on wet comfortable ground, the bit of grass there is dirty and loathsome from the constant wanderings of the dissatisfied ewes. December comes, but without frost; the good manager still keeps his flock on the dry ground, but either hauls them a few turnips or makes them walk to the field and fetch them themselves; the bad manager begins to think his ewes look deuced rough, is frightened, takes them away from the grass, and plunges into a piece of turnips, gives them as many turnips as they can gorge, and hay, which they don't care about, having plenty of turnips, keeps them between the hurdles often in mud up to their bellies. This goes on till January comes with its frosts, when our friend finds his roots decreasing apace, and the hay ricks diminished visibly; gets frightened again, curtails the turnips, and cuts straw with hay into chaff; the consequence is that the ewes are always looking for the turnips, rush at them when the time comes, take in a considerable amount of wind, and consequently feel uncomfortable. Then may be expected a pretty good crop of dead lambs. So the game goes on till lambing time, when our friend finds himself in a very unsatisfactory state as regards his 100 Down ewes; in all probability he has lost four or five. He has few twins, and even the singles have not sufficient milk. He finds when weaning and shearing time comes that he has lost ten ewes, and has only eighty lambs, and those are a bad lot. Now, what does our good manager do? We left him in December with his stock in a very healthy state. In January, or as soon as they require it, he gives a little cake, and perhaps a bit of chaff, or a picking of nice oat, barley, bean, or pea-straw, and so they are continued to be kept until lambing time, always in comfort, always in health. Observe, I have not mentioned hay as part of their diet. I very seldom use hay myself for sheep, and I am quite satisfied that it is quite unnecessary; and at anything like average market price, it is one of the dearest articles you can consume, and not to be compared to cake or corn as an economical feeding stuff. I have known a flock of ewes eat more hay in a season than they themselves were worth. Can that be right? and what is the reason? Why, some absurd restriction about selling hay, probably. Fancy being compelled to consume hay worth £7 per ton, when

you can use cake so much more economically, and will any one say that cake feeding is not better for the land? Moreover, I object to giving ewes an excessive quantity of roots, before lambing. I believe a large amount of ill-luck is to be accounted for in this way. Now, the owner of the flock I am now describing will find himself, in all probability, at weaning time, with about 98 ewes and 130 lambs. The ewes will keep the lambs well and give them a good start, which is everything with a lamb. Once get a young lamb "dry" in its skin, as we call it—I mean pinched—and with its back up—and you may move him if you can; he is injured for life. The parallel which I have been drawing in a very rough way, I believe to be by no means an unusual one in real life, and I leave you to draw your own inference of the difference between profit and loss in these two cases. Why, one lot would be worth almost double as much as the other, and yet probably have cost no more to keep. No wonder that some men like sheep while others hate them, that some are "lucky," others unlucky. I believe the great principle of sheep farming is to *keep them moving*! I mean increasing in weight. I am not recommending "dogging," mind. If a sheep once sustains a check, it takes probably a month to start him again, and all the food he eats during that period is simply wasted. What does M'Combie say of cattle? "If you want them to pay, they should never lose their calf-flesh, depend upon it." It is quite equally true of sheep, they should never lose their lamb-flesh. I expect we are all pretty well agreed that in sheep-business nothing pays better than selling fat lambs, and no doubt, as a rule, it is quite true; but if it were possible to keep them on for another six months, always doing as well as when with their dams, and with good keeping, it is quite possible, I believe, the latter part of their lives would be as profitable as their beginning. Take for instance the prize lots of lambs at Winchester Fair, in October last. The 300 made over £3 a head, and you may reckon up the cost of keeping them as you like; you can come to only one conclusion, namely, that they paid right well. Now, you may depend upon it, they were kept "doing" the whole time. I will here say that the dams of the first prize lot have tasted no hay for two or three years. And the principal food of the lambs was vetches, sainfoin, and cabbage. I will not pursue the daily life of a lamb from its birth to its death, for that would be asking too much endurance from you. I will simply say that I believe it is very essential to give young lambs a succession of *fresh* keep if hurdling be the system adopted; let them at least have one fresh piece every day; and if the system of grazing the whole field be adopted, on no account let the keep get too big before stocking, and when stocked don't keep them there too long, remembering that for every day they remain there after your keep is stale they will take two days of good keep to make up what they have lost. Rely upon it, for sheep to do well upon seeds or grass, they should be pastured in moderate numbers with other stock, and frequently shifted from one field to another, always having the opportunity of obtaining good water. There's an old saying, "If you want more milk, sell a cow." The same may be applied to sheep, "Do not over-stock." A few sheep well done will pay a lot more than a large number done badly. Over stock with sheep and you spoil your sheep and spoil your land. Here let me say that I think wherever possible there's nothing like keeping sheep between hurdles. They are not only spared a lot of injurious exercise—I speak of grazing sheep—but you get the full benefit of the manure, which when sheep are allowed to run over the field, is, to a great extent, wasted under hedges and trees, or where it is not required. I am of opinion that it is unwise, as a rule, to keep young sheep on pasture too late in the autumn; or rather, I should say, get them on to roots as soon as you can. I believe a ton of swedes in October will produce as much mutton as two tons after Christmas, unless very carefully secured, and even then they are not nearly so good, or, at all events, they do not make mutton so fast; but that perhaps may be on account of the difference in the state of the land and the atmosphere; but whatever the cause, the result is the same. I like to get on to swedes or mangolds by the 1st October. My own plan is to give them as many roots as they will eat. I speak of fattening sheep with about a pound of cake or corn per day. No hay! I find the sheep, as a rule, do very well and pay me a fair price for my roots. I find 1 lb. of cake per day and

20 lbs. of roots to be about the average quantity a fair sized "teg" will consume, and reckoning in this way, I have been always able to calculate the time my roots would last me, and this is sometimes useful to know. There is a prevailing notion that mangolds are unfit to feed, with sheep on the land in autumn. This is, I venture to say, a great mistake. I would quite as soon have mangolds as swedes in October, November, or December; and as they are a much more certain crop, I shall go in for a very large proportion of mangolds. I have fattened a lot of sheep on mangolds this last autumn, and never had sheep do better. In conclusion let me say that to be successful in the breeding and management of sheep—I mean successful in a pecuniary way—like all other branches of business, it must be thoroughly understood and well carried out. We must think over our blunders and profit by them, and not go and commit the same blunders again. We must look our mistakes fairly in the face, and not slur over them, and call it all ill luck. I am here reminded of two very big blunders of my own only last year. I know it is generally thought that any fool can be a farmer—and so he can in name; but I am sure you will agree with me that any fool can't make money at farming. I believe a prevailing error among farmers is a fear of expense. We too often spoil the ship for the sake of a half-penny worth of tar. The most profitable lot of sheep I ever remember were kept the most expensively: after paying for their corn, which they had *ad libitum*, they paid 30s. a ton for their roots.

The CHAIRMAN knew the hill sheep made very good mutton, and he should be pleased to hear some of them tell Mr. Stratton that they paid also.

Mr. DE WINTON said that in some humble way he had followed the plan advocated in the paper, though as yet he could not say that it had paid him, for the reason that he thought he had had what was termed bad luck with his sheep. Still he was not deterred, as he believed the principle advocated was the right one.

Mr. A. SMITH explained that it was his custom to give his sheep a little hay with their turnips, because turnips containing ninety per cent. of water were too poor for sheep at that time, and if fed on that root alone the consequence would almost certainly be a poor lambing season. He therefore gave his sheep a little hay, and believed it to be beneficial to them.

Mr. STRATTON said he also gave his sheep hay and cake as well as turnips at the time alluded to by Mr. Smith, and believed with him that that treatment was beneficial.

Mr. SMITH quite endorsed all Mr. Stratton had advanced on the evil of driving sheep with a dog. Such a practice was a very bad one, because after a run in that way the sheep became overheated; they would then lie down, and the probabilities were that it would prove very injurious to them.

The CHAIRMAN said that he thought Mr. Stratton's remarks were hardly fair on Welsh sheep farming. He appeared to condemn the practice of keeping sheep for six or seven years;

but it might be that they made better mutton by keeping them that time, and if so, the question simply turned upon a matter of paying. He did not think the same rule could be applied to Welsh sheep as was followed with English sheep. In fact, the real point was simply whether the Welsh farmer could do as well by selling his sheep at a year or two old as by keeping them longer. They must remember that Welsh sheep were quite different from English sheep in that they wandered over large tracts of common land for a greater part of the year, and their keep was therefore much less expensive than English sheep. The mountain sheep, too, were much more hardy than the lowland sheep, and considering this and other circumstances, it seemed to him that they required a very different kind of treatment.

Mr. JONES said he was very much impressed with some of Mr. Stratton's remarks respecting hill sheep, and he could not but say that a good deal he had said was quite true, and could not be controverted. Every shepherd who had a great quantity of sheep under his care, roaming over hundreds of acres of hill land, knew that a certain number of those sheep were what are termed leaders, that is, they were kept for a longer period, because they knew the runs or the boundary so well that they prevented the rest of the flock from straying.

Mr. STRATTON: But do they pay?

Mr. JONES: Very well.

Mr. D. SMITH pointed out that farmers whose farms adjoined mountain commons had the privilege of turning out their sheep on these commons for the greater part of the year, and in consequence, their feeding was much less expensive than the feeding of lowland sheep. It was the practice of these farmers to buy sheep a year old and then turn them on the commons for two or three years, at the end of which time they would realise 7d. per lb. in the market, and thereby give a clear profit because they had cost but little in keep.

Mr. OVERTON said that the Welsh farmers, on farms of over one hundred acres, were gradually reducing their stock of Welsh sheep. Indeed, the only reason that could be alleged for their continuation was the immense tracts of common lands which were only used for grazing purposes. These commons unfortunately were now open, but he considered it would be far better if they were enclosed. He believed that unenclosed commons were a great injury and a great curse to the country. They produced endless disputes and quarrels among the people who lived on and adjoining them, as was seen in the continual charges of assault heard before the magistrates arising therefrom. But he thought the day was not far distant when these commons would be enclosed, and then the hill farmers would probably keep a superior class of sheep. There was another reason for continuing this class of sheep, namely, that the land in many districts was too poor and too cold to support a superior breed.

Votes of thanks were accorded Mr. Stratton and the Chairman.

THE HEXHAM FARMERS' CLUB.

At the annual meeting, Mr. Joseph Lee, Dilston, in the chair, the officers of the Club were re-elected for the ensuing year, and the other business was of a formal character. The annual dinner was held at one o'clock, when about ninety gentlemen sat down, Mr. C. G. Grey, President of the Club, in the chair.

The SECRETARY (Mr. W. Trotter) read the annual report as follows: In presenting the twenty-fifth annual report, your committee have pleasure in observing that the Club still continues its prosperous career. The number of members increases, there now being 228 against 215 at our last annual meeting. The committee beg to express their thanks to the gentlemen who have read papers during the year, viz., to Mr. Wallis for his paper On Sewage, to Mr. Hugh Wilson for his paper On the Condition of the Agricultural Labourer, to Mr. W. F. Catchside for his papers On Oilcakes and On Lime, to Mr. H. B. Goddard On the Sterility of Soils, and to Mr. John Hope, jun., for his paper On the Commercial Aspect of Agriculture. The committee wish most particularly to draw your attention to the subjects on the card for discussion; the first of which, by Professor Wrightson, will not be read on the second Tuesday in Feb-

ruary, but on the first Tuesday—the 7th of February. Your committee, in compliance with a requisition from some of the members called a special meeting, which was held on the 15th of March, to consider the Game Law Bills then before the House of Commons. The meeting was numerously attended, and it was resolved to petition in favour of the total repeal of the Game Laws. The petition was forwarded to Mr. Beaumont, by whom it was presented to the House. Your committee beg to express their obligations to Mr. Beaumont for having kindly sent to the Club various Parliamentary returns and reports connected with agriculture. The committee have submitted to your chemist various samples of cakes and manures for analysis, and have pleasure in stating that the results are satisfactory; but they beg to add that the cakes which they selected are sold as "pure." Those sold as "genuine" and "common" have not been analysed. Your committee feeling that these analyses have been of benefit to the district desire your permission to continue them. The Club was kindly invited to witness the working of various steam cultivators on Mr. Lee's farm, Stocksfield Hall, in April; but it may be observed that the position of the field in which the trial took place and

the quality of the soil are well adapted for 'steam cultivation.

The CHAIRMAN moved the adoption of the report, which was carried.

The SECRETARY proposed a number of new members, who were elected.

Mr. WM. COOK then sold the agricultural papers taken in by the Club, disposing of the *Mark Lane Express* to Mr. M. Stephenson, jun., Fourstones, for 4d. per week, and the *North British Agriculturist* to Mr. J. J. Harle, West Mill Hills, for 2½d. per week.

The Secretary laid before the members a letter asking aid to a fund for providing money or seed to the tenant farmers in the north of France.

Mr. DODS moved that the committee be requested to undertake the collection of funds and seeds throughout the district, and that they select gentlemen in each parish to aid them.

Mr. JOS. LEE seconded the proposition.

The CHAIRMAN said it was an exceedingly laudable object, to benefit those who, from no fault of their own, had been brought to great loss. If peace should be concluded by the spring they would be able to sow their land.

The SECRETARY proposed that the Club take no action. If any nation, especially a rich country like France, chose to go to war, it was very fit that they protected themselves against all emergencies (hisses and slight applause).

There being no seconder to the amendment, the motion was carried.

Mr. DODS then read a paper on "Local Taxation" as follows: The subject of local taxation, on which I have undertaken to open the discussion, is one the growing importance of which is forcing itself upon the attention not only of those upon whom the burden of the local taxes falls, but also of public men of all shades of politics, and now, after many attempts at mending and patching, has again been taken up by the legislature with, let us hope, a determination by a comprehensive and just reform, to set the question at rest for at least one generation. The committee of last session will, I doubt not, be re-appointed as soon as Parliament meets, and as upon its final report it is most probable legislative measures regulating the raising and expenditure of some £16,000,000 will be based, I need not point out how important it is that the ratepayers and all who are interested in the question should make known their views in a calm, clear manner—not looking merely to their own interests, but endeavouring to ascertain what is best for all; and I trust that in this spirit I shall open the discussion, and that in this spirit it may be conducted. As the Act 43 Elizabeth, cap. 2, is that under authority of which a large portion of our local taxation is raised, and as it has the merit of being brief, I shall here quote it: "Be it enacted by the authority of this present Parliament that the church wardens of every parish, and four, three, or two substantial householders there, as shall be thought meet, having respect to the proportion and greatness of the same parish and parishes, be nominated yearly, in Easter week, or within one month after Easter, under hand and seal of two or more justices of the peace in the same county, whereof one to be of the quorum, dwelling in or near the same parish, or division where the same parish doth lie, shall be called overseers of the poor of the same parish; and they, or the greater part of them, shall take order from time to time, by and with the consent of two or more such justices of peace as is aforesaid, for setting to work the children of all such whose parents shall not, by the said churchwardens and overseers, or the greater part of them, be thought able to keep and maintain their children; and also for setting to work all such persons, married or unmarried, having no means to maintain them, and use no ordinary and daily trade of life to get their living by; and also to raise, weekly or otherwise (by taxation of every inhabitant, parson, vicar, and other, and of every occupier of lands, houses, tithes impropriate, appropriation of tithes, coal mines, or saleable underwood, in the said parish, in such competent sum and sums of money as they shall think fit), a convenient stock of flax, hemp, wool, thread, iron, and other ware and stuff, to set the poor on work; and also competent sums of money for and towards the necessary relief of the lame, impotent, old, blind, and such other among them being poor and not able to work; and also for the putting out of such children to be apprentices, to be gathered out of the same parish, according to the ability of the same parish, and to do and execute all other things, as

well for the disposing of the said stock as otherwise concerning the premises, as to them shall seem convenient." The duty of providing for the impotent poor was recognised so early as 1338, in the reign of Richard II. (a), but it was not till the suppression of the monasteries by Henry VIII., which dispersed over the kingdom the sturdy beggars hitherto supported by them, that the question forced itself on the attention of the Parliament. Acts providing for the collection of voluntary charity proved ineffectual, and at last the 43rd of Elizabeth was passed, which may be rewarded as the foundation of our poor-law system. By it the office of overseer was first called into existence. It will be seen, too, that it provides that the able-bodied poor shall be made to work, the impotent provided for, and poor children apprenticed and set to work, and also provides for raising the means of carrying out these provisions by a compulsory rate, "according to the ability of the *same parish*." The Act is very short compared with our Acts now-a-days, and seems very clear also, and yet how many different opinions have been expressed regarding it! and so many and conflicting have been the decisions of the superior courts upon it that its terms afford a fruitful source of litigation, even in our own days. Some hold, and Mr. Gardener, in his able essay on Local Taxation, goes the length of saying that no unprejudiced mind can doubt that personal property was intended by this act to be rated. If so, it is a very singular fact that no attempt to rate personalty was made from the days of Elizabeth till the reign of Anne. There is no doubt that since that time there have been many conflicting decisions; but latterly personalty, at least so far as to include stock-in-trade, was held to be rateable, but under so many restrictions and complications that to do so was next to impossible, and the legislature cut the knot by passing a short Act exempting personalty from rates. Your time, however, will not permit me to enter fully into that branch of the subject here. Those who wish to study the difficulties of rating personalty, I would refer to the exceedingly clear and able evidence of the late Sir George C. Lewis, before the Lords' Committee of 1850, on Parochial Assessment.

In treating this subject I shall consider

I.—The basis of assessment.

II.—The area of assessment.

III.—The parties from whom the rates should be levied.

IV.—The parties framing the assessments, and making, allowing, and collecting the rates.

V.—The parties administering the rates.

I. THE BASIS OF ASSESSMENT.—1. The present basis and its inequalities. Hitherto the rates have been charged only on real property, but every description of real property is not chargeable. With the exception of coal, all mines and woodlands (with some slight exceptions) are exempted, and also all quarries and claybeds which are wrought by shafts, and not "to the day." Thus the fire clay, so frequently found with coal, and so valuable an adjunct to the mine, is not rateable, while the coal going up the same shaft is so. Again, railways, water-works, and other descriptions of property which, within the last few years, have so largely increased in value have, through the ignorance or indolence of the overseers, either escaped rating altogether or been rated at a mere nominal sum. This may be seen by reference to the Board of Trade returns, from which it will be found that the fair rateable value of the railways in England and Wales in 1867 amounted to something like £12,000,000, on which they paid only £650,000 of rates, or about 1s. 1d. in the pound; whereas, according to Mr. Dudley Baxter (b), the average rate is 3s. in the pound on the rateable value of England and Wales. These inequalities are further increased by there being no central authority by which the assessment of the various unions may be made uniform one with another, so that the county and police rates are levied on an unequal basis. Again, the cost of the prosecution of felons and the maintenance of the police force fall entirely upon that portion of real property now rateable, while in 99 cases in 100 the offences are committed against personalty; and the question naturally arises, Why should a certain limited amount of real property bear not only all these expenses, but also that of maintaining the highways? Then we have general district rates for repayment of money borrowed for permanent works, such as sewerage, paving, water supply, &c., and also for maintenance of streets, lighting, scavenging, repairs, &c., all charged upon real property, and charged upon the whole

district under the Local Board, landward as well as town, although in many cases the land receives no benefit whatever from any of these works. No doubt it is charged at a lower rate, but can anyone say that *real property* alone is benefited by sewers, water, and light? *Real property* is already taxed beyond its just proportion; Mr. D. Baxter, in his interesting work on "The Taxation of the United Kingdom," says by $2\frac{1}{2}$ per cent., but I think I can show by his own figures that his estimate is too low. He states that real property ought to bear one-fifth more taxation than personalty, and industrial incomes one-fourth less than personalty, taking personalty as the standard. Now admitting this, how does the matter stand?

If personalty is paying taxes to the amount of 7 per cent.

Real property should pay 8 $2\frac{1}{5}$ ths, say $8\frac{1}{5}$ "

And industrial incomes $5\frac{1}{5}$ "

Now Mr. Baxter states that real property is paying 11 per cent., personalty 7 per cent., and industrial incomes only $3\frac{1}{5}$ per cent., real property thus bearing $2\frac{1}{5}$ per cent. above its normal amount. But what do his own figures show? The whole taxes, local and national, for 1867-8 amounted to £83,115,000. Of this amount the £162,600,000 of real property bore £24,938,375, or deducting one-fourth of the local taxes as being incident to the occupiers—£20,000,000, or $12\frac{1}{2}$ per cent. on the amount taxed. I have not the means of separating the amounts borne by personalty and industrial incomes respectively, but together they pay to the national exchequer £9,959,625 to which must be added the fourth of the local

taxes incident to the occupiers 4,930,375

Amounting together to £14,890,000 or six and two-thirds per cent. on the £223,400,000 returned for income-tax. To this add one-fifth for the amount at which it is claimed real property should be taxed beyond personalty, and we have still only 8 per cent., being $4\frac{1}{5}$ instead of $2\frac{1}{5}$ per cent. less than real property, and if to the amount returned for income-tax under schedules B, C, D, and E, £223,400,000 we add, 1. Unreturned income 17,000,000
2. The amount excused on incomes }
 between £100 and £200 } 12,300,000
3. Incomes under £100 81,300,000

In all £334,000,000

we find that only $4\frac{1}{5}$ per cent. is really borne by personalty and industrial incomes, and although real property is thus overtaxed, it is to have an education rate added to those I have already mentioned. The balance of the £83,115,000 is raised by taxes on expenditure and such licences and duties as are borne by the public at large. Another fruitful source of difficulty and dispute in framing the basis of assessment is the deductions for repairs, insurance, &c., also the rating of tithes upon the annual value, and the numerous deductions allowed therefrom.

2. One effect of these inequalities, exemptions, and anomalies has been to cause the present movement for a thorough revision of the whole system of local taxation, and a growing conviction that, for local purposes, every class and description of real property should be rated. There are also many who call for a rating of personal property, and refer to the Act of Elizabeth in support of their views. That these inequalities and exemptions are wrong in principle, and that all real property from which profit is or may be derived ought to be assessed, is almost universally admitted, and the carrying of this out in a fair and equitable manner is the difficult task to which Parliament will, we trust, address itself.

3. Let us now consider the remedies for these inequalities. Certainly not the rating of personal property for local purposes. If the difficulties of fixing an equitable basis of assessment for real property are great, those attending the framing of such a basis for assessing personal property for *local* purposes are to my mind, infinitely greater. Where is the personalty of those holding in the funds to be rated? In London or in the parish of residence? Or where are railway dividends to be rated, in the parish of residence, at the railway head-quarters, or distributed over all the parishes through which the railway passes? Sir G. C. Lewis says (*c*), "I never heard of any mode by which it would be practicable to levy a parochial rate on personal property," and in answer to the previous question he says, "as far as I am informed of the

details of rates made upon personal property, I doubt whether any such rate could be sustained on an appeal."

The rating of personal property—or "means and substance"—is expressly sanctioned in Scotland by the Act 8 and 9 Vic., c. 73, and attempts were made in several localities to carry it into effect, but with such unfortunate results that, with one single exception (Greenock), they are now abandoned. By that Act it is optional to the Parochial Boards to impose the assessment for the support of the poor in either of three different ways, viz. (1), one-half on the owners, and one-half on the occupiers of all lands and heritages in the parish rateably according to their annual value; or (2) one-half on owners of lands and heritages rateably according to their annual value, and the other half "upon the whole inhabitants, according to their means and substance other than lands and heritages situate in Great Britain or Ireland;" (3), by an assessment "imposed as an equal per centage upon the annual value of all lands and heritages within the parish or combination, and upon the estimated annual income of the whole inhabitants from means and substance other than lands and heritages situate in Great Britain or Ireland." In their first annual report the Board of Supervision (corresponding to the Poor Law Board) say, "We think it not very unlikely that the second and third modes of assessment mentioned in the Act may gradually be abandoned, and the first mode, with or without classification, be adopted by all, or nearly all, the parishes in Scotland." This expectation, after a large amount of litigation and ill-feeling, has been fulfilled, and Greenock alone, for what cause and with what results I know not, continues to assess "means and substance." It appears to me that for local purposes real property alone can be equitably rated, and that relief is not to be obtained by a direct rating of personal property, but

(A) By removing from the local rates, and paying from the national fund those charges which are *national* and not local. Those in which the whole community is quite as much concerned as the union, viz., the county expenditure for the prosecution of felons, maintenance of police force, &c. The maintenance of pauper lunatics, and of highways; the cost of proceedings before justices; payments on account of Registration Act; vaccination fees and expenses; the expenses of Parliamentary and Municipal Registration and of Jury Lists. All those are now paid out of the poor-rate, but should be paid out of the national funds. In this way personal property would be brought to share in the expenses of providing for its security, of maintaining the roads used in its increase and enjoyment, and of those other items I have named, which have hitherto been borne by real property alone, which, as we have already shown, is taxed at $4\frac{1}{5}$ per cent., but say 4 per cent. beyond its fair share. That is to say that £132,500,000 of real property charged under Schedule A in England and Wales pays at present over and above its fair share, taxes amounting to £5,300,000

Now, in 1869, the various items I have proposed to place upon the Consolidated Fund were as follows, viz.:

Payments to County, Hundred, Borough, or Police Rates	£2,564,735
Payments to Overseers to Highway Boards	658,469
Constables' Expenses, and cost of proceedings before Justices.....	42,823
Payments on account of Registration Act.....	76,735
Vaccination Fees and Expenses	64,378
Expenses allowed in respect of Parliamentary and Municipal Registration, and cost of Jury Lists.....	71,213
Maintenance of Pauper Lunatics.....	710,941

Total £4,189,294

But if these sums are paid from the Consolidated Fund, as the real property of the kingdom bears 9 per cent. of the National Taxation, in addition to all Local Rates, there would still fall upon it the sum of... 377,036

And upon the whole tax-paying community only £3,812,258

Leaving real property still overtaxed by £1,467,742

Of the £3,812,258, personalty and industrial incomes would pay £660,790, leaving £3,151,467 to be paid from taxes on expenditure, &c., of which *all* bear their share. In asking, therefore, to have the expense of these national objects paid from the national funds, I am asking only what is strictly just, and what was recommended by the Lords' Committee on Parochial Assessments in 1850.

Mr. Baxter proposes to relieve real property by a rate in aid of three-halfpence in the pound levied on sch. D and E (g). This would only yield the very inadequate relief of £910,475, and would moreover act as a continual irritant to those paying under those schedules, and would at once be denounced as class legislation, whereas the relief I have proposed above would be both more effectual, more just, and less of an irritant.

(B) By including in the assessment for local purposes all real property, from which profits are or may be derived—doing away with the distinction between “gross estimated rental,” and “rateable value,” abolishing all deductions for repairs and insurance. From the annual value of mines, quarries, and other property of a like nature, where the heritage is actually removed and consumed, deductions would require to be made to recoup the owner in a certain number of years. I am aware that the equity of this is denied by some authorities on rating, who hold that while the heritage is there it is liable to full rates, and when it ceases to exist the rate ceases, and if deductions to recoup are allowed, the rate should continue after the heritage is gone. Now I deny the justice of this view altogether, for not only is the risk of working this class of property greater, but the owner is not merely *letting* his property, he is selling so much of it year by year, and the purchase money will remain to be taxed to the national exchequer. All deductions, however, for mere repairs and insurance should be abolished, as well as those allowed from tithes.

(C) By applying to the rating for the poor the principle already sanctioned by the Local Government Act., viz., rating land at a lower amount than houses and shops. This principle is also sanctioned by the Scotch Poor Law Act 1845 (8 and 9 Vic., c. 73, sec. 36) where “the Parochial Board with concurrence of the Board of Supervision” may “direct that lands and heritages may be distinguished into two or more separate classes, according to the purposes for which such lands are used and occupied, and fix such rate of assessment upon the tenants and occupants of each class respectively, as to such Boards may seem just and equitable.” This principle is just, and should be extended to England. It has the support of the late Sir G. C. Lewis, and of Sir John McNeil, chairman of the Board of Supervision, and has given satisfaction in Scotland.

(D) By distinctly defining and giving legislative sanction to the principle on which the annual value of the various classes of real property is to be ascertained. The superior courts have already laid down the principle upon which coal mines are to be rated, viz., that to the rent paid to the owner is to be added the fair annual value of all buildings, engines, tramways, shafts, staiths, &c., provided by the tenant himself, deducting a certain per-centage to recoup the owner for the loss of his heritage, upon the same principle should all other mines and their adjuncts be rated. With regard to railways, docks, gas, and water-works, which are seldom or never let, the court has held that a hypothetical tenant must be assumed, and taking the gross earnings, and deducting therefrom the working expenses, interest on tenants' capital, and depreciation of permanent and rolling stock, have endeavoured to ascertain what annual rent such tenant might be expected to give. This is just the process a judicious farmer follows in offering for a farm. He calculates from the character of the soil, and its locality, the gross annual produce from which he deducts the working expenses, seeds, manures, feeding-stuffs, depreciation of stock, dead and alive, interest on his capital. The balance should be the landlord's rent, though, and unfortunately, from excessive competition, he has frequently to give much more. There is one class of property on which we have no decisive case, that of mansion houses in the country. Locality has much to do with their value, and it is difficult to lay down any general rule; but as they are not built for profit, and are seldom let, probably 3 per cent. on the value of the house, gardens, and pleasure-grounds would be a fair rateable value. Woodlands are seldom let, nor is there a regular annual return

from them, therefore the simplest way of assessing them would be at the agricultural value of the land planted, with a reasonable per-centage on the cost of planting.

II. THE AREA OF ASSESSMENT.—It is now almost universally admitted that the area of rating should be co-extensive with the area of management, and the equity of this is so manifest that it is needless to enter into any argument in support of it. It was feared by some that one effect of the Union Chargeability Act would be to cause less attention on the part of the guardians, when the charge fell on the union, and not on the separate townships. This has not been the case; the attention to the administration of the poor funds is quite as close now as it was before the passing of that Act. The benefits that would arise from the application of the same principle to the highways, would be even greater than in the case of the Poor Law Unions. The districts should be uniform with the unions, and the roads maintained by a district rate, if they are to be maintained out of local rates at all. The Under-Secretary for the Home Department stated last session, in the House of Commons, that the management by parishes was a thing of the past, and certainly the rating by parishes ought to be so, and until the highway, turnpike, township, and *ratione tenura* are all thrown under one management, and paid, if paid from the local rates at all, by a district rate, good roads will not be had.

III. THE PARTIES FROM WHOM THE RATES SHOULD BE LEVIED.—That a large portion of the rates ultimately fall upon the owner is undoubtedly true, but 1st, how often by alteration in local circumstances causing a rapid and unforeseen increase in the expenditure, as well as by alterations in the law, are occupiers holding under lease saddled with a large increase of their rates? By the Acts 24 and 25 Vic., cap. 55, and 28 and 29 Vic., cap. 79, the occupiers, in many cases, had their rates increased by 4, 5, and even 6 times their former amount. To those who are thus, for 10 or 15 years, saddled with an increase which they could not foresee when they took their farms, there is no redress, and they must go on paying till the end of their lease; and even those holding from year to year, not unfrequently go on paying the increase rather than run the risk of being thrown out of their farms by seeking a readjustment of their rents, whereas, if each party paid the amount which is fairly exigible from them, the hardships would be removed. The average incidence of the rates is stated by Mr. D. Baxter to be “three-fourths upon the owner and one-fourth upon the occupier of lands, and one-half on the owner and one-half on the occupier of houses.” He further insists that it is much better that the proportion which each *actually* pays should be charged to him direct. The select committee of the House of Commons, 1870, also report “that it is expedient to make owners as well as occupiers directly liable for a certain portion of the rates.” For *what* portion they do not state. The portions paid in England, Ireland, and Scotland are as follows, viz., in England the portion paid by the owners is nothing—by the occupiers all; in Scotland the owner pays all the county rate, and they and the occupiers pay equally to the poor and highways; in Ireland the occupiers pay county and road rates, and they and the owners divide the poor-rates, so that an occupation, say of £1,000 per annum, a rate of 2s. 6d. in the pound would be thus—

	Owner.	Occupier.
In England.....	Nil	£125
In Scotland.....	£75	£50
In Ireland	£31 5s.	£93 15s.

So that in no case have we exactly the proportions which Mr. Baxter states to be the average incidence of the rates in the United Kingdom, though Scotland approaches nearest to it. I do not, however, propose to saddle the owners with the Scotch amount, but with one-half of all the local taxes, leaving the other moiety to be paid by the occupiers. This, I believe, will be the proportion recommended by the committee, if again appointed.

2nd. A large portion of the rates amounting for the year ending Michaelmas, 1869, to £2,417,391 18s. 10d. is expended by the magistrates, who at present contribute directly (except as ratepayers) no parts of the funds they administer, are wholly irresponsible, are not even bound to submit their accounts to an official auditor, and render no account of their intrusions to those who supply the funds. To obviate in some measure the hardships experienced under the first head, and to

give the magistrates a more direct interest in the funds they administer, I trust the recommendation of the Commons' committee, to make owners as well as occupiers liable for the rates, will ere long receive the sanction of the legislature, so that the burden of any increase in the rates may not fall so heavily on the occupiers.

IV.—THE PARTIES FRAMING THE ASSESSMENT, AND MAKING, ALLOWING, AND COLLECTING THE RATES.—1st. *The framing the Assessments.*—The valuation lists, upon the basis of which the poor rates are levied, are made by the overseers of each township, and are revised and allowed by the assessment committees. These lists form the basis of assessment both for the poor rates and also for most of the local rates. The amount called for by the county finance committee is charged upon the various townships according to a basis of assessment framed by the county rate committee. This committee has not the means of making a uniform assessment. It may (A) call before it the overseers with their assessments, and frame from them a county rate basis, as the committee of this county did in 1862, and took a large amount of trouble in the matter, going from union to union and making inquiries of the various overseers; but they could have no check on the lists and no assurance that the assessment in each township was correct. Any one who has been a member of an assessment committee knows the difficulty of obtaining correct information from the majority of the overseers, and of attaining uniformity even within the union where the townships are generally known to some members of the committee—how much more difficulty when the whole country is to be gone over! or (B) it may take the total amounts of the valuation lists as approved by the various union assessment committees, and frame the basis on these as was proposed in this county in 1865, when it was proved, by unions appealing against the proposal, that the utmost disparity existed between the unions in the manner of framing the valuation lists, and that the proposal would involve an overcharge on some of the unions of 10 to 12 per cent.; or (C) the county rate committee may call for copies of all the lists *in extenso*, and go over them, and alter the lists according to the best information it can obtain, calling in professional aid where it sees fit. In this manner the county rate basis now in force in this county was framed, and is, perhaps, on the whole as satisfactory as the committee has it in its power to make. The county rate committee of Durham have, I believe, employed a professional valuer and carefully gone over each township, raising the county assessment from £1,529,829 in 1862 to £3,385,700 in 1868. This county has been raised from £1,270,051 to £1,394,280. The establishment of union assessment committees, though throwing a large amount of disagreeable and thankless work upon a few of the guardians, was a great step towards obtaining uniformity of assessment. It has to a large extent done this in each union, and has also been a means of bringing under assessment a large amount of property which had previously been omitted, or but partially assessed. The rateable value of Hexham Union, for instance, has been raised from £163,600 to over £200,000. That of Tynemouth from £246,522 to £307,908. That of Chester-le-Street from £78,591 to £151,000, and others in a like manner. So far as the maintenance of the poor is concerned, the working of the assessment committees has been most satisfactory, but where the highway districts are not coterminous with the poor law unions (as is the case in Northumberland), there is no machinery by which the assessment in the portions of the different unions forming the district may be equalized. The work, too, of the assessment committees is greatly increased by the fact that the overseers (who may be, and sometimes are females), are generally changed every year, and as not unfrequently the ratepayers best fitted for the office manage to shirk the disagreeable duty, they require all the time they are in office to learn its duties. Any one who has been obliged month after month to sit on an assessment committee, striving to get at the truth regarding the overseers' valuation lists, and having the same process to go through year after year, must long ago be convinced of the need of a complete change. It is not at all surprising that overseers holding office but for a year should be ignorant of the law regarding rating, when we consider that to become acquainted with these laws he must make himself master not only of numerous acts of parliament, but with the still more numerous decisions of the superior courts—decisions which are not always consistent one

with another. Machinery, for instance, for nearly a century was held by the courts to be rateable whether affixed to the freehold or merely attached, or whether it was real or personal property, or whether it would go to the heir or the executor, when in 1868 the Court of Queen's Bench in *R. v. The Overseers of Halstead*, held that looms and lathes were mere chattels and not rateable. Again, in reference to tithe, it used to be rated on its full amount, when in the case of *R. v. Goodchild and others*, certain deductions were ordered to be made, and, among others, curate's salary; but in a recent case (*R. v. Sherford*, 31 L. P., 436) it is held that curate's salary is not to be deducted, Mellor J. saying, "The fallacy of the assessment consists in confounding the rateable value to the poor with the remunerative value to the incumbent." It is, therefore, as I have said, not surprising that overseers are not acquainted with the law they have to put in force. The remedy for this want of uniformity appears to be

(1) To abolish the office of overseer and appoint in his place a paid officer for each union, who may be called the "rate officer." His duties would be (A) to frame the valuation lists, duly published, and bring them before the assessment committees, with all the information requisite for them to know in reference to the list, and to appear in appeals to the Assessment Committee, and in appeals from it to the county assessment Board, to be after referred to, (B) to make the rates as pointed out, and (C) to collect the rates.

(2) By continuing the Assessment Committees with additional powers, as to having valuations made, employing the county valuer, and examining witnesses on oath.

(3) By the establishment of County Assessment Boards, with power to hear and dispose of all appeals from Union Assessment Committees, or individual ratepayers. An assessor (who might with advantage act also as stipendiary magistrate), should sit with the Board to guide it in questions of law, and on disputed points to grant cases to the Court of Queen's Bench, but in all questions of fact, the decision of the Board to be final.

(4) By the appointment of county valuers who would act as clerks to the County Boards, have a fixed salary, and devote their whole time to the work of the Board and Assessment Committee.

2nd. *The making, allowing, and collecting the rates.*—At present the Poor-rate is made by the overseers, allowed by the magistrates, and collected by the overseers, or in some cases by a paid collector, who may be, and generally is, a different party in each township employing such an officer. From this rate, as we have already said, are paid the county and police rates. Where the Highway Act is not in force, or when the highway township does not correspond with the poor-law township, the township surveyor makes a separate Highway Rate. Then in towns we have general district rate, lighting, and watching rates, water rates, &c., &c., all causing confusion and employing a number of officers where one would suffice. The simple remedy for this incongruous state of matters seems to be to give the Board of Guardians, or the Assessment Committee, acting as the Finance Committee, or Board of the Union, the power of making and levying all rates required for local purposes. Let all the Boards at present empowered to collect local rates send to the union finance board, on or before a fixed date, a statement of all the monies they require for the following year. These amounts being all before the board it would instruct its rate officer to make a rate on the basis of the approved valuation lists, for the various amounts required; the rate should show opposite the name of each ratepayer the amount he has to pay to each separate object—not lumping the whole under one general head, as is now the case. When the rate is made and approved by the finance board of the union, the rate officer should immediately send a demand note by post to each ratepayer, showing the amount on which he is assessed, and the sums he has to pay on account of each separate fund, and naming the days on or before which each instalment of the rate must be paid, and he, as he received the rates, would pay the amounts to the treasurers of the different funds. This abolition of the office of overseer, the appointment of a paid officer, and the consolidation of the rates, I have long advocated; and I am glad to find the Select Committee on Rates (1870) reporting (sec. 5 and 6), "that the great variety of rates levied by different authorities, even in the same area on different assessments with different deductions, and by different

collectors, has produced great confusion and expense; and that, in any change of the law as regards local taxation, uniformity and simplicity of assessment and collection, as well as of economy of management, ought to be secured as far as possible. That the consolidation into one rate of all the local rates collected within the same area is a matter of great importance; and your Committee concur in the resolution of the Select Committee on Poor Rates' Assessment (1868), which recommended one consolidated rate, viz., 'that a demand note should be left with each ratepayer on the rate being made, stating the amount of the requisitions, the rate in the pound for each purpose, and the period for which the rate is made, the rateable value of the premises, the amount of the rate thereon, and of each payment of the instalments of the rates.' Some have proposed that the property and income-tax and house duty should be collected by the same officer, and at the same time; but the policy of mixing up local and national taxes is, I think, very questionable, as is that of leaving the collection of national taxes in the hands of the parish collectors, who are now employed. There can, however, be but one opinion as to the desirability of having the collection of all local rates under charge of one board, and made by one officer.

V. THE PARTIES ADMINISTERING THE RATES.—It is a well established axiom in England that those who provide the funds should have a voice in their disbursement. Let us see how this is carried out as regards the local rates. At present the administration is managed by several distinct bodies. 1st, The board of guardians controlling the expenditure for the poor; 2nd, The highway board (where the Highway Act is adopted) controlling the expenditure for roads; 3rd, The town councils and local boards controlling the rates specially applicable to the towns; and 4th, The magistrates controlling the expenditure of the county and police rates. There are in some localities other bodies—such as sewer authorities, river and harbour commissioners, water authorities, &c., &c.; but these are exceptional and not general as the others are. The bodies included under the first three heads are elected by the ratepayers, with the addition, in the two first named, of the resident magistrates as *ex-officio* members of both boards. In the choice of the fourth body the ratepayers have no voice, and over its expenditure, amounting in 1869, as we have seen, to nearly two and a-half millions, they have no control. The guardians, highway boards, and local boards and town councils are bound to have their accounts regularly audited by an official auditor, independent alike of ratepayers and boards, and to publish the result of the audit. There is no law enforcing an audit of the county accounts by an official auditor. In some counties this is done, but in many counties the audit is made by the finance committee, the very parties entrusted with the expenditure. The cry which has arisen for county financial boards has been caused, I believe, not so much from the idea that there has been mismanagement on the part of the magistrates, as because they give no account of their intromission with the funds contributed by others, nor is it at all surprising that such a cry has arisen, when we find the county expenditure risen to the large sum of nearly two and a-half millions, but it is surprising that for their own exoneration the magistrates do not, in every county, put an end to the necessarily perfunctory audit of the Finance Committee, and submit their accounts to an independent auditor. I do not expect that County Financial Boards will effect any greater economy than is now exercised in the County Expenditure, and would gladly leave it in the hands of the magistrates with an official audit, and publication of accounts; but if the cost of the prosecution of felons, and of the police force, with the maintenance of pauper lunatics, and the other items I have mentioned as being fairly chargeable to the Consolidated Fund, are to remain in charge on the local rates, I do not see upon what ground the demand of the ratepayers to have a voice in the management can be refused. The Select Committee of 1870 admits the principle, when it recommends (Sec. 3 and 4) that if owners are to pay a portion of the rates, they should have a direct voice in the management. If, however, these various items of expenditure come, as I think I have shown they ought, from the Consolidated Fund, then the Government would act wisely in continuing the management in the hands of the magistrates who have the time and local knowledge requisite for an efficient performance of the work; but if on the other hand these charges are to continue to come from the local rates, then the burden ought to be divided be-

tween owners and occupiers in the proportions I have before stated, and the administration entrusted to Boards fairly representing both parties. In conclusion, let me urge that we have no more legislative patchwork; let us have the whole question of local taxation fully investigated, and the result consolidated in one act, the first clause of which should make a clean sweep of the puzzle and confusion now existing in consequence of the multitude of acts and decisions on which the law of rating now rests.

The CHAIRMAN said that those who followed closely the reading of Mr. Dods' Paper would find it difficult to rise and criticise what was stated in it; it was so elaborate that it would almost require them to read it over if they wanted to thoroughly discuss it. They had already partly discussed the subject to which he himself had given a great deal of consideration, and gone into more or less all the topics which Mr. Dods had touched upon. In almost all the conclusions Mr. Dods had come to with regard to local taxation, he pretty fully agreed. There was nothing worse than the patchwork which they had had with regard to local taxation, and he hoped that Parliament would soon take up the subject, and that they would get more uniformity in the collection of rates, in the administration of funds, and the assessment of property. The more the subject was discussed by Clubs and Chambers of Agriculture, the more it would be pressed upon the attention of Parliament, and Parliament was more ready to take up a subject that was continually dinned into the ears of Ministers than from purely philanthropic motives.

Mr. JOSEPH LEE (Dilston) proposed a vote of thanks to Mr. Dods. He differed from Mr. Dods in one respect, and that was as to how the ability of a parish should be rated for the relief of the poor. He was in favour of landlords paying a third of the poor rates, the occupier another third, and the remaining third to come from the Imperial Exchequer. As to pauper lunatics Mr. Dods proposed that they should be paid for by Government, but if that was adopted he was afraid there would be a tendency in Unions to send persons to a lunatic asylum who ought not to go there, and who at present were kept in the workhouses.

Mr. M. SMITH spoke of the additional burden which was thrown upon many tenant-farmers when the Bill for Union Rating came into operation. He held that every source from which income was derived should contribute towards the maintenance of the poor. He seconded the vote of thanks to Mr. Dods for his very able and sensible paper.

The motion was carried with acclamation.

At the adjourned meeting held on Tuesday, Jan. 31, Mr. C. C. Grey in the chair, the paper on Local Taxation, as read by Mr. T. P. Dods, again came under consideration, and Mr. Joseph Lee moved, "That the support of the poor is a national duty and should be paid out of a national rate on personal as well as real property; but in consideration of having local management it is expedient that two-thirds should be paid from local rates and the other portion from the Imperial Exchequer." Mr. J. B. Lee seconded the proposition. The Chairman thought a general resolution, to be drawn up by a small committee, embodying the views of the Club, and recommending the whole subject, as set forth in Mr. Dods' paper, would be preferable to passing a resolution like Mr. Lee's, which only touched one part of the subject. Mr. Lee agreed to withdraw his motion, and it was also thought that if the Club could bring its influence to bear upon those gentlemen who are likely to sit upon the Committee of the House of Commons, it would be better than sending up petitions; and therefore copies of Mr. Dods' paper will be sent to those gentlemen, and to others who are taking an interest in this question.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

At the general meeting held in the Society's Hall, Edinburgh, the Marquis of Tweeddale, President of the Society, in the chair, The office-bearers for 1871 were appointed.

The Secretary read a list of sixty proposed new members, all of whom were duly elected.

Sir WILLIAM GIBSON-CRAIG read minutes of meetings of the committee, from which it appeared that the committee had resolved to recommend to the directors the propriety of extending the annual benefits of the Society to such amount of income as the directors find prudent, and to suspend in the meantime, so far as competent, any addition to the capital. It was also recommended that a committee should be appointed to take into consideration the chemical department of the Society, with the view to afford the benefit of chemical investigations to the agriculturists all over the country. Another recommendation was that the travelling expenses of directors resident at distances should be paid; also that fees be paid to examiners. It was moved in committee by Sir Wm. Gibson-Craig, Bart., and seconded by Mr. Dickson, that the committee recommend the directors to increase the Secretary's salary by £150 per annum.

An amendment was proposed by Mr. Melvin, and seconded by Mr. Hope, that it is at present inexpedient to make any increase to the salary of the Secretary. The motion was carried by 12 to 4. The Board had appointed a committee to consider the chemical department, and to report. A committee was appointed also by the Board to consider how the recommendation regarding the travelling expenses of directors could be best carried out.

On the motion of Captain Maitland Dougall, it was unanimously resolved to increase Mr. Menzies' salary by £150 per annum.

The meeting approved of the report.

The accounts of the Society were then submitted by Sir William Gibson-Craig, Bart. The income from all sources amounted to £8,808 17s. 1d., and after deducting expenditure there remained a balance in the Royal Bank of Scotland at 30th of November last of £1,808 7s. 7d. The accounts were approved of.

Mr. MURRAY (Dollerie) stated that the directors at their meeting on the 2nd November had, on the suggestion of Mr. Dundas, of Arniston, remitted to the Finance Committee to reconsider the proposed alteration on Bye-law No. 2, which it would be in the recollection of the meeting had been referred back to the directors by the general meeting in June, and that Mr. Dickson, of Corstorphine, Mr. Dundas, of Arniston, and Mr. Mylne, Niddrie Mains, had been added to the Finance Committee specially for the purpose of considering the subject. The existing bye-law is in the following terms: "That tenant farmers, secretaries and treasurers of local agricultural associations, factors, and proprietors farming the whole of their own lands, whose assessment in the valuation roll does not exceed £500, shall pay at admission, and afterwards annually, in advance, the sum of ten shillings, with the option and power of redeeming the same by payment of five guineas, as the purchase of a life subscription, and which life subscription may be so purchased, under deduction of any annual payments that the member may have previously made, with this limitation, that at no time shall a member have the power of redeeming the annual payments for a less sum than £3." The committee met on the 23rd of November, when after mature deliberation, it was unanimously resolved to recommend that the bye-law should be amended as follows: "That proprietors farming the whole of their own lands, whose assessment on the valuation roll does not exceed £500 per annum, and all tenant farmers, office bearers of local agricultural associations, resident agricultural factors, land stewards, foresters, agricultural implement makers, and veterinary surgeons, none of them being also being owners of land to an extent exceeding £500 per annum, shall pay at admission and afterwards annually, in advance, the sum of ten shillings, with the option and power of redeeming the same by payment of five guineas, as the purchase of a life subscription, and which life subscription may be so

purchased under deduction of any annual payments that the member may have previously made, with this limitation, that at no time shall a member have the power of redeeming the annual payments for a less sum than £3." The report by the committee having been, in terms of the charter, brought before the directors on the 7th of December and the 4th of January, was unanimously approved, and directed to be submitted to the general meeting in January for approval, and ordered to be submitted to this meeting. He moved that the alteration be approved of.

Mr. DUNDAS (Arniston) having seconded the motion, it was passed.

Mr. KINLOCH, Jun., of Gilmerton, said it would be very gratifying to learn that the late show at Dumfries in July last had been, in a financial view at least, a very great success. He was informed that this was the first, except those held at Edinburgh and Glasgow, that had paid its own expenses. A suggestion had been made to extend the show. However that might suit exhibitors of machines, it was held that it would not be satisfactory to the owners of stock or those connected with the management, or the public themselves, for on the last day of the show the amount received at the doors fell off considerably. In fact, two sixpenny days were found to be too much. At the forthcoming show at Perth, to be held on the 26th, 27th, and 28th July, it was proposed to revert to the three days' arrangement—the judging to commence on the morning early, the public to be admitted for 2s. 6d. on the Wednesday afternoon; Thursday, at 1s.; and Friday, 6d. There was an alteration in regard to Rule 13, which dealt with a point of considerable interest, namely, the veterinary examination of horses. Last year they acted upon what was not an unreasonable idea. The directors made a rule by which horses selected for prizes were to be passed by a veterinary surgeon before being awarded prizes or certificates of merit. The directors would not in future receive any protest on the ground of unsoundness, as they would not allow themselves to be put in the position in which they were placed the year before last. At that time an objection was taken to the prize horse on the ground of unsoundness; and after the horse was examined the prize was given to the second animal. It afterwards eked out that the second animal was as bad in this respect as the first animal. In consequence of no protest being lodged in time against the second horse, an inferior animal carried off the prize. He had only further to intimate that a requisition had been received from the counties of Berwick, Roxburgh, and Selkirk, praying them to hold the show of 1872 at Kelso. The directors approved of this request, and it was for the meeting to confirm their approval, if it thought fit.

The meeting passed the resolutions, and agreed that the show of 1872 should be held at Kelso.

Mr. MUNRO (Fairnington) moved, "That a class of implements for competitive trial be annually fixed on, the implements to be exhibited at the show, and the trial to be held at a time of year best suited for testing the strength of the implements and the work performed. That the trial be extended over a longer time than has hitherto been the practice, and that it be remitted to the directors to make arrangements with the manufacturers as to the manner in which the trials may be most satisfactorily carried out."

Mr. ORD (Muirhouselaw) seconded the motion.

Mr. KINLOCH, Jun. (Gilmerton) suggested that the whole matter should be remitted back to the directors.

This was agreed to.

Mr. CAMPBELL SWINTON (Kimmerghame) reported that during the past year the Society's premium and medals had been in operation in 260 different localities. The money premiums awarded amounted to £292 10s., besides four medium gold, ten silver, 199 medium silver, 44 minor silver, and 164 plough medals. For 1871 the directors suggested for the approval of this meeting the following grants: Eight districts for cattle premiums, at the same rate as last year, viz., £17 and four silver medals each, besides a special grant of £20 for

three alternate years, to the Island of Unst; three districts for stallion premiums of £25 each, and two for mares at £7 and a silver medal each; five districts for sheep at £16 and five silver medals each. The premiums for cattle and sheep were given to each district for three alternate years, and the directors had this year suggested that a certain number of medals should be given in the intermediate years. Formerly only one was given, but it was now proposed to allow four for cattle and five for sheep; one district for swine, at £7, and three silver medals; two districts for dairy produce, at £8 and four silver medals, besides the usual medals to be competed for at Kilmarnock; seventy districts, for 218 medium silver medals, for green crops; best-managed farms; best male and female animals, seeds, &c. It was also proposed that the offer of the plough medal should be continued under the usual conditions. The directors further had to propose that the grant of £50 to the Edinburgh Christmas Club be given in 1871.

Mr. MAXWELL INGLIS, (Loganbank), reported that in 1870 competition for the Society's money premiums and medals took place in twenty-two parishes, when £30 and forty-one medals were awarded. The directors suggested, for the sanction of the general meeting, the following scheme for 1871, viz.: Twenty-one parishes for cottages and gardens at £3 and four silver medals each; twenty districts where the money premiums are given by the proprietors for forty medals—two to each district; the gold medal to the proprietor in Scotland who shall report the improvement of the greatest number of cottages in 1868, 1869, and 1870; the gold medal to the proprietor in Scotland who shall report the erection of the greatest number of approved cottages; the gold medal to the proprietor in Scotland who shall have erected on his estate the most approved farm buildings in reference to the proper accommodation of farm-servants. The rules of competition for the several prizes are contained in the general list of premiums for the current year, and copies may be had on application to the secretary after the 14th of February. He regretted that there was not sufficient interest taken in the condition of agricultural labourers' cottages. He thought that the attention of landed proprietors might with advantage be more devoted to the subject.

Dr. ANDERSON reported that during the past half year the business of the Chemical Department has been conducted without intermission, and analyses of the usual character have been made for members of the Society, including those of almost every variety of manures, feeding stuffs, waters, &c.; and though the number of these analyses has scarcely been equal to that of last year, it is quite up to the average of previous years. The great majority of those analyses present no features of sufficient interest to induce me to occupy the time of a general meeting, but some facts worthy of notice have been observed. There have been fewer analyses of Peruvian guano than usual, but the inferiority in quality which I have referred to on previous occasions has continued, if not increased. As a general rule the samples have contained a very considerably larger quantity of sand than formerly, and 5 or 6, and in more cases 10 or 11 per cent. of that substance had been observed, while at the same time the ammonia has not unfrequently fallen short of 15 per cent. or more than 2 per cent. below what two years ago was considered to be the average of genuine Peruvian. It is to be noted that the value of Peruvian guano has fallen to the extent of from £1 5s. to £1 10s. per ton, while its price, so far from diminishing, has increased. These facts merit the attention of the farmer, and should lead to increased economy in the use of this manure. An increase indeed has taken place in the price of all manurial matters, which should induce an increased amount of attention to economy of the manure heap. As regards feeding stuffs my report must on the whole be rather favourable than otherwise. The amount of adulteration has been rather smaller than usual, and although some samples of very inferior articles have been analysed, I believe that if proper care and precaution be taken there is no very great difficulty in procuring a genuine article. During the past season, the rotation field experiments have been continued, and next year will be completed, when it is hoped the results will be found to be of interest and importance, though the seasons have not been on the whole very favourable to bringing out the full effects of artificial manures. Although I have found it necessary, acting on the advice of my medical attendant, to ask the directors to extend my leave of absence, I have done all in my power to superintend

the work of the laboratory, and my health is now so far re-established that I expect shortly to return to my work; and I cannot conclude without expressing my best thanks for the kind consideration I have received during my long illness—a consideration which I believe has had no little effect in promoting my convalescence.

(Signed)

THOMAS ANDERSON.

16th January, 1871.

Mr. GILLON (Wellhouse) stated that the question of opening up the veterinary examinations had again been before the committee, and they had agreed that the examinations should be opened up. He also read the report on horse-shoeing. He had had all his horses shod for the last six months on the Charlier system, and in all his experience he never had his horses more satisfactorily shod. Horses, instead of getting "groggy" as they grew older, got better.

A list of premiums awarded in 1870 for essays and reports was presented.

The Marquis OF TWEEDDALE stated that it would be in the recollection of those present that the Society, at its general meeting on the 19th of January, 1870, had resolved to renew the Special Committee on steam cultivation; that the question of double-furrow ploughs drawn by Thomson's india-rubber tire-wheeled engines should be considered, and that the committee should also take into consideration generally the subject of cultivation by steam. The resolution then adopted was brought before the Board of Directors on the 2nd of February, 1870, when it was resolved to leave the details to be carried out by the Special Committee, no limit in regard to time being required. The subject was again before the directors on the 7th of December, when the Secretary stated that no meeting of the committee had been called, in consequence of his being unable to arrange a trial of ploughs drawn by Mr. Thomson's india-rubber tire-wheeled engine. It had been the intention of the committee to inspect Lord Dunmore's plough, drawn by Mr. Thomson's engine last spring; but owing to unfortunate circumstances, it was impossible to make the inspection. It had again been attempted in autumn to have the inspection; but owing to Lord Dunmore's accident, and a break-down of his plough, it had not taken place. It is understood that now all is ready; and as soon as the weather will permit, an inspection will be arranged. Lord Dunmore was present, and he would perhaps give the result of his experience.

Lord DUNMORE said that he had not the slightest idea that he should be asked for any statement at all about what he had been trying to do; but he would be happy to give them, as far as he recollected, the result of the experience he had had of steam-cultivation. As far back as February of last year he commenced work with a six-horse power engine and a four-furrow plough, and he came to the conclusion that such an engine was not sufficiently powerful to draw a four-furrow plough through stiff clay land. Within the last summer he had built a new engine of eight-horse power. The first one was on a different principle from those of Mr. Thomson's. His original was a horizontal engine. The first he (Lord Dunmore) had was a vertical, and he found that it answered better for the work, and that it could be worked by only a man and a boy, instead of two skilled men. The new engine he had built in summer was much more powerful than his former one. He began work by reaping the harvest by steam, and he found that the wheels, which he had made much broader—21 inches of india-rubber, instead of 11 or 12—made hardly a perceptible impression on the stubble. He began ploughing with a single three-furrow plough, and they made very good work, so much so that Mr. Head, of Messrs. Ransomes and Sims, who had come to inspect the working with a poor opinion of what could be done, expressed himself highly satisfied, and took the first train to Edinburgh to take a license from Mr. Thomson to make the engines. He thought the thing was in its infancy; but he believed that they would be able through time to produce something that would work well. In the first week in October he ploughed upon stubble with the three-furrow plough. Although they were new at the work, they did half-an-acre in forty-eight minutes. They broke several things, and took more than forty-eight minutes to another half-acre; but he believed in time they would be able to do an acre in an hour—he should think at an expense under 5s. Ever since that trial which

they had, and which was quite private, they had had draughtsmen down from all the large firms in England to copy the engine. They were all going to adopt the vertical engine and broad wheels. He had been trying to discover an expedient to avoid the turning of the plough and engine, which had been found inconvenient in short rigs, and he thought he had succeeded. He had got Mr. Gray, of Uddingstone, to make a vertical engine, which he thought would succeed.

A vote of thanks was passed to the Chairman.

A monthly meeting of the directors of this Society was held on February 1, in Edinburgh, Sir James Gardiner Baird, of Saughton Hall, Bart., in the Chair.

A letter from Mr. William Fiskien, Stamfordham, Newcastle-on-Tyne, suggesting that the special committee on steam cultivation should inspect the Fiskien steam cultivation tackle was referred to that committee.

The following special committee was appointed to consider and report on the system of engaging farm-servants, with reference to the propriety of recommending the adoption of registers throughout the country: Sir William Stirling-Maxwell, of Polloc, Bart.; Mr. Vans Agnew, of Barnbarroch; Mr. Currer, The Lee; Mr. Dickson, of Corstorphine; Mr. Elliot, Laighwood; Mr. Hog, of Newliston; Mr. Irvine, of Drum; Mr. Mitchell, Alloa; Mr. Mylne, Niddrie Mains; Mr. Russell Pilmuir—Mr. Irvine to be convener.

The remit from the general meeting in regard to the motion by Mr. Munro, Fairnington, that a class of implements for competitive trial be annually fixed on, was referred to the Committee on General Shows and the Machinery Committee.

The minute of the special Finance Committee recommending—1st, that the directors should authorise the Secretary to pay the railway return fare of all such directors as may claim it for the days they have attended the meetings of the Society. 2nd, that the fees to examiners in agricultural education and forestry should be 2 guineas per day to each examiner, in addition to travelling expenses, was again before the board, when it was resolved to approve of the fees to examiners being paid as recommended by the Committee, and to resume consideration of the travelling expenses of directors at the next board meeting.

The committees for the current year were arranged.

The SECRETARY read the following proposal by the President to form a committee on the general improvement of land in Scotland: "In consequence of being so often asked, I have brought this subject before the directors. I have for many years thought that the improvement in breeding cattle, sheep, pigs, &c., had reached its climax of perfection; and though I would not desire to see our prizes for stock discontinued, it appears to me that there is a question of greater importance to the public which should occupy the attention of the Highland Society—viz., the improvement of the cultivation of land, so as to increase the produce of human as well as of animal food. I make this proposition, as I believe from experience that the land of second and third quality is capable of a very great improvement, at a much less expense than farmers imagine, were they possessed of the means applied by the most experienced in carrying out successfully the contemplated improvement. It is in the hopes of accomplishing this object that I am induced to propose to the board to form a committee in order to report how they would recommend it to be accomplished." The proposal being approved of, the following gentlemen were appointed: The Marquis of Tweeddale; Mr. Dickson, of Corstorphine; Mr. Smith, Whittingham; Mr. Swinton, Holyn Bank; Mr. Young, Keir Mains; Mr. Elliot, Laighwood; Mr. Stephens, Redbrae; Mr. Mitchell, Alloa; Mr. Hunter, of Thurston—the Marquis of Tweeddale convener.

Mr. F. N. MENZIES called the attention of the board to the French Peasant-Farmers' Seed Fund, the consideration of which had been postponed at the meeting of directors held on the 4th January.

Mr. GRAHAM BINNY stated that as there appeared to have been some misapprehension as to the steps taken by the board in this matter, and as he, as senior director present, had been chairman at the meeting on the 4th January, he thought he should explain to those of the directors who were not present

at that meeting that the matter had simply been postponed. The directors had not decided on any course of action; but had only put off the consideration of the subject till now. After a lengthened discussion, chiefly as to whether the Society could, under the powers of its charter, vote its funds for such an object, it was ultimately decided that it could not.

A proposal to form a committee to raise subscriptions was considered, but was not adopted, as the board was of opinion that the committee already formed was sufficient, and that another committee would not, perhaps, be of advantage. It was ultimately resolved that the board express a deep interest in the success of the movement, and their hope that as it was not in the power of the Society to devote its funds to subscriptions of the kind, the members of the Society would do their best to assist in promoting so laudable a fund; and that the Secretary be instructed to send a circular to the secretaries of all agricultural associations who are receiving aid from this Society to request that they will call the favourable attention of their members to the movement.

The following letter from Dr. Anderson, addressed to the secretary, was read:

London, 16th January, 1871.

My dear Sir,—The letter from Mr. Melvin, which was read at the meeting of directors of 4th January, calls for some observations from me, as he has in certain respects greatly misunderstood my meaning, and in others shows an imperfect knowledge of the nature and extent of the work done in the laboratory. He says that little has come of the attempts which have been made to utilise refuse matters as manures. But it seems to me that, if fairly considered, results of much importance have been obtained. A great number of refuse matters have been examined, their real value ascertained, and some of them are actually now employed with advantage as manures. Much more frequently, however, it has happened that refuse matters have been brought to me with the statement that, having been used by some farmers in the neighbourhood of the works where they are produced, they have been found to give results equal to or better than those obtained from the best Peruvian guano; while analysis has shown that where the cost of carriage and expense of application were taken into account they could not be used with any prospect of success, except in the most special and exceptional circumstances, and could not be made to replace the ordinary artificial manures as had been alleged. I need scarcely say that such conclusions, though less gratifying, are not less important to agriculture, and prevent the serious losses which ignorance too often entails. The fact is that the utilisation of refuse matters is not a field in which a great deal can be done, for the valuable constituents of manures are so useful for other purposes that they are seldom allowed to go to waste when it is possible to economise them; and the negative results too often obtained in such inquiries are due to the prevalent impression that what is of no value for other purposes must be of great value as a manure. As regards the utilisation of the ammonia from shale works, my attention has been directed to that subject. The mode of economising and converting it into a marketable commodity is perfectly well known to all manufacturers who understand their business, and in most of those with which I am acquainted it is regularly worked up and brought to market, but I know that in some of them the quantity is so inconsiderable that the manufacture cannot be carried on with profit; and in regard to this point it must be observed that the profit which can be obtained depends not merely on the quantity of the substance, but to a great extent on the proportion of worthless matters with which it is intermixed, by which the cost of obtaining it in a marketable state becomes so high as to exceed the value of the material obtained. As a remarkable illustration of this point, though bearing upon a totally different subject, I may state that the sands of the River Rhine are known to contain gold amounting in value to many millions sterling; but none is extracted from it, because the cost exceeds the value of the gold obtained. Mr. Melvin refers also to the refuse obtained in the manufacture of oatmeal, but does not seem to be aware that all the different kinds of mill refuse were examined in the laboratory some years ago, and full details of their composition and value were published; and I think I am fairly entitled to claim as the result of the labours of the chemical department, the fact that the refuse formerly burnt now fetches, according to Mr. Melvin's own statement, a few shillings per ton, which

is certainly the full value of the article at the present prices of manures. Mr. Melvin seems to think that it is employed for the adulteration of manures, and resold to the farmers at a price above its value; but I do not think this is possible, for the cost of manipulating it in such a manner as to conceal its

texture would be considerable; and even if it be, I do not see that any one is to blame except the farmer if he purchases an article without having assured himself of its real value.

I am, dear sir, yours truly,
F. N. Menzies, Esq.

THOMAS ANDERSON.

THE SMITHFIELD CLUB.

A Council meeting was held on the 31st January. Present: Mr. Torr, trustee, in the chair, and afterwards Lord Tredegar, vice-president; T. C. Booth, J. Beasley, J. N. Beasley, C. C. Bigge, W. B. Canning, W. Farthing, Brandreth Gibbs (hon. sec.), J. Giblett, R. Hornsby, C. Howard, R. Leeds, E. W. Moore, R. J. Newton, W. Bigden, T. L. Senior, C. Stephenson, J. Wilson.

Professor Simonds' report on foot-and-mouth disease at the late show was read.

The subject of the detention of animals that may occur at future Shows was referred to the Stewards to investigate and consider and report to the next Council.

The Hon. Sec. reported the deaths since the last Council meeting of Lord Walsingham and the Earl of Aylesford, vice-presidents of the Club.

It was resolved: That the thanks of the Council be accorded to the Right Hon. Lord Penrhyn, president elect, for his handsome donation of £100 to the funds of the Club, and also the regret of the Council that his lordship is unable to accept the presidency of the Club for the year 1872.

Mr. E. W. Moore of Colehill, Highworth, and Mr. Jacob Wilson, of Woodhorn Manor, Morpeth, were elected stewards of live stock for the ensuing three years.

Mr. Joseph Druce and Mr. Robert Leeds were re-elected stewards of implements.

The prize-sheet for the next Show was revised.

In the Scotch polled division the ages of heifers in class 20 is in future to be not exceeding four years, and a new class established for cows above four years old (that must have had at least one live calf), with one prize of £15, and a silver medal to the breeder.

In the Irish division the second prize in each class to be discontinued, and after the words "Irish breeds of cattle," to be added, "not being Devons, Herefords, Shorthorns, Sussex, Norfolk, Longhorn, Scotch, or Welsh breeds."

It was resolved: That class 62 for long and short-wool cross-bred sheep, one-year-old not exceeding 220lbs. live weight, be abolished. That rule 9 having become obsolete be erased. That rule 12, which has hitherto precluded animals being exhibited again except in Extra Stock, be expunged, and the following substituted, by which animals may now be exhibited again in the classes, but not again in the same class, viz.: "No animal exhibited at any previous show of the Club can again compete in the same class."

Rule 21 was amended.

In the division for mountain sheep, the words "not being Cheviot" were added.

Several alterations and corrections were made in the wording of the conditions of some of the classes.

It was resolved, That in future the men in charge of live stock at the Show lead out their animals before the judges.

On the suggestion made at the general meeting that the house-list should be sent either to all members of the Club or to the members of Council being discussed, it was determined that the rule should remain as it is, viz, a list of members of the Council who retire by rotation shall be prepared by the Council. The Council shall prepare a list of the eight members whom they propose for election in place of those who retire, and a copy of this printed list shall be given to any member who applies for it to the Secretary, either on the day of the general meeting or on any of the three days previously (Sunday excepted) between the hours of ten and four.

On the suggestion that a portion of the Council should act with the stewards in the selection of the judges, it was resolved, That such of the eight senior members of the Council as shall not be exhibitors shall be added to the judges' selection committee, which at present consists of the president and

stewards of live stock; also that the said committee shall report their recommendations to the November Council.

It was decided that the Council Meeting and General Meeting during the Show should be held on the Tuesday as heretofore, the former at 11 o'clock, and the latter at 1 o'clock.

It was decided that the Statement of Accounts for the past year should be printed and handed round to the Meeting during the Show, instead of being read by the Hon. Sec. as heretofore.

It was determined to take measures to ensure the herdsmen and shepherds having the prize placards referring to their animals to take home; also that copies of the same be duly prepared to be delivered to the butchers purchasing the animals on their removal from the Show.

The Council gave instructions that the attention of the Agricultural Hall Company be again directed to the subject of improved ventilation in the Pig Hall; also as to more accommodation for the herdsmen and shepherds in attendance on the live stock at the Show.

The application from the *Farmer* newspaper to be placed on the list of papers who receive the Club's advertisements was granted.

Letters were read and instructions given thereon.

The date of the next Show was settled to be as usual, viz., in the week preceding the London great Christmas market.

The Implement Committee was re-appointed, with the same powers as before.

Mr. George Napper, of Wisborough Green, Horsham, Sussex, was elected a Member of the Club.

Mr. Giblett laid before the meeting the following statement relative to the comparative live and dead weights of several of the beasts exhibited at the last show, and gave notice of motion for further consideration of this subject at the next Council: "Reference to the live and dead weights of the animals in the hall, will prove that to continue weighing them alive and procuring the dead weights is both interesting and instructive; for the opinions of owners, buyers, and sellers are often various and in many cases very erroneous, which a reference to the live weights necessarily corrects. It appears from the annexed table that in quite neat steers, small well-bred oxen, and heifers, two-thirds of the live-weight indicates and represents the dead-weight, and that in large coarser animals and cows the offal weighs considerably more than one third. It is well worth the attention of practical men to note in what proportion they differ; but the live weight is a tolerably sure test of worth, taking into consideration that the small best quality beasts are worth so much more per lb. As regards the butchers' interest with respect to fat cattle, particularly at Christmas time, the live weight of the animal is a proof of how much it is worth, the extra weight of part of the offal, viz., the interior fat, being worth nearly as much per lb. as the meat. This is illustrated in Mr. Overman's ox, which carried the extraordinary quantity of 40 st. 4 lbs. of fat, the carcass weighing proportionately less. The Smithfield Club has done much good by encouraging the production of the largest quantity of beef at the earliest age, being greatly to the advantage of feeder and consumer, and discouraging the over-fed monstrosities we used to see at Baker-street. The last exhibition was one of the best in this respect, for its general evenness and quantity of excellent meat. I would recommend that an annual account be published of the live and dead weights, and that butchers be invited to send the weights to the Hon. Secretary, with their names and addresses for publication."

A vote of thanks was passed to The Right Hon. Lord Tredegar (Vice-President), for his lordship's able conduct in the chair.

FRENCH PEASANT FARMERS' SEED FUND.

A meeting of the General Committee of this Fund was held on Monday, January 30, at the Salisbury Hotel, Salisbury-square, to receive a report from the Executive Committee, and to discuss the following motion—"That it is desirable to secure the services of an agent to go to France to aid in the distributions of the committee. Lord VERNON presided. Mr. Brandreth Gibbs, one of the honorary secretaries, read the minutes of the last meeting, which were confirmed. Mr. H. M. Jenkins, another honorary secretary, read the following report of the executive committee.

The Executive Committee beg to lay before the General Committee for England, the following report of the progress already made in carrying out the objects for which they were appointed, viz., the organization of the proceedings of the French Peasant Farmers' Seed Fund, the collection of donations of corn and other seeds, and money subscriptions for their purchase, and the gathering of information as to French requirements—the determination of the period at which distribution should be commenced being specially reserved for the decision of the General Committee.

The Executive Committee having communicated to the several gentlemen named at the meeting on the 5th of January, the wish of the General Committee that they should allow their names to be added thereto, affirmative replies have been received from the following noblemen and gentlemen, who at present constitute the committee:

LORD VERNON, Chairman.

JAMES HOWARD, Esq., M.P., Treasurer.

GENERAL COMMITTEE.

The Earl of Airlie-	J. N. Lee, Esq.
J. Mander Allender, Esq.	Lieut.-Colonel. Loyd Lindsay,

B. T. BRANDRETH GIBBS, }
 H. M. JENKINS. } Hon. Secs.
 W. H. DELANO, }

The Executive Committee were nominated on the principle that every branch of the agricultural interest should be represented; and at present consists of Lord Vernon (chairman), Captain Dashwood, and Messrs. T. Aveling, James Caird, C.B., J. Algernon Clarke, H. Corbet, James Odams, and C. S. Read, M.P., with the Honorary Treasurer and Honorary Secretaries.

The Executive Committee have given their attention to the formation of County Committees, in order that the necessary steps should be taken for the prompt collection of subscriptions. Communications have therefore been sent to the Chairman and Secretary of each Agricultural Society, Chamber of Agriculture, and Farmers' Club, and to such gentlemen in each county as appeared to the Executive Committee most likely, from their influence in their county and their interest in agriculture, to assist in facilitating the movement. Several satisfactory replies have been received, and in some counties meetings have already been held. The exertions which had previously been made by the War Victims' Fund Committee for the supply of seeds to the distressed farmers of the Metz district received the early attention of the Executive, and proposals were made with a view to bring the two Committees into harmonious communication, in the following letter addressed by one of your Honorary Secretaries to the Chairman of the Executive Committee of the War Victims' Fund:

January 14th, 1871.

SIR,—I have the honour to inform you that your letter dated the 7th inst. was laid before the Executive Committee of the French Peasant Farmers' Seed Fund at their meeting last night, when I was instructed to inform you that it was deemed highly desirable to establish a direct communication between the two Committees, and that our Committee will gladly receive at their meetings any representative that the War Victims' Fund Committee may nominate, to attend when subjects affecting the mutual action of the two Committees shall come under consideration; and should the War Victims' Fund Committee desire it, the Executive Committee of the French Peasant Farmers' Seed Fund will be happy to nominate one of its members to attend the meetings of your Committee on similar occasions.

I am, sir, your obedient servant,

H. M. JENKINS, Hon. Sec.

T. G. Darton, Esq, Chairman of the Executive Committee of the War Victims' Fund.

The Executive regret that the War Victims' Fund Committee were of opinion that the plan proposed would not carry out the object in view; but they have the satisfaction of recording the offer of that Committee to place their organization at the disposal of this Fund for the purpose of distributing corn and other seeds in the neighbourhood of Metz and in the Meurthe district.

The following is a scheme of distribution proposed in a letter from M. Drouyn de Lhuys, President of the Société des Agriculteurs de France.

TRANSLATION. — Copy of Letter from M. DROUYN DE LHUYS to LORD VERNON, Chairman of the Committee.

St. Heliers, Jersey, 28th Dec., 1870.

Société des Agriculteurs de France Présidence.

MONSIEUR LE PRESIDENT,—It is a matter of much regret to me that I could not be present at the Meeting held at the Salisbury Hotel on the 19th of this month. I have just read with keen interest the report in the newspapers, and it is my heartfelt desire to express to you the sincere gratitude with which the generous resolutions carried at that Meeting have inspired me. The impulse having been given, I feel convinced that the movement will not be arrested until the object has been obtained; the well-known perseverance of your nation being a sufficient guarantee. The English farmer does not abandon his plough in the middle of the furrow. In order to carry out the project in question, two points must be considered. 1st. The appeal for donations in money and in kind, their collection, a bank to receive the money, and warehouses to store the seed. Measures of this nature have already been partially taken, and will eventually be fully carried out in the three

kingdoms by the efficacious initiative of your Committee, assisted by the unanimous and friendly co-operation of the press in Great Britain. 2nd. The organization in France of committees charged to report the special needs of those localities ravaged by the war, and to prepare the basis of an equitable distribution amongst individuals. It would seem that the most practical combination would be to constitute in each commune a committee composed of the Mayor, or his delegate, of the Vicar and the schoolmaster. This Committee should make out a statement, showing the quantity and kind of seed and other requirements necessary for preparing and sowing the land. To this statement should be subjoined the list of names of those peasant-farmers applying for aid, with the extent of their holdings, and the needs of each of them. This statement, properly certified, should be sent to a Committee formed in the chief town of the district, and composed of the Mayor, the Justice of the Peace, the senior Attorney (Town Clerk), the Magistrates of Quarter Sessions, and three members of the Société des Agriculteurs de France, or of the local agricultural society. This Committee would be charged with collating the statements from the Communal Committee, and with certifying and settling the definitive plan of distribution, which plan should be sent as early as possible to the London Committee. The English consuls and the delegates of the English Committees should take part in the deliberations of the Communal Committees and of the District Committees as often as they might consider it desirable. The District Committees, by the intermediary of the respective Mayors, would deliver to each peasant-farmer, whose application should have been registered, a draft signed by the President of the Committee, and indicating, together with the name and address of the applicant, the quantities and the materials to be handed over to him. It remains to determine the places where the objects (seed) should be deposited, and where the drafts should be presented to obtain delivery. This point will have to be arranged by a common understanding, taking due note of the position of hostile troops, the state of the roads, means of transport, &c., &c., &c. Such, Monsieur le Président, are the observations which I have forwarded to France by last post, reserving full power to make such changes as the London Committee might consider necessary. I beg you to receive, Monsieur le Président, the assurance of my distinguished consideration, and of my sentiments of devotion.—(Signed) DROUYN DE LHUYS, President of the Société des Agriculteurs de France, and Honorary Member of the Royal Agricultural Society of England.

The Executive Committee, in order to obtain information as to the requirements of the French peasant-farmers, have prepared a schedule of queries respecting information under the following heads :

AGRICULTURAL REQUIREMENTS OF FRANCE.—1. What are the agricultural features of your district in the following aspects?

A Kinds of grain and other seeds generally used for sowing.

B Kinds deficient at the present time.

C Latest period of spring sowing. (a) spring wheat, if grown; (b) spring beans or peas, if grown; (c) barley; (d) oats; (e) clovers and grasses; (f) turnips and other roots; (g) potatoes; (h) tares and other fodder crops; (i) any other crop extensively grown in the district.

D What means of cultivating the land are at present possessed by the peasant farmers of the district, viz.: (a) by men; (b) by women and children; (c) by horses; (d) by oxen and other animals; (e) by implements.

2. Can seeds for spring sowing be bought in the district or, if near the frontier, at any depôts across it; and, if so, at what price?

3. What means are possessed by the farmers of the district to enable them to purchase seeds?

TRANSPORT.—1. What is the best route from England to the depôt of your district? 2. What are the best means of transport within your district?

DISTRIBUTION.—(See scheme of M. Drouyn de Lhuys above).—1. Is it your opinion that the departmental and communal organization of the district will admit of such a system of distribution being carried out? 2. If so, do you consider that it can be depended upon for protecting the seeds from misapplication? 3. If not, can you suggest any other plan of distribution; and can you favour the Committee by suggesting the names of any influential men, especially agriculturists, in your district, who could be relied upon to carry it out.

These queries have been communicated to Col. Loyd Lindsay, the Chairman of the National Society for Aid to the Sick and Wounded in War, with the following letter:

French Peasant-Farmers' Seed Fund,
Salisbury Hotel, Salisbury Square, E.C.,
January 16th, 1871.

SIR,—The Executive Committee of the French Peasant-farmers' Seed Fund are very desirous of obtaining reliable information as to the gricultural wants of the peasant farmers of France, in those districts through which the contending armies have actually passed. I have, therefore, been requested to ask you, as Chairman of the "National Society for Aid to the Sick and Wounded," to request the agents of that Society to give what information they may possess on the subject, under the heads mentioned in the annexed schedule.

Any suggestions that may occur to the gentlemen who are engaged in administering aid to the sick and wounded, will be thankfully received by the Committee of the French Peasant-farmers' Seed Fund, whose object it is to provide the distressed peasant-farmers with corn and other seeds wherewith to sow their land, and it is hoped that by helping them to save their next harvest, the Committee may in some measure assist in averting the famine which otherwise seems inevitable. I am desired by the Committee to apologize for asking you to make any further demands upon these gentlemen, knowing how very much their time and thoughts must be engrossed by their arduous and painful occupations. The Committee have no desire to interfere with them in the performance of their recognized duties, and in making this application, rely solely on their well-known readiness to lend a helping hand in a good cause whenever an opportunity offers.

I have the honour to be, sir,

Your obedient servant,

Lieut.-Col. Loyd Lindsay, V.C., M.P.,

VERNON.

Chairman of the National Society for Aid to the Sick and Wounded.

The Executive have much pleasure in laying before the General Committee the following reply from Col. Loyd Lindsay:

National Society for Aid to the Sick and Wounded in War.
2, St. Martin's Place, London, W.C.,
January 17th, 1871.

MY LORD,—I have the honour to acknowledge your letter of this day's date. You are anxious to obtain reliable information as to the agricultural wants of the peasant farmers of France; and your committee address themselves to this Society and desire that their agents in France should reply to certain questions which you forward with your letter. I am empowered to say, on the part of this Committee, that it will be a matter of satisfaction to them if their agents abroad can furnish you with the needed information, and in order that the information may be furnished as promptly as possible, I have this day sent letters to the northern district of France, under the management (so far as the Society goes) of Sir Vincent Eyre, and to the district round Tours and Orleans, under charge of Col. Elphinstone and Mr. Lee. I feel sure that the above-named gentlemen will readily devote their leisure to gaining the information which you seek to obtain, and all details which I may receive from them, or from other sources, I will immediately communicate to you.

I have the honour to be, my Lord, your obedient servant,

R. LOYD LINDSAY,

Lieut.-Col. and Chairman of Committee.

The Right Hon. the Lord Vernon,

Chairman of the French Peasant Farmers'

Seed Fund, Salisbury Square.

Lord Vernon has also, on behalf of the Executive Committee, made a similar request to the Editors of London Daily Papers having special correspondents in the devastated districts of France; and the Executive Committee have great satisfaction in stating that their request has been most readily acceded to.

Letters with information and suggestions have also been received from various sources; and the Executive anticipate that much additional and valuable information for their guidance will shortly be in their possession.

The Executive Committee, immediately upon its appointment, considered it of primary importance to ascertain what assistance they could obtain from the French and German

Governments, in order to protect the seeds destined for the French peasant-farmers from military requisitions. Eventually the following letter was addressed by Lord Vernon to the representatives in England of France and the North-German Confederation :

French Peasant-Farmers' Seed Fund,
Salisbury Hotel, Salisbury Square, London, E.C.
January 9th, 1871.

SIR,—I have the honour to inform your Excellency that at a public meeting held at the above address on Monday, 19th December, 1870, it was resolved to appoint a Committee for the purpose of obtaining donations of spring corn and other seeds as well as money subscriptions for their purchase, to enable the distressed French peasant-farmers to sow their land and thus endeavour to avert the famine which otherwise must necessarily follow next year.

At a meeting of the Committee held on Thursday last, the 5th instant, I was requested as Chairman to submit to you the annexed copy of a resolution referring to the distribution of seeds in the districts of France most urgently requiring the assistance.

In commending this resolution to your Excellency's favourable consideration, I beg respectfully to point out the nature of the assistance required. The distribution of seed corn by the agents of the Committee or the authorities of the Departments will be made only in those districts through which the contending armies have actually passed, and the peasant-farmers of which have by the necessities of military operations been deprived of the means wherewith to sow their land. The Committee are therefore desirous that the corn and other seeds shall be exempt from military requirements. In order to facilitate the practical working of such a concession, the Committee will be prepared to adopt any distinctive bag, mark, tie, or stamp, or any other regulation that your Government may direct.

You will allow me to point out the assistance I have indicated, to be effectual must be rendered immediately. I feel confident, therefore, that your Excellency will represent to your Government the desirability of giving such facilities as may be within their power, to enable the seeds to be conveyed to their destination, and applied to the sole object of sowing the land.

I have the honour to be,

Your obedient servant,

VERNON, Chairman.

The Executive Committee have much gratification in communicating the following telegram, from the Minister of the Interior of France, addressed to the Chargé d'Affaires of France in London, and forwarded by him to the chairman of the Committee :

Bordeaux, Jan. 22nd, 1871.

[TRANSLATION.]

In reply to your telegram of the 14th January, grain intended for seed can be sent to one of our ports; Cherbourg or Brest, or perhaps to Dunkirk. The expenses of transport will be readily defrayed by the Minister of Agriculture and Commerce, should the English Committee desire it. The grain addressed to this Minister will be deposited in the naval magazines until it be possible to transmit it to its destination; it will be exempt from any requisition. Moreover, advice will be given of its destination to the different authorities who have the right of requisition, so that no error can arise. Kindly express to the English Committee the sentiments of gratitude felt by the Government.

The Executive have taken the following means of bringing the objects of the fund under the attention of English agriculturists and the general public: Advertisements and paragraphs have appeared in the newspapers. A letter signed by Lord Vernon, as Chairman, has been addressed to numerous landlords and others connected with the landed interest throughout England, asking for donations in seeds or money, and also that they would use their influence in their own districts. A letter containing printed subscription forms and direction labels for packages has been addressed to every member of the Royal Agricultural Society of England, the Smithfield Club, Central Farmers' Club, and other agricultural associations. Placards have also been prepared for posting in various corn exchanges and other suitable places, and it is hoped that all the above steps, in conjunction with the county committees, either organized already or in course of formation, will lead to a satisfactory result.

The money donations hitherto promised amount to £ of which the sum of £ has already been deposited with the London and County Bank, which will receive donations at all its branches. Also the following donations in grain and seeds have been promised :

The expenditure in advertising, stationery, clerk's time, postage, &c., up to the present time has been £ leaving the balance now at the bankers £

The Executive have the satisfaction of acknowledging the kindness of the clergy who have already had collections at their churches, and they have also received the proceeds of concerts which have been given in aid of the fund.

The Executive have communicated with the various railway companies, in the hope of obtaining free transit for contributions of grain on their respective lines. They have the satisfaction of reporting that the Great Eastern Railway has handsomely granted free transport of Seed addressed to the care of Mr. Odams, at Plaistow Wharf, near Victoria Docks, and of such as may be sent by their Steamers from Harwich *via* Antwerp; and that the South Eastern, and the London, Chatham, and Dover Railways will combine to deliver to France, free of charge, 100 tons weight of Seeds or Corn. The Executive are still in communication with the other railway companies, and trust that some further concessions may eventually be made in favour of the Fund.

Associations with similar objects having been formed in Scotland and Ireland, it was resolved to communicate to each of these what progress had been made by the English Committee, and to ask what steps the Scotch and Irish Committees propose to take, so that the funds may not overlap. The following letter has therefore been addressed to the Chairman of each committee :

French Peasant Farmers' Seed Fund,

Salisbury Hotel, Salisbury-square, E.C., Jan., 1871.

SIR,—I am desired by the London Executive Committee of the French Peasant Farmers' Seed Fund to communicate to you the enclosed copies of letters from the French Minister of the Interior and M. Drouyn de Lhuys* in reference to the question of distributing grain and other seeds to the distressed peasant-farmers of France.

The Committee have communicated with the French and German Ambassadors, in the hope that some arrangement may be made for the neutralization of the seed sent for the use of the peasant-farmers, and they are sanguine that some concession of that nature may be obtained; but owing to the difficulty of communication between London and Versailles, and the length of time required to perform the journey from London to Bordeaux, no answer has yet been received by the Committee from either Government.

Feeling the want of accurate information as to the agricultural necessities of the districts of France through which the armies have actually passed; the means of communication to and within those districts; the state of the communal, departmental, and other legislative or administrative organizations; and the nature of the resources still possessed by the peasant farmers; the Committee are endeavouring to obtain these data through the agency of the gentlemen who are administering the funds of the "National Society for Aid to the Sick and Wounded;" and they have the liveliest satisfaction in acknowledging the readiness and heartiness with which the Committee of that Society have undertaken to further this scheme, by forwarding to their agents the schedule of questions.†

Communications have been made to the Committee of the War Victims' Fund with the desire of promoting cordial and hearty co-operation with them, and I am able to state that they have announced their readiness to distribute any corn or other seeds that the Committee may think fit to place at their disposal.

The Committee are also attempting to make their sources of information as complete as possible, by enlisting the sympathies of the editors of the several London newspapers, who have been requested to forward a copy of the schedule of questions already mentioned to each of their correspondents at the head-quarters of the different French and German armies.

The London Executive Committee have desired me to express their hope that this statement of their proceedings, in anticipation of the difficult task of distribution of grain and seeds that lies before them, may be of use to the Committee

over which you preside; and they have requested me to state that they will be very glad to receive any information which you may have acquired, and to consider any scheme of distribution which you may propose to adopt. Their desire is to place themselves in such intimate relations with the Committees of Scotland and Ireland that there shall be economy in the labour of organization, efficiency in the administration of aid to the peasant-farmers, and at the same time due regard to the attainment of the object for which the seeds and money have been given.

While the Committee have thus devoted considerable attention to the organization of a workable scheme of distribution, they have not forgotten the more pressing duty of collecting donations of seeds and money; and the parcel of documents will inform you fully of the means they have adopted for this purpose.

Assuring you that it will at all times be a source of satisfaction to the London Committee both to impart and to receive information as to the progress of the movement,

I have the honour to be, sir,

Your most obedient servant,

(Signed)

VERNON.

The Executive Committee, having thus reported the steps they have taken and the progress they have made up to the present time, consider it necessary to ask the General Committee for instructions relative to the period at which distribution shall commence, and the means to be employed in carrying it into effect. The question of agency for collecting information or superintending distribution has been under the constant consideration of the Executive, but they have not come to a decision on the subject; and in order to invite discussion, the Treasurer of the Fund has given notice of a motion on the subject to be brought forward to-day. The Executive have had constantly in view the great difficulties by which the question of distribution is surrounded, amidst circumstances ever varying and the vicissitudes of war. An entire postponement of distribution until the close of the war has been strenuously advocated, it being considered that there is no certainty of the donations being applied to their legitimate purpose during the continuance of hostilities. This feeling has taken such firm hold in some districts, that subscriptions are partially withheld, and the work of collection therefore delayed. On the other hand, it has been urged that the work of collection should be vigorously prosecuted, and the organization of a scheme of distribution prepared in anticipation of the close of the war, or such other time as the General Committee may determine. Otherwise it will be impossible for the land to be sown during the coming spring, for the next harvest in the devastated districts to be saved, and for the distressed French peasant-farmer to be rescued from the famine which it is our object to avert. It appears, therefore, to the Executive that, as soon as sufficient supplies are at command, three courses are open to the decision of the General Committee:

1st. To commence distributing as soon as the necessary arrangements can be completed; or, 2nd. To have a partial and experimental distribution which might relieve some of the most urgent needs, and be the means of obtaining valuable data on which to found future operations; or, 3rd. To be in readiness for, but to postpone the distribution entirely until, the termination of the War.

In conclusion, the Executive anticipate that whichever course the General Committee determine upon, they will fully recognize the principle that no distribution shall be made to any district until the Executive have received such guarantees from both the contending Powers as shall satisfactorily indicate that the contributions forwarded shall be held free from requisition, and be duly devoted to the purposes for which they have been subscribed.

By order of the Executive Committee,

B. T. BRANDRETH GIBBS,

H. M. JENKINS,

W. H. DELANO,

} Hon. Secs.

The CHAIRMAN said: Gentlemen, the first thing that will occur to anyone in reading the Report is that circumstances connected with the vicissitudes of the war have rendered the Report obsolete, and in fact out of date. While this makes the Report of somewhat less value, I am quite sure we shall congratulate ourselves, and still more that country which has been desolated by war, that the cloud which has so long hung

over France is rolling back, and the silver lining gradually appearing (cheers). I trust that the Report will at any rate convince you that we have not been negligent of the task assigned to us. We were limited, as you probably remember, to certain well-defined duties, and we have kept entirely within our limits. We have not officially in any way approached the subject of distribution; but, in order to be prepared for a change of circumstances which we thought might occur, and which, happily, now seems likely to occur, we have made some slight attempt at a general inquiry as to the circumstances of various districts of France, so far as we could get at them (Hear, hear). Not being allowed to enter into the question of distribution, and being, moreover, very much restricted as regards means, we did not feel justified in employing any agent to travel abroad and collect information for our guidance; and it certainly becomes me on this occasion to recognize, as I do most heartily, the cordial and prompt assistance rendered to us by Col. Loyd Lindsay, acting on behalf of the National Society, and by various members of the Press whom I addressed personally or by letter, and who, notwithstanding the arduous character of the professional labours in which they are engaged, did not shrink from the additional duties entailed upon them by participation in our object (cheers). I must also acknowledge the courtesy with which I was received by the representatives of the two hostile Governments in this country. Those gentlemen were placed in a very difficult position with regard to the administration of our Fund; and I must say that there has been an evident desire on the part of both Governments to afford us every assistance that we could reasonably expect (cheers). I have now referred to our chief preliminary steps. The first really practical step that we took towards securing a proper organisation was to address ourselves to the various associations at present engaged in alleviating the miseries which prevail in France. I must refer for a moment to the paragraph in the Report which refers to the War Victims' Fund. I do not wish it to be supposed that the difficulties which are there hinted at as existing between that fund and our own are such as will not be easily removed (Hear, hear). I am convinced, from the communications which have passed between myself personally, and gentlemen connected with the War Victims' Fund, that, both Committees being desirous of doing what will most conduce to the effectual carrying out of the work which they have in hand, all difficulties connected with their different organisations will, after proper consultation, disappear (cheers). The War Victims' Fund is represented here to-day by Mr. Bellows, whose letters from the Metz district are well known to the public, and I am quite sure that that gentleman will confirm what I have just said. One of the greatest difficulties which we have to face I will now mention. It must be perfectly evident to all who have served on the Executive Committee that, while there is very deep heart-felt sympathy for the French peasantry under their present distress, the question of affording relief is viewed in a very partial way (Hear, hear). People who have been appealed to for aid have remarked that they did not see how seed-corn could reach the various districts where it was required without being subject to requisition. Two objections, in fact, have been raised, one being, "How can you guarantee that the seed-corn sent will not be eaten by Uhlan horses?" The other, "How can you guarantee that the man who sows shall also reap?" The Report shows that the Committee have done everything in their power to obtain facilities from the two Governments for neutralising the seed and freeing it from military requisition; but it is impossible to guarantee that the person who sows shall also reap. The altered circumstances of the last few days have, however, in my opinion, removed all such difficulties (Hear, hear and cheers). We have now the *littera scripta* of the French Government, who offer such facilities as may, I think, fairly form the basis of a scheme for the transport of seed-corn, provided the distribution of it is decided upon to-day. In our dealing with this question we shall have to consider first of all, whether the distribution is to take place, and, secondly, if the distribution is to take place, in what way it is to be carried out. You will observe that Monsieur Drouyn de Lhuys has in a letter propounded a scheme of distribution, through the agency of the mayors of arrondissements; and if that scheme be adopted, we shall then have to consider whether

we shall employ any controlling agency from home. I would suggest that before separating to-day you should give distinct directions to the executive as to what course you wish them to adopt. Your instructions at the last meeting were very definite; we have known exactly how far to go; and, having decided, if you do decide, on this occasion, that distribution shall take place, you will, I hope, distinctly define the future powers of the executive. If you placed the control of the distribution in the hands of the executive, I feel sure, from my observation of the manner in which my colleagues have hitherto performed their duties, you would have no cause to regret having taken such a step. In conclusion, I cannot help expressing my earnest hope—a hope which is I am sure participated in by every one present—that there is a better future for France than could have been lately anticipated (cheers); and if we in England should be the means of immediately—and it must be immediately (Hear, hear)—relieving a pressing necessity which is no doubt weighing down the spirits of hundreds of people in France, the result will be of the greatest international importance, and we shall thus have taken one of the greatest steps that possibly could be taken to cement permanently the bonds of friendship between the two countries (cheers).

The Earl of AIRLIE said he felt great pleasure in moving the adoption of the Report. It must be a source of great satisfaction to them all that so great a change had just taken place in the aspect of affairs in France, and that there was now a prospect of peace, by which the operations of that Committee would be greatly facilitated. He trusted that there would be such communication between the Scotch and Irish Societies in reference to the object that the three bodies would act harmoniously, and there would be unity in the administration of their respective funds (Hear, hear). With regard to what the chairman had said about the apprehension of some persons that the grain sent out might be eaten by the horses of Uhlans, he would observe, and it was well known that in many cases seed-grain had been steeped in a poisonous solution. The Scotch Society had recommended that the grain destined for France should be subjected to that process, and the adoption of that course would be a guarantee for its being used only for the purpose for which it was intended (Hear, hear).

Captain TALBOT, in seconding the motion, said that if an immediate distribution of seeds did not take place, the object of the Committee would be entirely lost, and urged that the Committee should be invested with full powers as regarded the mode of carrying out the object.

The motion was then passed unanimously.

Mr. CAIRD said he had been requested by Mr. James Howard, M.P., who was prevented by indisposition from being present, to read a statement which he had forwarded. He would now perform that task, premising that he thought it was not improbable that the great change which had just taken place in France would have led to an alteration in Mr. Howard's view. Mr. Caird then read a paper, in which Mr. Howard deprecated the Committee's waiting until the war was over before proceeding to distribute seed-corn in France, and urged that the employment of an agent of the Committee, on the spot, was indispensable to the proper carrying out of the object. Mr. Caird went on to say that, in accordance with this view, Mr. Howard recommended the adoption by the meeting of the following resolution: "That it is desirable to secure the services of an agent to go to France to aid in the distribution of the Committee." Mr. Caird said he did not concur in that view, nor did he think Mr. Howard himself would adhere to it if he were present. There was now a prospect of the termination of the war within three weeks; and, in his opinion, if the war ended within that time the best course would be for the Ministry of Agriculture in France to make arrangements by which such seeds as were collected would be distributed in the districts where they were most required. The Ministry of Agriculture was, it should be remembered, a separate department of the Government, having ramifications all over the country, and he did not think it was possible for the Committee to devise any instrumentality which would answer the purpose so well. With all deference to the Chairman, he thought that to send out anybody from this country to make inquiries would be almost like throwing money away. If they did their utmost in this country to supply what all felt to be a great and imme-

diate necessity—if they endeavoured to obtain from the agriculturists of this land (landed proprietors and farmers) contributions in money and in kind, they would have performed their part; and it would remain for the Government of France, which would now, it was to be hoped, be enabled to act with perfect freedom in the matter, to distribute that which had been supplied. He was sorry that he could not propose a motion suggested by Mr. Howard, but he believed that had that gentleman been present he would now have taken the same view of the matter as he (Mr. Caird) had expressed.

Mr. H. M. JENKINS said he believed that Mr. Howard's paper was sent up with a view to the resolution of which he had given notice being proposed.

Mr. CAIRD said: Well, he could not agree with him. Having sat on the Executive during the whole arrangement of affairs up to that time, and having witnessed the earnestness with which the noble Chairman and others had directed their attention to the object, he felt the utmost confidence, as he believed the public also would; and whatever might be contributed would be dispersed and distributed in such a manner as would result in the greatest possible amount of benefit to their distressed fellow-agriculturists on the other side of the water (Hear, hear). He should therefore propose the following resolution: "That, considering the armistice which has just taken place, and the prospect of an early peace, the committee, recognising the advantage of making an early beginning, entrust to the Executive all the arrangements they may deem most expedient for the distribution of seed, trusting that the instrumentality of the French Minister of Agriculture may be utilised in so far as may be found possible."

Capt. TALBOT said he should be happy to propose the resolution suggested by Mr. James Howard, viz., "That it is desirable to secure the services of an agent to go to France to aid in the distribution of the Committee."

Mr. J. R. ROBINSON said he had great pleasure in seconding it. He thought that the Executive Committee should not be trammelled one way or the other, but the question should at all events be left an open one. Experience had shown that it was impossible properly to administer relief generally without having some agent on the spot who could make inquiries; and although the case of the peasant farmers differed from other cases, yet, in his opinion, it would be a great advantage to employ some one from home who would go from district to district, and from time to time report to the Committee such facts as fell under his observation (Hear, hear). Mr. Caird had spoken as if the Government of France were in full operation. It was difficult to say whether there was any Ministry of Agriculture at present, and even if there were, it could not perform its duties as in ordinary times (Hear, hear). He had that day received a letter from Mr. Bullock, who, as was well known, had spent a great deal of time, and administered a large amount of relief in some of the districts for which the corn-seed was intended. In writing from Levignion on the 24th of January, that gentleman seemed quite appalled by the scenes of desolation which he had just witnessed. He said, "I have at last awakened from a horrid nightmare of gutted houses, broken windows, stove-in doors, shutters wrenched off their hinges, torn-up floors, cupboards turned inside out, bits of carpets, tassels scattered about heedlessly; ruins of chairs, tables, and mirrors; untold heaps of letters and papers littered all over landings, and staircases; lawns trampled into ploughed fields, garden fences broken down—in short, utter desolation everywhere." "To have seen with one's own eyes," he went on to say, "this region, which was once an earthly paradise, literally converted into a howling wilderness, is a fearful experience to have gone through, and cannot fail to leave an ineffaceable impression on the memory." Again he said, "When the siege is over, all—rich and poor alike—will come to bare walls, and every kind of ruin staring them in the face. There will be so much to be done—such overwhelming need of every kind of assistance—that it might appear the wiser course not to attempt to do anything at all. But that is proverbially the case when one attempts to grapple with a gigantic evil." What applied more especially to the great question was the following passage: "I have ascertained, in the course of the last few days, that large quantities of 'Blé de Mars,' i. e., wheat for spring sowing, oats, vetch, lucerne, trefoil, and every kind of grass-seed will be urgently needed throughout the neighbourhood, and especially on the northern side of Paris, to be delivered, if possible, within two months from the present

data. Owing to the impossibility of procuring coal to keep the beetroot sugar factories going, and from the scarcity of hands, the beetroot crop has in many instances been left to rot in the ground, and, in consequence of the unusual severity of the weather, those of the fields which had been sown with wheat in the autumn are now perfectly yellow, into which tint the tender green of the growing crop has been nipped by the frost." Those were facts which seemed to him (Mr. Robinson) to call upon the Committee for speedy and energetic action (cheers).

Mr. AVELING said he felt great pleasure in seconding Mr. Caird's proposal. In considering the question of agency it should be recollected that the districts of France in which seed was required comprised nearly one-fifth of the whole country, or twenty-five-and-a-half millions of acres. Looking at the enormous extent of area to be dealt with, it seemed impossible that an agent of that Committee could carry out the object. The territory to be covered was so large, that to embrace it was like drawing a line from Chester to Lincoln on one side and from the Land's End to the North Foreland on the other, and it would be impossible for any single agent to visit such an immense area.

Mr. H. M. JENKINS hoped Mr. Caird would not press his motion as an amendment to that of Mr. Howard, as they were not necessarily opposed to each other, but rather parallel motions. It was perfectly possible, indeed probable, that the Committee would find that they must distribute the seed through the medium of the French Government, and yet at the same time feel it to be desirable to send an agent to France. Therefore he would ask Mr. Caird to propose his motion as an independent one, leaving that of Mr. Howard to be discussed on its own merits. As regarded the latter motion, even supposing the French Government were disposed to give them all the assistance they might require in the work of distribution, still contributions might come in so largely as to make it desirable to send out not merely one agent, but half-a-dozen (Hear, hear). He would suggest that the motion of Mr. Howard should be amended as follows: "That the Executive Committee be empowered to appoint an agent or agents, at the discretion of the Executive, to aid in the distribution of the Committee." Although the French Ministry of Agriculture might in ordinary times be exceedingly useful, it was now very much disorganized through the war, and he did not think they ought to expect much assistance from it; but he had no doubt that they would be enabled to obtain a considerable amount of information for their guidance from the provincial chambers of agriculture, and the local agricultural societies, more especially those which were connected with the National Society, of which M. Drouyn de Lhuys was the President. Having obtained a large amount of subscriptions from the public, their first duty was to distribute the funds placed at their disposal in a manner which would satisfy their own consciences; but they had another duty to perform, and that was to convince those who had subscribed their money that they had done the best that they possibly could do with it (Hear, hear); and from that point of view it seemed to him highly desirable that the Committee should have one agent at least in France to aid in the distribution and to supply information as to the manner in which it was effected, so that the Committee would be able to give the subscribers some kind of report of what had been done with their money. Mr. Caird and Mr. Aveling seemed to have fallen into a slight error as to the function of the agent whom Mr. Howard desired to have employed. That function would be rather to obtain information and strengthen the hands of those who distributed than to distribute himself. Again he would express a hope that Mr. Caird would propose his motion as a separate one and not as an amendment to Mr. Howard's.

Mr. CAIRD said that as he desired harmony he would adopt that suggestion.

Mr. Caird's motion was then withdrawn for the time, and Mr. Howard's as proposed to be amended by Mr. Jenkins took its place.

The CHAIRMAN said that question of agency was the only ground of difference in the Committee, the opinions of the members having been pretty evenly balanced upon it, and he believed that Mr. Howard's only object then was to obtain for the general Committee power to employ an agency of their own, if that was thought desirable (Hear, hear). He (the Chairman)

had taken some trouble to consult gentlemen who had been in the distressed districts. Among them was Capt. Goodenough, who was familiar with the Metz district, and in the opinion of that gentleman the Committee could not, in the present disorganised state of France, depend entirely upon French organization, which, under other circumstances, would be perfect; and it would be necessary for them to have persons here and there to supervise the distribution, and act as a medium of communication with those whom they represented in London. He should be very glad to see the question decided that day one way or other; and he was of opinion that the powers of the Committee ought not to be restricted to working without agency. He thought it was very desirable that Mr. Jenkins's modified proposal should be adopted by the meeting.

Mr. J. N. LEE, in seconding the motion, observed that a large portion of the distressed district which had suffered most was entirely in the hands of the German authorities, and some of it would probably remain so; and it would not be well, therefore, to place the distribution of seed entirely in the hands of the French Government (Hear, hear).

Mr. BELLOWS, a member of the Committee of the War Victims' Fund, said he should be very sorry to see adopted any motion prohibiting the employment of an agent of the Committee, as some check was absolutely necessary to prevent loose or wasteful distribution. If seed were distributed without any check, for every shilling of value threepence probably would be wasted (Hear, hear). It was more important to watch the spending of the money than the collecting of it. The Committee which he represented had spent an immense amount of money in the neighbourhood of Metz, and it was only by constant hard work and the exercise of great caution that they could avoid a great deal of waste. Unchecked distribution would work in this way. If the mayor of each commune had a quantity of seed to distribute he had to draw a line between those who could afford to pay and those who could not. When a man was known not to be well off, or to be nearly starving there was no difficulty in the matter; but there was always a sort of boundary between those who were known to be well off and those who were known to be badly off, and the mayor being liable to censure if he passed any person over, the result was that in many cases every man was put down (Hear, hear). It should be borne in mind that the Governor of Lorraine was not a Frenchman but a German, and if seed-corn were sent to him there would be a very unpleasant feeling, and many peasant farmers might hardly consent to accept any. Some persons seemed to have thought that the War Victims' Fund and that fund were in some degree acting in opposition to each other. That was not the case; and if the Committee of the Peasant Farmers' Seed Fund should find that they had any surplus seed that they could spare for Metz, his own Committee, would be very happy to undertake its distribution. That very week his Committee had sent out 1,000 quarters of seed-oats to begin with (cheers).

The motion originated by Mr. JAS. HOWARD, as proposed to be amended by Mr. JENKINS, was then put, and adopted unanimously.

Mr. CAIRD, after having renewed his proposal, said he wished to leave it to the Executive Committee to adopt such a course of proceedings as, after due inquiry and watching the course of events, they might think most advantageous. Looking at the extent of the suffering in France, and the probable extent of their means of alleviating it, he was disposed to think that the best course the Executive Committee can pursue was to give a portion of what they had to distribute to the Fund represented by Mr. Bellows, which already occupied an important position in the North of France, and gained the confidence of the people, and to enter itself into a somewhat different field, say that lying to the south of Paris, which would no doubt absorb all the seed that they would be able to distribute, using for that purpose, as far as possible, the instrumentality of the Ministry of Agriculture. He thought that in that way the two societies would most effectually promote the end in view, while it would relieve them from their difficulty with respect to Lorraine. He had no other object in making his motion than to utilize the means at their disposal to the utmost; and he still thought that if Mr. Howard were present he would concur in his view.

Mr. AVELING, in seconding the resolution, said, notwithstanding the explanations which had been given, he did not

see how the distribution could be placed in better hands than the French Ministry of Agriculture. If England were placed in a similar position to France, it would be impossible for a hundred French agents to distribute corn-seed in England in a satisfactory manner; but if it were entrusted to the Society which the Chairman represented there might be a proper distribution.

Mr. AMOS said the great object was, of course, to do that which would be best on the whole. They all knew that although the French Ministry of Agriculture was hampered, the French Société d'Agriculture was in a more independent position. The Committee had, in that society, many warm friends from whom it could obtain assistance.

Mr. PILTER said, having lived for 30 years in France, he could not agree with Mr. Caird that the Ministry of Agriculture would be a good medium of distribution. That department was tied up, as it were, with red tapeism; and, if a cargo of seed were wanted at Havre it might find its way to Nantes, and *vice versa*. If it were proposed to entrust the work of distribution to the Society represented by Mons. Drouyn de Lhuys, he should not object, but he strongly deprecated reliance on the Ministry of Agriculture.

Mr. W. H. DELANO said that any agent would, he believed, go out at his own expense—an observation in which he was supported by Mr. Jenkins.

Mr. PILTER remarked that the Committee had only four weeks for its work. The seed must be in France within four weeks (Hear, hear).

The CHAIRMAN: What district do you consider the first in point of season?

Mr. PILTER replied: The Orleans district, which has unfortunately been in the occupation of the hostile armies. That is the great corn district of France. The land from Chartres to Orleans and from Orleans to Paris is almost entirely in wheat. Next to that district come the north-east and the east.

Mr. J. N. LEE: Was not the Orleans district seeded in the autumn?

Mr. PILTER: No. The armies have been fighting there ever since September.

The resolution was then agreed to.

On the motion of Mr. Sartoris, seconded by Colonel Wilson,

a vote of thanks was given to the daily and the agricultural press for the assistance which it had rendered to the object.

Mr. J. R. ROBINSON said he should be glad to know whether an answer had been received to the inquiry addressed to the representative in England of the North German Confederation.

The CHAIRMAN replied that no official answer had been received, but he felt certain that Count Bernstorff would obtain one as soon as circumstances would permit. His Excellency received him with the greatest kindness.

A vote of thanks was then given to the CHAIRMAN, who, after returning thanks, observed that on the following day the Committee would issue an address to all the Chairmen of a Boards of Guardians, requesting them to put themselves in communication with their respective parishes in furtherance of the object.

Additional subscriptions, amounting in the aggregate to £400, were announced before the meeting separated.

Lord Vernon, the chairman of the committee of this fund, Mr. Caird, C.B., Mr. Odams, and Mr. H. M. Jenkins (hon. secretary, met an influential committee of the Corn Exchange on Thursday last, at 12 o'clock. Mr. Millis Coventry (of the firm of Messrs. Coventry, Sheppard, and Co.) was called to the chair, and the following resolutions were passed unanimously:

1. That a subscription list be opened, and cash received be paid into the London and County Bank in the name of the French Peasant Farmers' Seed Fund, James Howard, M.P., Treasurer.

2. That the Members of the Committee connected with the corn market are willing, free of commission, to purchase such articles as may be required.

3. That the offer of Mr. Pavey to inform the General Committee of suitable agents be accepted.

4. That this Committee be amalgamated with the General Committee, and three members put on the Executive.

The following gentlemen were therefore elected to serve on the Executive Committee of the French Peasant Farmers' Seed Fund: Mr. Harris, Mr. Coventry, Mr. Pavey.

A subscription list was commenced, and it was understood that the result would be made known after Friday's market.

THE GAME LAWS.—HARES AND RABBITS.

At a special meeting of the Scottish Chamber of Agriculture held in Edinburgh, Mr. Scot-Skirving, President, in the chair, the chief business was to consider the recommendations of the directors on the subject of the game-laws.

The SECRETARY laid the following communications on the table:

Mr. M'Combie, M.P., Aberdeen, writes: I regret that I am unable to attend the meeting of the Chamber of Agriculture on the 25th instant, when a resolution is to be proposed for acceptance of the meeting—viz., "That hares and rabbits should be dealt with by removing them from the game list, and giving the occupier of the land, or any resident on the farm having his authority, the inalienable right to kill hares and rabbits on the land so occupied by him." I presume that this proposed measure is only put forward as an instalment of what is expected to follow—viz., the total repeal of the game-laws. Upon this supposition I will support the resolution if it is brought forward in Parliament; but in my opinion the total repeal of the game-laws will be the only satisfactory settlement of the question.

Mr. Cowper, a member, says: I have received your circular, dated 2nd, intimating a special general meeting of the Chamber for 25th instant. In case I may not be present at the meeting, I think it right to intimate that I concur heartily in the resolutions adopted by the directors at their special meeting held on 14th ultimo. The course now taken by the directors has always appeared to me to point to the only remedy suited to the peculiar circumstances of the case as regards the game-laws; and with a view to strengthen their hands in high places, I hope that the members of the Chamber

may be unanimous in adopting these resolutions. Every phase of the farmer's claims for reform has been so often and thoroughly discussed of late, that I am unwilling to enter upon the subject again; but the very extraordinary speech recently delivered by the present Lord Advocate (Mr. Young) as the mouth-piece of a Liberal Government must be my excuse for troubling you with the following observations. Mr. Young's sole argument against the redress of the farmers' grievances is based upon the assumption that landlords and tenants are really and truly both willing parties to existing contracts of lease. Now, in a legal sense, they undoubtedly are consenters, otherwise both parties would not be found to subscribe them; but, in any other sense, they are not consenters, as every member of the Chamber can, with his own heart, testify. While the tenants had no voice in returning representatives to Parliament, the landlords made the existing laws, under which landlord and tenant are not upon an equality in making contracts of lease. I quite agree with the Lord Advocate that as soon as that inequality is removed, and landlord and tenant are placed upon a common platform in this respect, the farmers are quite fit to make their own bargains. This inequality results chiefly from the operation of the law of hypothec and the game-laws. Let the Legislature remove these remnants of the protective and class system, and restore that equality which is deranged, and the interests of landlord and tenant will again become identical. The position of the farmers as voluntary agents to existing contracts of lease under the existing laws reminds one forcibly of a story of Highland volunteers during the Scotch Rebellion. When King George's representative, on meeting a certain laird, and

asking him where his promised volunteers were, received for answer that they were tied with ropes in the barn. Of all businesses in this country the farmer's is the most overstocked, and, probably, for the capital employed, the least lucrative. Under the existing circumstances, a farmer must either make a contract of lease upon the landlord's terms, or cease to be a farmer, or expatriate himself. It is best to look the subject in the face. If he cease to be a farmer, he is, as a rule, fit for nothing else; and, while idle, he cannot sustain himself and his family in their former social position on the interest of his capital—probably bank interest on deposits for safety—as he cannot manage money in other businesses without the probability of losing it. Then it comes to this—he must have a farm on such terms as he can get one, or expatriate himself. Is Government prepared to see the best bone and sinew of this country forced to consider this alternative rather than remove those restrictions affecting the commerce of land, which were long ago removed with so much advantage from every other article of commerce? Reading the Lord Advocate's recent speech as the organ of Her Majesty's Government, I am sorry to be obliged to answer this question in the affirmative. This is very sad. But is the country prepared for this alternative? Are the farmers themselves prepared for this alternative? I am of opinion that the answer to both questions depends now upon the action of the farmers themselves. Let them unite from landsend to landsend as one man. Let them agree upon the true remedies to correct the existing inequality in the law betwixt landlord and tenant, and enforce them through *true* representatives in Parliament, to be chosen by themselves without reference to political creeds. If the farmers act thus, the country will be only too happy to help them. This is a crisis in the history of the British farmer, and I hope he will allow me in all sincerity to remind him, through you, that God helps those who help themselves aright.

A member in Caithness-shire writes: As I cannot be present at your meeting, I write to say that personally I would have preferred Mr. Loch's Bill. If, however, the Chamber is unanimous in adopting the second proposal, I will acquiesce, as I am well aware of the serious loss which the tenant-farmer sustains by the ravages of hares and rabbits on his corn and turnip crops.

Another member in Caithness-shire writes: There can be no doubt but that the deletion of hares and rabbits from the game list would be a great improvement, as it is the beginning of the end; but I also strongly think that the time is past when anything less than the total abolition of the game-laws will satisfy either farmers or the public. Unprotected by statute, by all means let the landlord have full value for what his land can produce, game included, but it cannot be too soon understood that when he sells the use of it he parts with the power of life and death of every animal thereon. One tenant and one interest is certainly quite enough on one farm.

A member in Ross-shire writes: A farm is now letting; the conditions in two points are as follow. In event of abolition of game-laws, tenant to quit in six months thereafter. In the event of abolition of the law of hypothec, terms of payment of rent to be brought forward twelve months. Please to state the bare fact on the 25th.

A member in Aberdeenshire writes: As I find it impossible for me to attend the meeting of the Chamber on the 25th current, when the game question to be discussed, I crave the indulgence of the Chamber, while I briefly state my reasons for dissenting from the resolutions of the directors in proposing a modification of the game-laws; also my humble opinion as to the only satisfactory mode of dealing with this imperial question, viz., total repeal of all statutes for the protection of wild animals (Mr. Lowe's gun-tax included), and my reasons for that opinion. I. Objections to the Proposals of the Directors. 1. The modification of the game-laws proposed by the Directors of the Chamber, if adopted by the Legislature, would be the restoration of a very small modicum of the tenants' rights regarding the protection of their property of which the game-laws unjustly deprive them; while even of this, they in most cases would be deprived by legal ingenuity at the termination of leases now running. But although it were possible to maintain the right, it could be beneficial to only one class of tenants, and that class the least in need of any change in the game-laws, those resident in closely-cultivated districts with little or no cover, and those resident on estates where game is

not much preserved. In such situations tenants of opulence and independence could afford to avail themselves of the boon; but the numerous class of tenants in districts where game is strictly preserved and cover abundant, who are not in a position like the former class to assert their rights, even although free by their leases to do so, could gain no sensible advantage, neither would the proposed change in the least alleviate the oppression of a very numerous third class of farmers whose losses arise from grouse, pheasants, roe, and red deer. 2. Even if the proposed change should prove an effectual remedy to low-country farmers, it would in no degree benefit the upland and Highland tenantry, whose loss arises from winged game and deer; but, on the contrary, it would aggravate the evil inasmuch as it would not put a stop to game-preservation, but would narrow its area, thereby increasing competition for shootings, making the preservation of game more strict, and the burden on the tenants more grievous; while it would be unjust to low-country proprietors, depriving them of all means of sport on their own estates except partridges; while, on the other hand, it would be giving an unfair advantage to Highland proprietors, by giving them a sort of premium in the shape of additional game rents in consequence of the monopoly in sport created by the proposed change. 3. Although the proposed change should prove effectual as to hares and rabbits, winged game being still abundant, and poachers being equally expert in capturing the latter, as the former class of animals, with less risk of detection and better remuneration, no social or moral reformation would flow from it; there would be no diminution in the number of poachers or breakers of the law; and past experience testifies that increased stringency in the law has failed to diminish the evils attendant on poaching, or to diminish the number of poachers. 4. While the legislative sanction of "inalienable rights" would in effect prove abortive for good, the claim of such rights has increased, and intensified opposition to game-law reform, both in and out of Parliament, by its proposed seeming interference with the rights of property; whereas, if the opinions expressed at game-law meetings in West Aberdeenshire by farmers on strictly preserved estates be a fair criterion of the views of tenants on such estates throughout Scotland, it has failed in securing the support of that very numerous class of farmers, and the class which above all others requires at the hand of the Legislature relief from the grievous injustice and oppression under which it labours. The opinions expressed both at Aberdeen and Birmingham testify that the town populations will not support such changes as the Directors indicate, and the agitation of the subject during the last few years shows but too clearly that, without the co-operation of all classes, the day is distant when the country will be freed from the oppressive system of game-preservation, with all its concomitant evils. II. Reasons for the total repeal of the game-laws. 1. The repeal of the game-laws would not only free the occupiers of the soil (who are not possessed of a "ploughgate of land in heritage") from the statutory impediments which at present prevent them from protecting their property (irrespective of any game clauses in leases) from wild animals, but it would also entirely remove from the proprietors all grounds for imputations to which they are at present liable, that being encouraged by the law they appropriate through a certain class of wild animals, what in justice belongs not to themselves, but to their tenants; and whatever bitterness may have arisen between the owners and the occupiers of the soil in consequence of the existing state of matters as to game, would very speedily pass away. 2. If statutory protection to wild animals were removed, their numbers would be very greatly reduced, for the two reasons: (1.) As soon as tenants, and others permitted by them, were free to appropriate these animals for their own use, the proprietors would discontinue the expense they necessarily incur in their preservation, seeing they could no longer be the sole possessors of them; hence a great reduction of gamekeepers and watchers. (2.) A rapid increase in the number of carnivorous animals that feed on game would be the result of a diminution of game protectors, and as soon as the equilibrium of Nature was established no preponderance of any one class of animals could long exist. 3. A reduction in the number of game would be speedily followed by so great a diminution of game rents, as no longer to offer any inducement to proprietors to devote large portions of their estates to the feeding of wild animals exclusively; hence they would see the advantage of

letting these parts of their properties for agricultural or grazing purposes, and thus a very wide field would be opened for agricultural and grazing capital and enterprise, and this (without any legislative enactment infringing the rights of property) would for many years at least check, if not effectually put an end to, that excessive competition for farms which enables proprietors to insert in leases so objectionable clauses for game protection, &c. Besides, the opening up of the country for agricultural and grazing purposes would absorb the surplus unskilled labour in our towns and villages, materially arrest the emigration of our young men to the colonies, favourably act upon our pauperism, not only ultimately increase the home market for our manufactures, but greatly add to our home resources, and lessen our dependence on foreign supply, as well as vastly increase the material wealth of the nation, all which would greatly overbalance any advantage that may arise from the large sums of money brought into the country by sportsmen.

4. The repeal of the game-laws would very soon lead to such a diminution in the number of game, &c., as would make poaching unremunerative, and greatly more difficult than at present, when the poacher's incursions are at least winked at, if not openly encouraged, and this would lead to a great moral and social improvement in our towns and villages, as well as a considerable saving in the expense of punishing crime.

5. The repeal of the game-laws would, in the matter of game, be dealing fairly with the different classes of proprietors and tenants alike; and for the reasons already alluded to, it would be far more likely to enlist the active support of the tenantry, in game-protected estates especially, as well as the hearty sympathy and aid of the town populations, and the labouring classes generally. And as game uncaptured is by law no man's property, the repeal of the game-laws could be no interference with the rights of property.

6. To meet and obviate an objection raised in connection with the supposed destruction of fences, treading down of crops, disturbing of stock, &c., by poachers if the game-laws were repealed, an experience of thirty years as a tenant on an estate where game is not abundant nor strictly preserved, and sixteen years' experience on an estate where game was strictly preserved and abundant, enable me to say, and to say advisedly, that on the former property the annoyance and damage from people trespassing in search of game and otherwise was as nothing in comparison to the annoyance and damage on the latter by sportsmen, gamekeepers, gillies, and dogs; and it is an undoubted fact that many tenants regard poachers as better friends to them than the proprietors who protect game and those employed by them, while the depredations of poachers are as a drop in the bucket compared with the damage done by game, &c. And if the present laws are sufficient to protect the privacy of gentlemen's policies and woods, and also market gardens in the vicinity of large towns, they ought to be sufficient to protect also the farmers' fields, fences, and crops.

A member in Berwickshire writes: I am truly glad that the Chamber has virtually resumed its first position towards the game-laws by restricting its demand to the removal of hares and rabbits from their protection. That demand is so reasonable that so long as we restrict ourselves to it, we are sure of success at no very distant day. I trust that you will have a prosperous meeting.

A member in Dumfriesshire writes: I regret I am unable to attend the meeting of the Chamber of Agriculture on the 25th inst., but beg leave to suggest that only one resolution should be proposed to the special meeting, and that as follows: That the legislative reform now to be sought should be confined to hares and rabbits, giving the occupier of the land, or any one resident on the farm having his authority, the inalienable right to kill the hares and rabbits on the land occupied by him—seeing that if hares and rabbits be removed from the game list all lands will be thrown open to poachers, who, where shooting ground-animals, could not be prosecuted for being in "search of game," and would be liable only under the Trespass Act.

Mr. GEORGE HOPE (Fentonbarns) said: In bringing before you the resolutions proposed by your directors as a solution of the game question, so far as the interests of tenant-farmers are concerned, I have no intention of dilating on the general evils produced by game-laws and the strict preservation of game. We have had enough of that during the last 30 years, and I do not suppose there is a single person present who does

not admit that some change is necessary. We all have acknowledged the evil, but differed as to the remedy. At one period a numerous body of farmers advocated the total abolition of all game-laws, and held public meetings and got up petitions to Parliament for that purpose. For some years I took my share in that labour, but it became obvious that the great majority of farmers did not approve of that remedy. They thought the change too violent, and rather wished to obtain a joint right with the landlord to the game on their farms. In England the game, by law, belongs at present wholly to the occupant of the land, unless he chooses to let it back again to the owner. I may say almost all landlords insist on making this a part of the arrangements when letting farms, and practically the farmers there are no better off than they were previously. It is evident from this that the talk about a joint right with the landlords to the game, still indulged in by a very few members of this Chamber, would, if it were law, to-morrow result in the same state of matters as we know exists south of the Tweed, where the outcry by farmers against game preservation is as loud as it is here. If the farmers there feel compelled to give up the whole of the game, which the law assumes to belong to them, it is not likely their brethren in Scotland would require much pressure to renounce a right given them by law to only a share of it. Shortly after the formation of this Chamber, resolutions were proposed and adopted by it which dropped hares and rabbits from the game list, and recommended amendments to mitigate the rigour of the game-laws, such as securing poachers or presumed poachers a fair trial by Sheriffs of counties, instead of by Justices of the Peace, who may be said thus to be both prosecutors and judges. Also the abolition of separate trials and cumulative penalties for one offence against these laws; and in cases of trials for damage done by game to crops, that the decision of the Sheriff should be final. I may say these resolutions were at first received with the greatest favour, and for a time were accepted by the great majority of farmers as a remedy for the evils under which so many of them writhe. They were embodied in a Bill, and brought before the House of Commons with great ability by our respected friend Mr. M'Lagan, M.P., and to whose services this Chamber is otherwise much indebted. However, the Bill encountered serious opposition in the House of Commons, and has hitherto failed to make way. This has arisen not so much from direct opposition as from the introduction of numerous other Bills all professing to have the same object, though, so far as farmers' grievances are concerned (with one exception, namely, the Bill of Mr. Loch), they were not worth the paper they were written on. The chief feature of Mr. Loch's proposed Bill is, that it makes the killing of hares and rabbits lawful by tenants, or those authorised by them, notwithstanding any agreement with landlords to the contrary. Mr. Loch's Bill has been, and as yet continues to be, warmly supported by a large body of farmers, particularly by our acute friends in Aberdeenshire and the north. Of course this has rendered vain all hopes Mr. M'Lagan may have had of placing his Bill on the statute-book. Possibly the members of Parliament may be entitled, before moving on this question, to say, "Tell us what you want; first agree amongst yourselves before coming to us." Now, there is something in this, and there must be an approach to unanimity before our complaints will be listened to. I more than suspect there are only a very few members of Parliament really in earnest on this question. Some may make promises on the hustings and in their private canvassings, but when once within the walls of St. Stephen's, if they do not laugh at us, they seem to think anything will do as an excuse for shirking their duties so far as trying to find a remedy to mitigate the evils connected with game. Be that as it may, so long as this Chamber itself is divided into two nearly equal hostile factions, besides representatives of the extremes on both sides, all insisting on their own views, it is obvious matters will remain pretty much as they are. Your directors, believing this, held a special meeting to consider whether such an agreement could not be arrived at as would at least protect our crops from destruction, and on which farmers could unite, and thus render their voice in Parliament irresistible, though it might not be to some theoretically the best possible remedy. I am glad to say your directors met with an earnest desire to arrive at some such conclusion, and for the sake of agreement, perhaps, we all yielded somewhat of our own opinions, and I therefore entreat every member present to consider our proposals in

the same liberal spirit. After great consideration, we resolved it would be better to confine our demands solely to what was absolutely essential to enable us to conduct our business as farmers with something like an approach to safety. It is generally admitted that partridges do comparatively little harm, and though, in some cases, pheasants destroy crops to a considerable extent, still they may be looked on as only half-wild poultry reared and fed by hand in plantations, and as they rarely travel far from the coops under which they have been hatched, the damage done by them is confined to certain well known localities; neither is it thought advisable to interfere with grouse or black game. Ultimately your directors resolved: 1st. That the legislative reform now to be sought should be confined to hares and rabbits. We all know that it is the four-footed animals that do by far the greatest amount of damage to crops of all kinds, and also that they increase so rapidly in favourable seasons that great mischief is frequently done, which landlords themselves regret, though they may be unwilling to recompense the tenants in hard cash. Last summer was highly favourable for the breeding of hares in East Lothian, and I know many farmers who complain bitterly of the damage done by them to their grain crops before harvest, and not less of the loss of turnips, which, owing to their being partly eaten, the frost has entirely destroyed within the last few weeks. Well, the second resolution which your directors have to recommend for your adoption is, "That hares and rabbits should be dealt with by removing them from the game list, and giving the occupier of the land, or any one resident on the farm having his authority, the inalienable right to kill the hares and rabbits on the land occupied by him." You will observe that this resolution is an amalgamation of Mr. M'Lagan and Mr. Loch's bills, and, further, is simply the resolution proposed and carried by Mr. Macknight at the last meeting of this Chamber. It was proposed indeed without previous notice, and was only carried by a majority of one, but, after further deliberation, your directors who voted for and against it have now come to the conclusion that its hearty adoption may be the means of again obtaining that unity of action by the members of the Chamber which is absolutely essential for success. At a meeting of the Midland Farmers' Club at Birmingham on the 19th inst., notwithstanding the powerful advocacy of Mr. M'Geachy against all game-laws, the resolution carried was simply to take hares and rabbits out of the game list, and, in the words of the resolution, "the sooner the better." By restricting ourselves to the resolution now proposed by your directors, we can no longer be taunted as advocating "a poachers' bill," and however desirable it may be to lessen the rigours of the punishments for offences against the game-laws, this is a question as much for the public as for us. It does not follow that we, the members of this Chamber of Agriculture, because we find high farming and hares incompatible, should complicate our case by devoting our energies to obtain milder punishments for those who sin against those laws. Now, with respect to Mr. Loch's bill, many of us had strong doubts if it was consistent with good morals to allow tenants to break with impunity verbal, or, it may be, written engagements binding themselves to preserve hares and rabbits for sport to the proprietor. I confess to being one of those who look with extreme distrust upon all laws which free persons from the responsibility of bargains voluntarily entered into. Still we have a few such laws, and this is one, perhaps, as necessary as any already on the statute-book. No sane man would ever enter into an engagement to preserve hares, or agree never to claim damages for crops destroyed by game, unless he was first privately assured that such a thing would never be allowed to take place. Now I am confident that ninety-nine tenants out of a hundred would never touch a hare or rabbit, if they once gave their word to that effect, unless the landlord first broke his promise that hares and rabbits would never be allowed to increase to the extent of materially damaging the crops of the tenant. Hitherto many tenants have trusted their whole fortunes to the good faith of their landlords, and I admit the great majority of them have acted as honourable men. Still we all know that, notwithstanding such promises, many tenants have suffered severely from an increase of game on their farms. If our resolution becomes law, landlords will only have to trust to the honesty of tenants whether a few hares less or more be found on their estates, and I believe the result will be much the same with the

tenants as it has been with the landlords, viz., that the great majority will act honestly. One of the objections brought against Mr. Loch's Bill was that tenants might privately bargain with landlords to leave hares and rabbits untouched, and then let the shooting of them to strangers. In order to obviate this it is proposed to restrict the right of killing them to the tenant himself, or any one residing on the farm having his authority. These resolutions are certainly moderate enough, and yet if they become law I believe the evils of the game-laws, so far as tenant-farmers are concerned, would be substantially, if not altogether, redressed. Self-preservation being the first law of nature, so in this matter we are simply looking after our professional interests, and leaving to others to rectify, if they think fit, the complaints against game and game-laws. But it will not do simply to pass resolutions here; we must be ready to seize every opportunity of choosing our Parliamentary representatives; to select those, and those only, whatever their shade of politics may be, who are at one with us on this question, and more particularly so if they are also ready to vote for the total abolition of the law of hypothec. Farmers have hitherto been a rope of sand, but if we can only obtain unity amongst ourselves, and act with oneness of purpose, there is not the slightest necessity for our suffering under any grievance. I beg to move the following resolutions: "1. That the legislative reform now to be sought should be confined to hares and rabbits. 2. That hares and rabbits should be dealt with by removing them from the game list, and giving the occupier of the land, or any one resident on the farm having his authority, the inalienable right to kill the hares and rabbits on the land occupied by him."

The CHAIRMAN said the meeting had now got the opinion of the directors before them. None of the individual directors had changed their views; but it was found necessary on all hands to yield something, and the matter therefore came before them in the nature of a compromise. The secretary had been asked to draw up a Bill, which was now submitted to the meeting. As far as he (the Chairman) had seen it, it was simply an echo of the resolutions, and those who agreed to the resolutions would support the Bill.

Mr. BARCLAY (Auchlopan, Aberdeen) said that in rising to second the resolution which had just been moved by Mr. Hope, he might very well have allowed the matter to rest in the position in which Mr. Hope had so well placed it; but as he understood—and indeed notice had been given of it—that an amendment was to be proposed in favour of a total abolition of the game-laws, he thought it was desirable, when they were about to take so important a step in connection with this matter, that they should consider the nature of the grievances which they were about to remedy, and how they could most directly accomplish their remedy. The grievance that the farmers complained of at the present time was that the crops which they produced on their farms for the purpose of paying their rents and sustaining their families were eaten up by the landlords' game, and for this they received no recompense, and they were thereby deterred from improving their farms and developing the resources of the soil to the extent they otherwise would do, and so the public interest was damaged by the existing state of matters. The directors of this Chamber had considered the question, and had come to the conclusion that the principles and reforms embodied in the resolutions now submitted would accomplish this desired object very clearly and distinctly. It was unnecessary to ask the question why farmers in taking farms submitted to those unjust conditions they complained of. What with the law of hypothec, the increase and size of the farms, and the consequent decrease in their number, and the increase of population, a tenant to obtain a farm must submit to the landlord's conditions. He might endeavour to get those conditions made as light as possible, but it practically comes to this, if he did not submit to the landlord's conditions, whatever they might be, he must abandon the farm and expatriate himself. This was the grievance of which farmers complained. Now what was the most direct and effectual remedy for this grievance. The most simple and direct remedy was this, that the occupier of land should have the right to kill hares and rabbits on the farms occupied by him; or, in other words, that the farmer should have the right in all circumstances to protect his crops from the ravages of wild animals, without being dependent for that right either upon the will of the landlord

or a lessee. He had heard it, perhaps not seriously, objected to that afterwards the tenants on taking the farm would combine to preserve hares and rabbits; in short, that the landlord and tenant would conspire to evade this Act of Parliament. If this were done, he thought they could have no sympathy with either party, and they might be left to themselves as others were who conspired to injure the public by evasion of an Act of Parliament. He believed that it was probable that an understanding would exist afterwards, either actually expressed verbally or referred to in the lease, that there should be a reasonable amount of game on the land for the purpose of fair and legitimate sport. The farmers would not complain of this, and that the public would not suffer by it. There could be no practical objection to a certain amount of wild animals until the damage caused by them became appreciable. If game was kept down to that limit that it never entered into the consideration of the farmer in projecting improvements, and developing the resources of his soil, the public had no ground of complaint. An understanding of this kind existed already in some cases, and the only difference which the Act would make was that in future the interpretation of it would be in the hands of the tenant, and not, as at present, in the hands of the landlord. The proposed resolutions were not an interference with the rights of property, but was an interference with the abuse of property in land. As to the game-laws in the light of a criminal code, such could find no defenders, and must condemn also the effect they had in the conversion of lands partly arable and partly pasture into deer forests. The effect of the resolutions would be to give the occupier the inalienable control over hares and rabbits upon the land occupied by him, and would prove a direct and simple remedy for the grievance of which farmers complained; and in the next place the effect of the resolutions would in no wise interfere injuriously with the rental derived from land. It was incumbent upon those who moved for the total abolition of the game-laws to show that it would accomplish the object which the directors had now in view as effectively, and at no greater cost than the bill now submitted to the consideration of the meeting. However desirous he was for the reconsideration of the land question, he did not think the present was the time for taking up the subject. He hoped the members would unite in the straightforward step—a step in advance—now proposed, and which would give them a remedy of the grievances complained of.

Mr. RIDDELL (Hundalee) moved the following amendment: "That this Chamber is of opinion that the game-laws are most injurious to agriculture, and constitute in their origin, and the stringency with which they have been maintained, a great class privilege hostile to the common weal. That the whole question has now reached the stage when it is past the necessity of argumentative statement, its sum and substance being to declare that the tendency of these laws is to demoralize alike landlords, their tenantry, and labourers—to produce crime and an endless waste of judicial authority in the State, thereby adding to the heavy rates which affect all classes, and creating a hurtful feeling in society. That every legitimate means should be taken to secure a permanent settlement of this long-standing grievance connected with cultivation of the soil, in the abolition of the game-laws."

Mr. ALEXANDER (Glamis) seconded the amendment. He had been under the impression that they were called together for the purpose of discussing the bills of Mr. Loch and Mr. M'Lagan. At the last meeting the debate on these bills was adjourned by a vote of the Chamber, and they were to have met again to resume the discussion of them. The directors had thought fit to throw that resolution of the Chamber under the table as worthless, and to call them together for another purpose. His opinion was, that if this was the way the business was to be conducted, the Chamber would not long hold together. The position the directors had taken in this question was unintelligible to him. They wished to take hares and rabbits out of the game list and give tenant-farmers the inalienable right to kill these animals upon their farms. He did not see how they could attack hares and rabbits upon any such basis, for as far as these animals were concerned they had the remedy in their own hands, if they chose not to sign a lease which had for its condition the preserving of these animals. The only way in which the game list could be attacked was on these grounds—that these laws were subversive to all good morality in this country, tended to produce crime, were the

cause of 10,000 stupid convictions every year, increased pauperism, and degraded every one whom they affected. They did the crops of agriculturists serious damage, and destroyed the food of the nation. They could go to Parliament to ask it to rectify such evils as these, but they could not go to Parliament to ask them to remedy evils which the farmers produced with their own pens. The directors had limited the grand agitation against the game-laws to a mere question of selfishness. They wished the support of the people of the towns, whom they had absolutely courted, but now they were saying to these people that they did not care a single straw for the demoralisation of the country—that all they wanted them to do was to save the farmers, although they were guilty of this paltry exhibition of selfishness. If the hares and rabbits were excluded from the game-list, what would be the result as far as the crops were concerned? The evil would not be much struck at. The great infantry movement over all the turnip fields of the country would not be put a stop to. What would be the effect so far as the landlord, gamekeeper, and tenant were concerned? The result would be to embitter the relations between them. The landlord was perhaps fond of sport, and came out for some of it, but he might not perhaps find as many birds as he expected. He would blame the keeper, and the latter would answer that he could not help it for the farmers were out every day shooting hares. The landlord would perhaps curse both the farmer and the hares, and the keeper would dodge about the farmer when he was out shooting hares, and would watch him. Did they suppose a British farmer would be out shooting hares and see birds rising before his nose and never knock down one of them? (Hear, hear, and cries of "No, no"). He confessed that he would do it. The next part of the question was that of trespass. It was argued if they did not abolish the game-laws the whole agricultural population would arm themselves with muskets, and would proceed to destroy the game. It would be a good thing for Mr. Lowe if they did, for he would have about four millions of a surplus by his gun-tax; but he did not think they would even be bothered much by anything of the kind. The people did not care a straw for such amusements, and could find better employment at their usual industries. He had been a farmer for many years, and he had never had much cause to complain of trespass. The truth of the matter was that the poachers were the greatest upholders of the game-laws, and themselves confessed that if these laws were abolished their occupation would be gone. In seeking to uphold these laws, they were upholding the poachers.

Mr. MACKNIGHT, an advocate, did not approve of all the resolutions. He agreed with the resolution striking out hares and rabbits out of the game list. He adverted to the word "inalienable," asking what the directors meant by it. If the farmer had the inalienable right to kill game, they might also let that right to other people. If a bill to this effect passed in the terms proposed, it would lead to this that it would be quite competent for the tenant to let the shooting on his farm to any one who would give him a rent for it.

Mr. BARCLAY: It is restricted to those residing on the farm.

Mr. MACKNIGHT maintained that an Act of the kind referred would be strictly interpreted to give the tenant the right if he choose ("No, no"). He objected to the resolution as defective, and as it exposed them to the evils of over-preservation of game from a different party. He deprecated the Chamber being asked to recede from the resolutions of April last, which met with a large share of support in and out of Parliament. He concluded by moving that the resolutions adopted on the 27th April last by the Chamber be continued and adopted in place of the resolutions proposed by the directors.

Mr. BETHUNE (Beboe) supported the resolutions as a reasonable compromise, and as affording a great practical remedy for the grievances of which farmers complained.

Mr. BLUES (Dalruskin) asked if this proposal to give the tenants an inalienable right to hares and rabbits took away the right to kill the game from the landlords (cries of "No, no"). If not, then there could be no overselling of the game by crazed farmers, as hinted at. This proposal by the directors was, he considered, the most reasonable and practicable yet made. Less than this would never satisfy the country, and a reform of the game-laws to this extent would do more for

agriculture materially and morally than anyone could well conceive of.

Mr. LANGLAND (Kemmooh) thought the meaning of the word inalienable might be held to mean that none else save the tenant or a party resident on the farm could destroy the game.

Mr. BINNING HOME (Ergatz) said that twenty odd years ago he gave the tenants on his farms the liberty of killing the rabbits. He could look at the question in a very impartial point of view, because he had been as keen a sportsman as anybody. He had come to the resolution that it was a monstrous shame for animals to be kept which destroyed the tenants' crops. He thought that rabbits were the principal depredators. As regards hares, it was a great mistake to keep them in great numbers. He had not the least hesitation in agreeing with the resolutions proposed, as he thought that they were very wise. They ask for the removal of a real grievance, and did not attempt to ask what would be refused. The probability was that these resolutions would meet with the approval of the country and Legislature. Winged game he thought the farmers should have. It was scarcely possible to have too many partridge, as they destroyed the pests of the farm. He would like a sprinkling of pheasants, but an excessive amount was a crime as affording an inducement to poaching. Pheasants eat the pests of the farm, which the partridges did not pick up. Such pests as hares and rabbits should be put an end to as quickly as possible.

Mr. MACDONALD (Morar) said that in voting upon the resolutions and amendment he could not accord with either, as

he thought it would be becoming in the Chamber to come to a resolution that would be a permanent settlement of the question. The resolutions did not go far enough. He should like to see the question settled in a manner that would destroy all acrimony between the proprietor and tenant. His idea was that if the occupier had the right to kill all kinds of game in his cultivated lands, the game-laws might still exist, and the proprietors would still have the exclusive right in game in the uncultivated portions of the country.

Mr. NICOLL (Littleton, Kirriemuir) regretted the difference of opinion existing in the Chamber as tending to delay a satisfactory settlement of the question. He supported the resolutions.

Mr. WILSON (Hawick) was in favour of having the game the joint property of the landlord and the tenant. He was disposed, however, to waive his own individual sentiments and support the resolutions of the directors.

Mr. BARCLAY having replied,

The resolution was ultimately put in the following terms: "That hares and rabbits should be dealt with by removing them from the game list, and giving the occupier of land a joint right with the landlord to kill hares and rabbits on the land occupied by him; and the tenant's right shall be inalienable, and be exercised by any one having the tenant's authority." This was carried by a large majority, 35 voting for it, and only 11 for the amendment.

It was remitted to the directors to draw up a bill in terms of the resolutions.

A FARM LEASE.

At the annual meeting of the Devon and Cornwall Chamber of Agriculture in Plymouth, the report of the Council having been read by the Secretary, Sir MASSEY LOPES (the Chairman) called the attention to the fact that although the Chamber numbered something like 550 members, yet only 170 appeared to have paid their subscriptions. This certainly was not a satisfactory state of things, and was a matter with respect to which, in his opinion, some steps ought to be taken.

Mr. MOON said there were nearly four hundred members who had not paid their subscriptions.

Mr. W. H. P. Carew, of Anthony, was elected President for the year.

Mr. HENRY CLARK said he first brought forward his Farm Lease because he was asked to do so by a large landed interest, and also by several tenant farmers, and it was an undisputed fact that at that time there was no lease which gave a tenant any compensation at all for unexhausted improvements. His lease was very carefully considered by the Chamber at more than one meeting, amendments in it were made, and eventually it was adopted, after the quitting allowances had been made more favourable to the tenant than was at first proposed. He did not suppose that the lease would be adopted by all the large landowners in the district, but, at the same time, he might mention that some of them had written to him, announcing their intention to accept it, and it had been very favourably spoken of by such practical men as Mr. J. Daw, of Exeter; Mr. Locke, land agent, of North Devon; and Mr. Horwell.

Mr. SPEAR did not believe the lease would at all meet the case. If he were a landlord, he should like to have his own way and his own say and do, but, on the other hand, it seemed to him that if he were a tenant it would be in his power to say, in case he was seeking to occupy a farm, whether he would accept the terms of the landlord or not. He was in favour of 21 years' leases; was of opinion that rents should be paid quarterly, that the landlord's property should be protected from spoliation, that was to say, that no timber should be cut, no falls removed, and no fences put down; and he was also of opinion that a tenant should be free to farm his estate as he pleased, having no restrictions placed upon him as to cropping, as to the manure he should use, or (as to the way in which he should apply it. He was anxious to see a good and satisfactory form of lease settled and arranged, because he

could not help bearing in mind that in the county of Norfolk there were 18,000 acres of land unlet in consequence of the landlords and tenants not being able to agree upon a form of lease that would be generally acceptable.

Sir MASSEY LOPES thought the words in the agenda paper were rather too strong, because he did not understand that the lease of his friend, Mr. Clarke, had been adopted by the Chamber at all (cries of "Yes! yes!"). At any rate he, as a member of the Chamber, had not seen it, and as a landlord he had not adopted it, although at the same time he was not going to say that it was not a capital lease. What he maintained was that the same lease was not at all applicable to poor land and to rich land, nor was it applicable to a dairy-farm and a cereal-crop farm, and therefore it was a matter requiring a vast deal of consideration. He had no desire whatever to throw cold water upon the very able efforts of Mr. Clark, who was really deserving the thanks of the Chamber; but he thought it would have been better if the word "recommended" instead of "adopted" had been inserted in the agenda paper.

Mr. CLARK: I would just mention that if that lease, embodying, as it does, the principle of Tenant-Right, is carried out, it will tend to make some poor land exceedingly good (Hear, hear).

Sir MASSEY: Then it is the best lease I have ever seen (loud laughter and applause). If that is to be the result I will adopt it *in toto*, for I have a deal of poor land.

Mr. GILL contended that the lease was by its clauses applicable both to dairy and cereal farms. But in clause 8 he would suggest that "meadow land" should be substituted for "pasture land," and that no rich pasture or grazing-land should ever, unless with the written consent of the landlord, be mowed.

Mr. CLARK explained that this was the committee's clause, but that the time had passed for any further revision. The question had been raised, and he regretted that Mr. Gill had not been present to give his valuable suggestions.

The CHAIRMAN did not see that he could stop any observations on the lease, because the agenda paper proposed that the Chamber should adopt it—a very grave responsibility.

Mr. GILL called attention to the vagueness of the phrase, "full equivalent" in many of the clauses. No lease was worth the paper it was written on without it well-defined the compensation to be paid to the tenant. The lease started with an

excellent principle, and recognized the duty the landlord and tenant owed to each other. They should, therefore, try and make the lease as practicable as possible: get rid of words that might lead to litigation, and so arrange a schedule of compensation to the out-going tenant that he might not be left to the mercy of an arbitrator. He further suggested that "half-inch bone" should be inserted for "dry bone;" that the dung, or other manure, to replace crops eaten off the farm, should be of the same "money" instead of "manurial" value, and that half-inch bone and dissolved bone ought not to be put in the same category. He objected to the clause referring to the compensation for purchased food for sheep as indefinite. In Lincolnshire half the cost price of the purchased food was allowed to the tenant on leaving, and the sheep are bound to eat half of the food in the stalls or yard that the manure produced should be of good quality. He then moved a resolution to the effect that the form of lease kindly prepared by Mr. Clark, and carefully considered by meetings of this Chamber, is recommended in its general features for the consideration of other Chambers, and that the best thanks of this Chamber be given to Mr. Clark for his valuable services in connection with it.

Mr. SOWTON said the members could have no idea of the pains Mr. Clark had taken in this matter. The committee were not unanimous in their opinion as to what was the best lease to be adopted for the whole district of the Chamber. In Devonshire land that was watered was called meadow, and it was thought that that could fairly be mown; and grass land not watered was called pasture, and it was held that this ought not to be mown without being manured either before or after. It was difficult to frame a lease for one farm, and much more difficult was it to do this for farms in a whole district, with all the varieties of hill and dale and of the soil that they found in the county. A wide margin must, therefore, be left in every lease, and the landlord ought to be satisfied by knowing that his land was not going back, and that his tenant was paying his rent. If they were to have absolute rules for manuring and cropping they may as well have a London tailor for the farmer as the most practical man in the room. Matters should be left to the discretion of practical men to get the greatest amount of produce from the land and leave it in a good state. The Cornish element was so strong on the committee that their system, not at all applicable to the Devonshire system, gave, of course, the tone to the alterations. In conclusion, he saw no advantage in the hares being reserved to the tenant, who ought to preserve them if he had a sporting landlord; and he urged that slate on the roofs should, in all cases of renewal, be substituted for thatch, which now encouraged vermin of all descriptions.

Mr. W. SNELL cordially seconded Mr. Gill's motion. After quiet and careful consideration, they would come to the conclusion that the lease was fair and just between landlord and tenant; but as to its suiting the whole of the farm of the district, it was not intended that it should. No sane man would attempt to frame a lease that should; but the general bearing of the lease would suit all farms, and there must be variations to meet different circumstances. It was a lease which he as a landowner should be glad to let under, and as tenant he should be content to take under. It was a lease under which land was calculated to increase in value, and it gave every protection to the tenant for the outlay of his capital, so that at the end of his lease he would not be under the necessity of sharpening out. If it did all this they got, as tenant farmers, all they asked for, and gave the landlord at the same time all he could wish for. He defied any one to go through the lease clause by clause and show that it does not meet their case. He congratulated Mr. Clark on what he had achieved, for it was a very great improvement on former leases. His only objection to it was that the compensation in favour of the out-going tenant was a little too high, which was, as some would say, erring on the safe side.

Mr. PERRY thought that a schedule, in which Professor Voelcker should assign the value of cattle, foods, and manures, would greatly improve the lease.

Mr. N. ROSEVEARE thought Mr. Gill could not have read the lease carefully, and have considered the bearing of one clause upon the other, to have made the objections he did. It was quite ridiculous to suppose that, because a tenant sold £1 worth of turnips off the estate, that he should bring back the

money-value in artificial manure, when their manurial value was only four or five shillings.

Sir MASSEY LORRE observed that this question was, perhaps, more momentous than any other. He was a great advocate of leases himself, and would not take a tenant without a lease. He had property in another county, where there were no leases but all six months' holdings; but he would not let farms under such holdings. He thought it was only fair to him and to his tenant that there should be a lease, the object of which was to prevent damage to the landlord and loss to the tenant. And the most important thing that could be put into a lease for the tenant is compensation for unexhausted manures and for improvements. In England the landlord, as a rule, did all permanent improvements; the exception was where they were done by the tenant, but when, with the consent of the owner, he did make them, he should be compensated whenever he was turned out. In regard to unexhausted manures, the tenant should have the greatest security for his capital thus laid out; but, with regard to guano and nitrate of soda, it was a question for how long the land was benefitted by their application. His opinion was, that the great benefit was simply to the first crop; and that if a good turnip crop was secured it was as much as they could hope for from artificial manures. He denied that there was any great benefit beyond this from artificial manures. Last season—an unusually dry one—he put in a great quantity of guano, nitrate of soda, &c., and his crops were a failure. Now, if he was going to let his estate, should he be justified in calling on the tenant to pay for those manures, which he believed were volatile, and had passed from the land?

Mr. SNELL mentioned that lime and bones, dissolved bones, or any other purchased manures, were mentioned in the clause.

Sir MASSEY: "Any other purchased manures" was what I stuck at. I am afraid we are going a little too far in the way of artificial manures. I should like to see more lime used, and, better still, more dung, for a great many of the artificial manures are like dram drinking.

Mr. B. SNELL observed that the word "equivalent" was introduced by the committee, who thought it would be presumptuous to define what the manures should be when other new and better things might spring up.

The resolution was put and carried unanimously.

The following is a copy of the lease:

THIS INDENTURE made the _____ day _____ one thousand and eight hundred and _____ between _____ hereinafter called the Landlord, of the one part, and _____ of the parish of _____ in the county of Devon, hereinafter called the Tenant, of the other part.

1. The Landlord agrees to let and the Tenant agrees to take subject to the conditions herein contained the house buildings and farm lands called _____ situate in the parish of _____ in the county of Devon containing _____ acres _____ roods and _____ perches (be the same more or less) the same being more particularly described in the schedule hereunto annexed. To hold the same unto the Tenant (except as hereinafter excepted and reserved) from the twenty-fifth day of March one thousand eight hundred and _____ for the term of fourteen years (renewable three years before the expiration of such term) thence next ensuing at the yearly rent of _____ payable

quarterly on Midsummer-day, Michaelmas-day, Christmas-day and Lady-day by four equal portions except that the last year's rent preceding the expiration of this tenancy shall be considered due and payable in advance (if required) and if not so paid shall and may be recovered as well by distress as by action at law.

2. The Landlord excepting and reserving out of the letting hereby made all mines ores minerals stone gravel slate clay marl and quarries and liberty for himself and all persons duly authorised by him to enter on the said premises and search for dig get and raise dress and prepare on the said premises and carry away the same respectively (allowing the Tenant the proportionate annual value of any land to be

taken for and all surface damage done by any of the said works). And all watercourses streams and springs of water and liberty to turn the same. And all trees tallows standards saplings wood and underwood whatsoever growing or to be grown on the said premises (except brushwood on the hedges) and liberty for the Landlords and others authorized by him to enter upon the said premises and cut bark stack and carry away the same. And to enter and erect buildings or plant trees on and thenceforth retain possession of any part of the said premises (allowing the Tenant a proportionate annual value for all lands so taken and occupied as aforesaid). And all winged game in and about the said premises and full liberty for the Landlord and all persons duly authorized by him to enter hunt course shoot fowl fish and sport on the said premises. And full liberty to pass and repass and to enter on any part of the said premises and view the state of repair and cultivation and to do such works and repairs and erect such buildings thereon for the use and occupation of the Tenant as the Landlord shall think proper and to remove make and plant hedges without making any compensation for so doing.

3. That the Tenant shall pay the rent according to the above reservations and shall pay all rates and taxes to become due and payable in respect of the said premises except the land tax rent charge in lieu of tithes and the Landlord's property tax.

4. That the Tenant shall keep in good repair the house and buildings (except walls and slated roofs which shall be kept in good repair by the Landlord) all machinery wells pumps hedges ditches roads fences gates and sties and shall keep open and cleanse all the ditches drains tunnels watercourses hollow drains and gutters on the said premises and the Tenant shall at his own cost carry the materials for all repairs on the said premises the Landlord providing timber for the same. And the Tenant shall well protect and plant all orchards with good plantable apple trees in lieu of any vacancy that may occur and shall once in seven years well manure the same.

5. That the Tenant shall immediately after cutting the hedges new make them and cast the ditches in a good and workmanlike manner, except when annually clipt.

6. That the Tenant shall cleanse and keep open the iron and lead gutters the eaves guttering and down pipes belonging to the house and buildings and should any damage accrue to the house buildings gates or gate-posts through the wilful act or neglect of the Tenant the same shall be repaired by the Landlord and the whole cost thereof paid to him by the Tenant in addition to the said rent (to be immediately recoverable by distress as in case of rent in arrear).

7. That the Tenant shall not without the previous consent in writing of the Landlord or his steward plough break up convert into tillage or pare or burn any of the meadow or pasture land hereby let or the turf or soil of any part of the lands hereby let under a penalty of fifty pounds for each acre and so in proportion for a greater or less quantity than an acre of the land so damaged (to be immediately recoverable by distress as in case of rent in arrear).

8. That the Tenant shall not mow any of the pasture land excepting watered meadow without manuring it with at least 20 cubic yards of rotten and evenly spread dung per statute acre or a full equivalent in some other approved manure either previous to or immediately after such cutting and not to mow any such pasture land more than once in the same year.

9. That the Tenant shall not grow white straw crops on more than the three-sevenths of the arable land in any one year and not less than one-third the quantity of land in corn or grain in the same year shall be in roots properly cultivated and cleaned and not less than one-third of the land in grain shall be sown with clover and grass seeds in each and every year and those seeds to be sown upon the first corn crop after a green crop. The roots to be manured with at least 25 cubic yards of well rotted and equally spread farm-yard dung per statute acre or a full equivalent in some other approved manure. And where two corn crops are taken in succession one of such crops shall be manured in the same proportions as laid down for the roots. The Tenant not to grow more than two corn crops in succession.

10. That the Landlord or his incoming Tenant shall provide and sow such clover and grass seeds as he or they may think proper in the spring previous to the expiration of the Tenancy and the outgoing Tenant shall work in the same the land so

sown not to be stocked after the first day of November and previous to that time by sheep pigs and calves only.

11. That the Tenant shall consume not less than three-fourths of the root crop nor less than one-half of the straw grown on the premises (excepting the last year when the whole of such root crops and straw shall remain on the premises) and shall for the one-fourth of roots sold or carried away bring back in cattle food dry bones guano or dung the same manurial value as the roots sold or carried away. And the Tenant shall well preserve and annually spread all the dung manure and compost which shall grow arise or be made thereon during the letting hereby made upon the premises and shall on quitting leave all the unconsumed hay reed straw chaff and green crops grown on the premises for the use of the Landlord or his incoming Tenant payment or compensation only being made at a consuming value on the farm for hay and green crops (not to exceed one-eighth of those grown in the year) and dung. And shall set apart not less than one-eighth of the straw for the use of the incoming tenant to be paid for in the same way.

12. That the Tenant shall mow spud or root up all thistles and other noxious weeds on the said premises as often as necessary and not suffer any weeds to seed thereon but endeavour as far as possible to extirpate them.

13. That the Tenant shall allow his Landlord or his incoming Tenant to enter on the first day of July preceding the Lady-day at which the letting hereby made will cease upon all such parts of the lands hereby let as shall come in the course to be sown with wheat (the Landlord or incoming Tenant allowing or paying to the outgoing Tenant one half-year's rent of such parts of the said lands and the rates thereon in full compensation for the same) and in case the outgoing Tenant shall be required to prepare and sow such lands as are in course for wheat he shall do so and be allowed in addition to the half-year's rent and rates as aforesaid for all acts of husbandry the seed corn together with the cost of carrying out any manure that may be required thereon and to enter on all stubble or arishes on the first day of November preceding the said Lady-day and on the 25th day of January so preceding shall enter on all lands (not being pasture) for preparing and tilling the spring crops excepting one-third part of the green crop land in case the same be not cleared off.

14. That the Tenant shall reside upon the premises and shall not assign or underlet or part with the actual and personal possession of any part of the said premises.

15. That if at any time during the continuance of this letting the Tenant shall assign or underlet or part with the actual and personal possession of any part of the said premises without the previous consent in writing of the Landlord or his steward or make default in payment of the rent hereby reserved or in any of the payments hereby agreed to be made payable or make breach in any of the terms stipulations restrictions conditions and agreements hereinbefore contained or become bankrupt or make any composition with creditors or make or give any assignment or bill of sale for the benefit of any creditor or creditors or otherwise be deprived or be liable to be deprived of the possession or occupation of the premises hereby let or the benefit or advantage thereof or if at any time no sufficient distress shall be found on the said premises for the amount of the rent then due or if any execution or process shall issue against the Tenant or any other person or persons under or by virtue of which the stock and crops upon the said premises or any part thereof shall be liable to be seized by the sheriff or any other person then either immediately on the occurring of any or either of the said cases or at any time thereafter at the option of the Landlord the tenancy hereby created shall cease and determine and immediately thereupon and at any time thereafter the Landlord shall have full liberty and power to re-enter upon and thenceforth retain possession of the whole of the said premises.

16. That all notices to be given if for the Landlord may be left at _____ and if for the Tenant may be left on the premises and to have the same effect as if delivered personally to the Landlord or Tenant.

17. That should any dispute arise as to the valuations or as to the non-fulfilment or true construction of any of the clauses of this lease the same shall be settled by two arbitrators one to be chosen by the Landlord or his steward and the other by the Tenant or in case of their disagreeing by an umpire (to

be chosen by such arbitrators) each party within ten days after notice thereof given by the other party to appoint one arbitrator in writing and in case either party shall neglect or refuse to nominate an arbitrator within that time the arbitrator of the other party may proceed in the business alone and the decision of such arbitrator or arbitrators or their umpire (as the case may be) shall be final and conclusive. And the arbitrator or arbitrators so to be appointed or their umpire shall have power to award to the Landlord such damages as they may think reasonable for any breaches of the covenants of this lease that may have been committed by the Tenant and to award to the Tenant such sum as they may determine for any breaches of covenant that may have been committed by the Landlord and compensation according to the schedule of allowances herein contained but it shall not be necessary for such arbitrator or arbitrators or their umpire to specify the respective amounts but to state the balance to be paid by either party to the other.

18. SCHEDULE OF ALLOWANCES.—That on quitting the Tenant shall be entitled to the following allowances for unexhausted purchased manures (the bills for the same duly receipted being produced and satisfactory proof given that such manures have been expended on the said premises) but no purchased manures shall be expended during the last year of the Tenancy without the consent in writing of the Landlord or his steward:

On Pasture Land: When applied in the last year of the Tenancy, the whole cost of lime carriage and manual labour; when applied one year previously, four-fifths of ditto; when applied two years previously, three-fifths of ditto; when applied three years previously, two-fifths of ditto; when applied four years previously, one-fifth of ditto. The net cost of the lime at the kiln railway-station or wharf with a reasonable allowance for carriage and manual labour to be taken as the total cost in the above calculation. The allowance for dry half-inch bones to be made in the same proportions as lime (carriage and manual labour excepted). The bills for all lime and bones expended on the pasture land to be kept separate and the invoices thereof produced to the Landlord or his steward within one month after the carrying on of such manure that he may certify the same if correct.

On Arable Land: When applied upon a crop of corn which shall be in the land at quitting, the whole cost of lime carriage and spreading; when one crop of corn has been taken, one-half of ditto; when one corn crop and one green crop have been taken, one-fourth of ditto. The allowance for dry half-inch bones to be made in the same proportions as lime (carriage and manual labour excepted). Two-thirds of the cost of all dissolved or other bones or such other purchased manures as shall be specially approved by the Landlord or his Steward before being expended in the last year on Lands properly fallowed and sown with turnips rape or mangold wurtzel provided the same does not exceed in value two pounds per acre but no allowance to be made for carriage or manual labour. That the Tenant on quitting shall be entitled to the manorial value of purchased food used for sheep in the field only the bills for the same duly receipted being produced and satisfactory proof given that it has been properly expended on the premises.

A TENANT-RIGHT LEASE.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Seeing in your last paper a notice of a farm lease drawn by me and received at the general meeting of the Devon and Cornwall Chamber of Agriculture, I venture to trouble you with a brief notice of its history, so that those who are not members of the Chamber may the better understand the grounds on which I brought it forward, and the alterations made by the Chamber.

At the request of the Chamber last autumn I undertook to introduce for discussion "Farming Covenants." A bold and great undertaking no doubt; but with the promise of assistance from several practical agriculturists, and feeling that it was a question of all others upon which a Chamber of Agriculture, composed of leading agriculturists, both owners and occupiers, was fully com-

petent to guide and form public opinion, I did not hesitate. The suggestion was then made to me that, in order to give the matter a practical turn, I should introduce what I thought would be a fair farm agreement between landlord and tenant. I at once assented, and at a glance saw how great was the necessity of having the question fully ventilated. I first of all directed my attention to the terms on which estates were held in the district. I found there were leases, yearly agreements, and tenants at will. Some leases and yearly agreements, no doubt, contained fair covenants; others were quite the other way; and others so arbitrary that I wondered any tenant could be found to accept them. Some contained, no doubt, quitting allowances (notably on the St. Aubyn estates, where such an excellent feeling prevails, that the tenants do not care to take leases; and also on the Molesworth property); but none contained a *defined* scale of allowances for unexhausted manures. And believing it to be the duty of every landowner who did not farm, but let his estate to another person to see the probability of the land being made to yield its full increase, to put his tenant under an agreement framed liberally, and that a tenant who enters a farm ought to know as nearly as possible upon what he will be allowed for upon quitting; for when agreements contained no defined allowances for unexhausted improvements, they had to fall back on the custom. And failing to find there was any custom in Devon and Cornwall giving the tenant any compensation for unexhausted improvements, I at once, taking for my basis the natural fertility of the soil as the property of the landlord, and the condition of the soil produced by good farming as the tenant's, proceeded to prepare an agreement, with the assistance of several practical agriculturists, with the view to enable the tenant to farm his estate up to the last day of his term, "not only without deterioration, but with a progressing and increasing fertility of the soil," fully satisfied that he will receive compensation for whatever capital he may invest in the soil.

I launched then at the meeting of the Chamber a farm agreement for a yearly tenancy, with twelve months' notice to quit, based on the principle that the landlord did all permanent improvements, as all landlords should do, embodying an equitable Tenant Right for unexhausted manures, and explained at the time that the principle of tenant-right was equally applicable to a yearly tenancy or a lease. The Chamber received it favourably, and at the next meeting an attempt was made by a few members to draw a false scent across the line by raising the question of yearly tenancy *versus* lease. The farm agreement was then referred to a committee of practical agriculturists; and in order that there might be no misunderstanding as to the principle of tenant-right being as applicable to a lease as a yearly tenancy, I placed before the committee a lease for twenty-one years, together with a farm agreement for a yearly tenancy, with twelve months' notice to quit. Nothing could exceed the care and attention bestowed by the committee on the matter, and after several sittings the lease was presented to the Chamber as altered by the committee. With the treatment of the lease I had no reason to be dissatisfied, since the principle on which the lease was based was approved by them, and the alterations in some instances were an improvement.

In the first place, the committee decided upon a term of fourteen years, renewable three years before the expiration of the term, instead of twenty-one years, as proposed by me. Then there was no material alteration until the cropping clause, which I freely admit is a better clause than that proposed by me, since it is more elastic, and allows the tenant to take two corn crops in succession.

Next the committee pointed out my restrictions on the

sale of farm produce, leaving the tenant free to sell all hay and a proportion of straw and roots on bringing back an equivalent "in manurial value" for roots. But the hardest hit the committee gave me was in striking out lime from the schedule of allowances, and making the schedule in other respects less liberal to the tenant than I proposed.

The lease, so altered by the committee, was submitted to the Chamber, and the Chamber approved the alterations of the Committee, but restored lime to the schedule of allowances. The lease thus altered was approved by the Chamber. That it will generally be adopted is more than I can expect, but that its leading features will be adopted by many landowners I have no doubt. It may

not go far enough for some; but I do not think at present the landowners are prepared to go further. That the principle of Tenant Right will prevail in the end there can be no doubt; it must be so, since the interests of the landowner, the tenant, the labourer, and the public are wrapped up in the land being made to yield its full increase; and unless the tenant has security for his capital, how can this be brought about?

As a landowner myself, I would say to others, lose no time in placing your tenants under agreements with liberal, well-defined compensation clauses; so that when the English Land Bill comes, as undoubtedly it will, you may be in a position to meet it.

HENRY CLARK.

Efford Manor, South Devon.

SCIENTIFIC AGRICULTURE WITH A VIEW TO PROFIT.

The following paper was read by Mr. J. B. Lawes, of Rothamsted, at a recent meeting of the Maidstone Farmers' Club:

"Practice with Science," the motto of the Royal Agricultural Society of England, and "Scientific Agriculture with a View to Profit," the title of the subject we are to discuss this evening, represent very similar ideas. It is true the founders of the Society gave more prominence to "Practice," by placing that word before "Science;" while the committee of the Maidstone Farmers' Club have given to Science the place of honour; but they have indicated in plain and unmistakable language upon what terms they yield the position of distinction to Science—it is only provided it can be followed "with a view to profit." They say in fact to Science, "fill our stack-yards, and our pockets, and you are welcome; but do not trouble us with abstract truths, or speculative opinions, which we cannot turn to profitable account." I think I may assume that your desire to discuss this subject, and my presence here to introduce it, are due in great measure to what some of the members of this Club saw and heard on the occasion of a visit which I had the honour to receive from them, at Rothamsted, during the past summer. They then saw, as many others have seen, that a great deal of active investigation has been, and still is, going on there in connection with agriculture; and I have little doubt they felt some disappointment, as I know others have done, at not being able to see very clearly the direct practical lessons to be learnt from the results of so much labour. If their thoughts were put into words they would probably say, "You have made very interesting experiments on various crops, both with ordinary and with artificial manures; you have conducted numerous experiments on the feeding of stock, and you have a laboratory containing nearly 20,000 bottles; but we wish you to understand that we take no special interest in these things, excepting so far as they relate to our business. We are farmers; our capital is invested in the cultivation of the soil, and the welfare of ourselves and of our families depends upon the profits we can realize. We want to know how, if you were a farmer, with no other source of income, you would use your knowledge to increase your profits; or rather, how, if in addition to our practical knowledge we possessed all the information which you have acquired from your scientific experiments, should we alter our practice to increase our profits?" I take it that, in arranging for this evening's discussion, the Maidstone Farmers' Club hoped, by its means, to arrive at some solution of the above questions. When we consider that the system of agriculture practised by the most intelligent farmers of any district, has been the result of long observation and experience, it must be admitted that any important changes suggested by science should, as far as possible, be based on a knowledge of the principles involved in the existing practices. For example, those who would propose to interfere with the ordinary course of rotation, by substituting a corn-crop for a pulse or a root-crop, may reasonably be asked, not only what description and amount of manure will be required to grow the corn crop? but also, what will be the relative state of fertility in which the land will be left when the one crop has been substituted for the

other? Again, if it be proposed to use artificial manures, instead of producing ordinary manure by the feeding of stock on cake or other purchased food, it is obviously desirable to possess accurate knowledge—not only as to the description and amount of artificial manure required to produce a given crop, but also as to the amount of meat, and the amount and composition of the manure, that will be yielded by the different descriptions of purchased food. Now, I propose to show you, by one or two examples, how much labour and how much money the investigation of subjects having a direct bearing on the practice and profits of agriculture may require before absolute certainty can be arrived at respecting them; and I could, without difficulty, occupy the whole of the time of this meeting in pointing out the various subjects which have been, and still require to be, investigated by men of science, before long established existing practices can be thoroughly explained. I dare say most of you know that the atmosphere which we breathe is composed almost entirely of a mixture of nitrogen and oxygen. The nitrogen constitutes more than three-fourths of the whole by weight, and the quantity of it resting upon every acre of our fields, amounts to more than 32,300 tons. All the crops we grow contain nitrogen, some in larger and some in smaller quantity. Nitrogen is, also, as you well know, a very active and a very expensive element in manures, costing when purchased in artificial manure not much less than one shilling per lb. Accurate knowledge in connection with this substance is, therefore, of the greatest possible interest to the farmer. As all our crops are so dependent upon nitrogen in their food, and as they are surrounded by so large a store of it in the atmosphere throughout their growth, what could be more natural than to suppose that they obtain it from that source? What investigation could be more important than to determine whether they are able to do so or not? and, if they are, to settle to what extent they do so, or by which of them, or under what circumstances, the largest quantity of it can be assimilated. In fact, one of the explanations which has been put forward of the benefits to be derived from a rotation of crops is, that whilst some plants can absorb the nitrogen of the atmosphere, others cannot do so. Here, then, is a question for scientific investigation "with a view to profit;" and what do we find has been done to arrive at a solution of it? Nearly a century ago, Priestley and Ingenhousz came to one conclusion on the subject from their experiments, and Sennebier and Woodhouse to an opposite one from theirs. About the end of the last century and the beginning of the present one, De Saussure took up the question; and, a little more than thirty years ago, Boussingault, one of the most laborious and accurate of living chemists who have devoted themselves to agricultural subjects, commenced the inquiry, and renewed it from time to time, for a period of about twenty years, he arriving at one conclusion, and M. G. Ville, another French chemist, who worked at the subject for many years, coming to an opposite conclusion. Besides these, minor investigations have been undertaken by Méne, Roy, Cloez and Gratiolet, De Luca, Harting, and Chlebodarow and Petzholdt, with considerably varying results. Lastly, the field and other experiments at Rothamsted having shown how important was a definite set-

tlement of this question, and, considering how conflicting was the existing evidence bearing upon it, the investigation was undertaken there, and a very intelligent young American chemist, the late Dr. Pugh, was engaged upon the subject, at the Rothamsted Laboratory, for nearly three years. Well, the result of all this expenditure of time and money, extending over a period of more than three-quarters of a century, is a balance of evidence in favour of the view that the free nitrogen of the atmosphere cannot be assimilated by our crops. One more illustration, and I have done with this part of my subject. It may be taken as an established fact, that if the price of the hay, cake or corn, and roots, which the farmer gives to his oxen and sheep, or of the meal which he gives to his pigs, be charged against the animal, the cost of the food will be more than the increased value in the shape of meat. To show a profit upon the feeding transaction, it is necessary to charge a portion of the cost of the food against the manure obtained. It is, however, quite possible to keep land in high condition for growing corn, without the manure produced by feeding stock. Whether it will be the more advantageous to attain the end by the production of meat and of animal manure, or by the use of artificial manures, is entirely a question of cost, depending on the character of the land, the prices of meat and corn, and the relative cost of certain constituents in cattle manure, and in artificial manures. But, obviously essential elements in the inquiry are—what proportion of the various constituents of the purchased cattle food will be obtained in the form of meat?—what proportion will be expended or lost by the respiration and perspiration of the animal?—and how much will remain as manure? Let me put a case to illustrate the point in question. 1 cwt. of rape-cake will cost six shillings, and 1 cwt. of linseed-cake about twice as much. If applied at once to the soil, these two substances would be of very nearly the same value as manure. Both would supply about 8 lbs. of mineral matter, and about 90 lbs. of organic matter, containing nitrogen equal to about 6½ lbs. of ammonia. But the linseed-cake is first employed for the feeding of stock, and the questions arise—how much of the above constituents will go to form increase? how much will be expended or lost by the vital processes of the animal? and how much will remain for manure? Now, these points can only be settled by very laborious scientific investigation. I could give you a long list of the names of those who have experimented upon one or other branch of the inquiry; and the subject, in one or other of its aspects, has been under experiment at Rothamsted, from time to time, for more than twenty years. Well, it may perhaps safely be assumed that, of the total dry or solid matter of the linseed-cake, not more than 10 per cent., and of its total nitrogen not more than 5 per cent., will be retained by the animal as increase. Of the total solid matter, however, a large proportion will be expended by the respiration of the animal; leaving, in fact, only about 25 or 30 per cent. of the whole as manure. But the essential point whether, besides the small proportion of the nitrogen of the food which is stored up in the increase of the animal, another portion is expended and lost by respiration and perspiration, or whether the whole of that which is not retained by the animal remains for manure, can hardly be said to be absolutely settled. The balance of the evidence is, however, in favour of the view that there is no loss of the nitrogen of the food excepting that which contributes to the increase of the animal, and that which may be due to the decomposition of the manure after the animal has produced it. I have brought forward these illustrations to show you how much time, labour, and money must be expended in scientific inquiry, before some of the most fundamental practices of agriculture can be thoroughly understood; and before, therefore, the £ s. d. standard of calculation can be rigidly applied to them. Whilst, however, much remains to be done before we can discuss some important branches of the science of agriculture “with a view to profit,” we can, I think, in the mean time, learn much from the results of field experiments, if conducted on a sufficiently large scale, for a sufficient length of time, and with due regard to accuracy. I believe the experiments at Rothamsted meet these requirements: and I now propose to consider how far the results of some of them are applicable to agriculture “with a view to profit.” Among the results of the Rothamsted field-experiments there is one fact which stands out with the greatest possible prominence; viz., that certain substances, which constitute a very small

proportion of the crops, exert a very striking influence on their growth when employed as manures. Thus, nitrogen, in the form of ammonia-salts, or nitrate of soda, used in admixture with superphosphate of lime, and applied to the Rothamsted soil when in an agricultural sense in a state of exhaustion—that is when it is unfit to grow another grain-crop without manure—will yield a full crop of corn; and, with a repetition of the manure each year, will continue to do so for many years in succession. For example, a mixture of 300 lbs. of superphosphate of lime, and 200 lbs. of ammonia-salts, applied every year for nineteen years, has yielded almost exactly the same amount of barley as 300 lbs. of superphosphate of lime and 1,000 lbs. of rape-cake, or as fourteen tons of dung, applied annually for the same period. Each of the three has given an average of about forty-eight bushels, or six quarters of barley, and about 28 cwts. of straw. Nitrate of soda has not been used in similar combination for so long a period; but it may be assumed, that if, instead of the 200 lbs. of ammonia-salts, 275 lbs. of nitrate of soda had been employed every year with the superphosphate of lime, almost identically the same result would have been obtained. Now, let us compare the quantity of certain constituents in forty-eight bushels of barley, and its straw, with that of the same constituents contained in the above-named different kinds of manure which will produce it. The following table illustrates the point:

	Dry organic matter.	Mineral matter.	Nitrogen.
	lbs.	lbs.	lbs.
6 qrs. barley and 28 cwts. straw	4,566	196	56
14 tons farm-yard manure	8,540	868	200
1,000 lbs. rape-cake	810	80	50
200 lbs. ammonia-salts	—	—	41
275 lbs. nitrate of soda	—	—	41

Thus, of dry organic matter the crop would contain about 4,566 lbs., or rather more than two tons. Of such substance the annual dressing of dung would supply nearly twice as much, and the rape-cake not one-fifth as much as the crop contained; whilst the ammonia-salts, or nitrate of soda, would supply none at all. Of mineral matter, again, the dung would annually supply very much more, and the rape-cake very much less than the crop contained. Of nitrogen, too, the dung would contain from three to four times as much as the crop; whilst neither the rape-cake, the ammonia-salts, nor the nitrate, would contain as much as the crop. Practically, then, we obtain the same quantity of corn and straw whether we supply much more or much less organic matter than the crop contains, or even none at all. In fact, more than 90 per cent. of the really dry substance of the crop may be derived, either directly or indirectly, from the air and water, and not from the substance of the soil itself, or of the manure. A similar result is brought out even more strikingly in the experiments on the continuous growth of wheat. To one plot in the experimental wheat field, 14 tons of farmyard dung per acre have been applied annually for 27 years in succession; but the amount of produce yielded by it is exceeded by that from mixtures of mineral and nitrogenous manure, supplying no organic matter whatever. It may be considered established, then, that at any rate in the case of moderately heavy soil such as at Rothamsted the only manures required for the production of good corn crops for a number of years in succession are such as will supply certain mineral constituents, and nitrogen, the latter either in the form of ammonia-salts, or nitrate of soda. Referring again to the results with the barley, I wish to recall your attention prominently to the fact, that the 14 tons of farmyard manure, which gave only the same amount of produce as the mixture of superphosphate of lime and ammonia-salts, or superphosphate of lime and nitrate of soda, not only supplied large quantities of organic and mineral constituents of which the artificial mixtures contained none, but it also supplied probably between four and five times as much nitrogen as either of the artificial mixtures, and yet only gave the same amount of crop. The salts of ammonia supplied 41 lbs. of nitrogen in the form of ammonia; the nitrate of soda also 41 lbs. in the form of nitric acid; and, for some years, an amount of ammonia-salts containing 82 lbs. of nitrogen was applied to one series of plots, but this was found to be too much, the crop

generally being too heavy, and laid. Yet, probably about 200lbs. of nitrogen was annually supplied in the dung, but with it there was no over-luxuriance, and no more crop than where 41lbs. of nitrogen was supplied in the form of ammonia or nitric acid. How is this to be accounted for? The answer to this question must be, that the activity of vegetation does not depend alone upon the mere amount of the required constituents provided within the soil; but very materially also on the state of their combination, and distribution, being such that they can be taken by the growing plants. Only a comparatively small proportion of the nitrogen of the dung exists as ready-formed ammonia, and the remainder only very gradually passes into that state of combination. Hence it is that dung is found to be what is considered by some so desirable, namely, a lasting manure; that is to say, a manure which only yields up its fertilising constituents very slowly. Salts of ammonia and nitrate of soda are, on the other hand, both very soluble in water; but, when applied as manure, the ammonia of the ammonia-salts is much more readily absorbed and retained by the soil than is the nitric acid of the nitrate. The latter, consequently, distributes more rapidly, and is more liable to be dissolved by heavy rains, and washed into the drains, or the subsoil; though a portion of the ammonia of the ammonia-salts itself becomes converted into nitric acid, and then is subject, in like manner, to loss by drainage. The farmer has, therefore, to deal with that very important constituent of manure—nitrogen—in very different conditions of combination, in which it acts very differently when applied to the soil. It is probable that when the re-actions of these various descriptions of nitrogenous manure on different descriptions of soil have been more carefully investigated, and are better understood, some considerable saving may be effected in their use. At Rothamsted, in the experiments on wheat less, and in those on barley not much more than half of the nitrogen supplied as ammonia-salts or nitrate of soda is recovered as increase of produce in the first crop; and only from one-sixth to one-fifth of that which is supplied in the form of dung is so recovered. Our attention is now directed to this subject, and experiments are in progress to determine whether a reduced amount of these valuable manures will not yield an equal result, if applied more carefully in close proximity to the growing plant. Taking, however, the Rothamsted experiments as they stand, let us now examine what results they give when brought to the standard of profit and loss. In the barley field the average annual produce obtained by the annual application of 300lbs. of superphosphate of lime, and 200lbs. of salts of ammonia, or instead 275lbs. of nitrate of soda, has been, as already stated, about 6 quarters, or 48 bushels of dressed corn, and 28 cwts. of straw. As the supply of nitrate of soda in the market is much greater than that of the ammonia-salts, I will adopt the nitrate as the basis of calculation. We have then the cost of the crop per acre, approximately as follows:

	£	s.	d.
275 lbs., or say 2½ cwts., nitrate of soda, at 16s.	2	0	0
2½ cwts. superphosphate of lime, at 5s.	0	13	9
Sowing manure	0	1	6
Rent, tithe, and rates	1	15	0
Ploughing	0	10	0
Scarifying	0	3	0
Harrowing	0	4	0
Rolling	0	2	0
Drilling	0	2	0
3 bushels seed, at 4s. 3d.	0	12	9
Hoeing and weeding	0	7	0
Harvesting	0	10	0
Thrashing and dressing, at 2s. per quarter	0	12	0
	£7	13	0

The above may be considered as a close approximation to what would be the annual cost of growing a crop of Barley for a number of years in succession, at Rothamsted.

On the other side of the account we have—	£	s.	d.
6 quarters of dressed barley, at £1 16s. per quarter	10	16	0
3 bushels of offal barley, at 2s. 6d.	0	7	6
28 cwts. of straw, at 1s.	1	8	0
	12	11	6
Cost of crop	7	13	0
Profit per acre	£4	18	6

I will next call your attention to a few of the experiments on the continuous growth of wheat. The first crop of the series was harvested in 1844, and the 28th in succession is now growing. Omitting the results of the first eight years—1844 to 1851 inclusive—when the manures were not exactly the same as they have been since, we have, as in the case of the barley, a period of 19 years—1852 to 1870 inclusive—during which the same manures have been applied to the same plots year after year. Plot 5 has received each year a mixture of salts of potass, soda, and magnesia, and superphosphate of lime; Plot 6 the same mineral manures as Plot 5, with 200 lbs. of ammonia-salts per acre; Plot 7 the same mineral manures, and 400 lbs. of ammonia-salts per acre; and Plot 9 the same mineral manures, and 550 lbs. of nitrate of soda per acre. The following are the average results over the 19 years:

Plots.	Manures.	Aver. Produce.	
		Dressed Corn.	Straw.
		Bush.	Cwts.
5	Mixed Mineral Manure, alone.....	17	15
6	Ditto do., and 200 lbs. am. salts.	27	25
7	Ditto do., and 400 lbs. am. salts.	36	36
9	Ditto do., and 550 lbs. nit. soda.	37	41
2	14 tons Farm-yard dung.	36	34

Thus, the mixed mineral manures alone give, over 19 years, an average annual produce of wheat, of 17 bushels of corn, and 15 cwts. of straw per acre. The addition of 200 lbs. of ammonia-salts per acre to the mineral manures gives an increase of 10 bushels of corn, and 10 cwts. of straw; the addition of 400 lbs. of ammonia-salts to the mineral manures gives an increase of 19 bushels of corn, and 21 cwts. of straw; and the addition of 550 lbs. of nitrate of soda to the mineral manures gives an increase of 20 bushels of corn, and 26 cwts. of straw. The farm-yard dung, on the other hand, gives the same amount of corn, but 2 cwts. less straw than the mineral manures and 400 lbs. of ammonia-salts; and 1 bushel less corn, and 7 cwts. less straw than the mineral manures and 550 lbs. of nitrate of soda. It is evident from these results that, in the case of moderately heavy land like that of the experimental field at Rothamsted, full crops of wheat may be grown for many years in succession, by means of the annual application of certain mineral constituents, with ammonia-salts, or nitrate of soda, in addition. Taking, again, the cost and result with nitrate of soda as the basis of calculation, the following will be the money account per acre of the experiment on the continuous growth of wheat:

	£	s.	d.
550 lbs., or say 5 cwts., nitrate of soda, at 16s.	4	0	0
Salts of potass, soda, and magnesia	2	10	0
2½ cwts. superphosphate of lime, at 5s.	0	13	9
Sowing manure	0	1	6
Rent, tithe, and rates	1	15	0
Ploughing	0	10	0
Scarifying	0	3	0
Harrowing	0	4	0
Rolling	0	2	0
Drilling	0	2	0
2 bushels of seed, at 6s.	0	12	0
Hoeing and weeding	1	0	0
Harvesting	1	0	0
Thrashing and dressing, at 2s. per quarter	0	9	3
	£13	2	6

On the other side of the account we have—

	£	s.	d.
37 bushels of dressed wheat, at 6s.	11	2	0
2½ bushels of offal corn, at 2s.	0	5	0
41 cwts. of straw, at 20s. per load 1,296 lbs.	3	10	10
	14	17	10
Cost of the crop.....	13	2	6
Profit per acre	£1	15	4

There are several reasons why the results with the wheat are

not so satisfactory as those with the barley in point of profit. The crop is much more costly to keep clean; and, as you will see, I have charged seven shillings for hoeing an acre of barley, but twenty shillings for hoeing and cleaning an acre of wheat. Again, for a given weight of corn, there is nearly one-and-a-half times as much wheat-straw as barley-straw; and with the winter-sown and stronger straw crop, we are enabled, in the average of seasons, to ripen a greater weight of total produce. The result is that, to obtain a full crop of wheat, we have to employ about twice as much ammonia-salts, or nitrate of soda, as is required to yield what may be called a corresponding crop of barley. Thus 48 bushels of barley and 36 or 37 bushels of wheat may be taken as of nearly equal money value; but to grow 48 bushels of barley we have used only 200lbs. of ammonia-salts, or 275lbs. of nitrate of soda, producing at the same time only 28 cwts. of straw; whereas to get 36 or 37 bushels of wheat, we used 400lbs. of ammonia-salts, or 550lbs. nitrate of soda, and produced about two tons of straw, withdrawing of course, at the same time, much more mineral matter from the soil. It is obvious that in growing wheat or barley year after year by the manures above described, and removing both corn and straw from the land, the exhaustion of mineral constituents will show itself sooner in the case of wheat than in that of barley. Hence it is that, in the wheat account given above, there is the heavy charge of 50s. for salts of potass, soda, and magnesia, whilst there is no such charge against the barley crop. The amount of those salts annually used in the particular experiments quoted was, it is true, considerably more than would be required to compensate for the exhaustion by the increase of crop obtained. It must be distinctly borne in mind, however, that the Rothamsted experiments are not arranged with a view to providing direct examples of profit. At the same time, the fact is clearly brought out that more money must be expended on nitrogenous manures to yield a given money-value in wheat-grain than an equal value in barley-grain. Calculations show, indeed, that, of a given amount of the expensive constituent nitrogen supplied in manure, a larger proportion is taken up from the soil by the barley than by the wheat crop. To conclude, in regard to the wheat experiments, I am sure you will agree with me that the fact of having removed 27 full crops in succession from the same land, is one of the greatest possible interest and importance, as showing what constituents must, and what need not, be applied to the soil for the successful growth of the crop. But, although the growth of wheat under such circumstances may require the employment, as manure, of expensive constituents, such as potass, it is by no means to be concluded that such manures would be requisite under the very much modified application of the system of more frequent corn-growing, which could alone be followed in farming "with a view to profit." As the experiments on the continuous growth of oats, at Rothamsted, have as yet only extended over two seasons, I will not occupy your time by following up the illustration as to profit in regard to that crop. The land devoted to the experiments was dunged for beans in 1864, it then grew wheat in 1865, beans in 1866, and wheat in 1867 and 1868, all without manure; and the first experimental oat-crop was taken in 1869. In regard to the results, it will suffice to say that the same mixture of superphosphate of lime, salts of the alkalies, and ammonia-salts, or nitrate of soda, as was employed for the wheat (on plots 7 and 9 respectively), gave in the favourable season of 1869 about 70 bushels of oats, and about 50 cwts. of straw, and in the unfavourable one of 1870 about 50 bushels of oats and 28½ cwts. of straw. I will now direct your attention to some experiments on rotation. In one field at Rothamsted an experiment on rotation or crops has now been carried on for nearly twenty-four years. The course followed is—turnips; barley; clover, beans, or fallow; and wheat. On one portion the swedes are very highly manured with a mixture of rape-cake, salts of ammonia, superphosphate of lime, and salts of potass, soda, and magnesia. From one-half of this piece the whole of the swedes, both roots and tops, are carted off; and on the other half the crop is consumed on the land by sheep. The 24th crop, that is the last of the sixth course, is now growing. Omitting the first course, in which Norfolk whites and clover were grown, and the sixth, which is not yet completed, the following are the quantities of roots, and of dressed corn, per acre, obtained in the second, third, fourth, and fifth courses:

Crop, &c.	Swedes carted off the land.	Swedes consumed on land.
2nd COURSE.		
1852.....	Swedes ... 19½ tons	... 19½ tons.
1853.....	Barley ... 38½ bushels	... 35½ bushels.
1854.....	Beans ... 10 "	... 13½ "
1855.....	Wheat ... 37½ "	... 40½ "
3rd COURSE.		
1856.....	Swedes ... 16½ tons	... 17 tons.
1857.....	Barley ... 48 bushels	... 63½ bushels.
1858.....	Beans ... 12½ "	... 14½ "
1859.....	Wheat ... 39½ "	... 38½ "
4th COURSE.		
1860.....	Swedes ... 4½ tons	... 13½ tons.
1861.....	Barley ... 60½ bushels	... 54½ bushels.
1862.....	Beans ... 43½ "	... 41½ "
1863.....	Wheat ... 46½ "	... 44½ "
5th COURSE.		
1864.....	Swedes ... 8½ tons	... 8½ tons.
1865.....	Barley ... 47½ bushels	... 43½ bushels.
1866.....	Beans ... 20½ "	... 24½ "
1867.....	Wheat ... 23½ "	... 31½ "
SUMMARY—AVERAGE OF THE FOUR COURSES.		
1852, '56, '60, '64...	Swedes ... 12½ tons	... 12 tons.
1853, '57, '61, '65...	Barley ... 48½ bushels	... 49 bushels.
1854, '58, '62, '66...	Beans ... 21½ "	... 23½ "
1855, '59, '63, '67...	Wheat ... 36½ "	... 36½ "

Thus, the average produce of swedes was about 12 tons of roots, and there were besides about ½ ton of tops. The manures applied to each crop of turnips, if they had been employed directly for barley, would have been sufficient to grow three crops of about 6 quarters each; that is, in all, 18 quarters of barley. Yet, we find that the average yield of the rotation where the whole of the roots were consumed on the land, was almost exactly the same as where they had been carted off. The condition of these two plots must, however, have been very different. The amount of nitrogen, alone, returned to the land by the stock consuming the turnip crop, would probably be equal to that contained in between 400 and 500 lbs. of nitrate of soda. From the results of these experiments we may learn: 1. That the growth of the root-crop did not of itself contribute anything to the fertility of the land. 2. That the treading of the land by the stock was injurious to the succeeding barley-crop. 3. That it is not alone the quantity of manurial constituents applied, which determines the amount of the crop; but that the effect depends very much upon the condition in which the constituents exist within the soil. A careful consideration of these results, and also of those of experiments in which swedes have been grown year after year for many years in succession on the same land, leads me to the conclusion, that on the heavier class of soils, where the treading of sheep is injurious, the turnip crop, if not out of place, might at all events with advantage occupy a much less proportion of the area of the farm than it usually does. There are many and obvious reasons why it would be impracticable to devote the whole of the arable land of a farm to the growth of corn; and if I were farming with a view to profit alone, I should not attempt to do so. But, taking as a basis the facts that, on moderately heavy, and heavy land, full crops of wheat, barley, or oats, may be grown with certainty for some years in succession, by means of artificial manures containing soluble phosphate, and nitrogen in the form of ammonia or nitric acid, and that the increased produce obtained by these manures is remunerative, I should certainly devote a much larger proportion of my land to corn than is usual in the district. To give an example of what I have done in this direction, I may mention that a field adjoining the experimental barley field, received a heavy dressing of dung and artificial manure for mangolds in 1866, and since then it has grown wheat, oats, barley, and barley, in succession. The last two crops of barley have each been fully seven quarters per acre; and another corn crop is to be taken from the land in the coming season. I am also disposed to give up the growth of turnips altogether; growing no other roots but mangolds, and these probably to the extent of not more than 1-15th or 1-20th of the arable land of the farm. Under this system the land for the mangolds should be manured very heavily with dung, applied partly in the autumn

and partly in the spring, and also with artificial manure at the time of sowing. It would be advisable, too, to prepare the land for the spring corn as much as possible in the autumn, by means of steam; and, of course, altogether to avoid injury by treading with sheep in wet weather. To what extent such a system would be applicable and profitable in other districts must be left in great measure to the judgment of the individual farmer to decide. In the "Report on the Farm-Prize Competition, 1870," published in the last number of the *Journal of the Royal Agricultural Society of England*, Mr. Keary condemns the system of growing more frequent corn crops, by the use of artificial manures. On the other hand, in the *Agricultural Gazette*, for November 5, and November 19, we have an account of the successful cultivation of a farm on which 330 to 350 acres of grain are grown out of a total area of 450. The whole produce, corn and straw, is sold off the farm; no stock is kept; and no meat is produced. There can be no difficulty whatever in agreeing with Mr. Keary in doubting whether, upon light soils, where the treading of sheep is beneficial, "the alternation of green and white crops can properly be departed from;" and, for my part, I do not recommend that it should be on such soils, unless under very special circumstances. I equally agree with Mr. Prout, that on soils of quite another description, both roots and stock may be more plague than profit; and, in fact, that, by means of steam, or other deep cultivation, and the judicious employment of those special fertilizers which experience shows to be advantageous, remunerative corn-crops can be grown over a larger area of the farm than is consistent with our recognised sys-

tems of rotation. Cleanliness is, however, an essential element in the profitable growth of corn; and when the land becomes foul, the corn growing should be suspended, and a fallow or cleaning crop taken. The time is past for maintaining a servile adherence to fixed systems of rotation as essential to profitable agriculture, whatever the description of the land, the intelligence of the farmer, or the local conditions of his farm. Whether we look to the greatly extended knowledge of the present cultivators of the soil, to the greatly increased command of the elements of fertility in the form of purchased cattle foods and manures, to the marvellous development of mechanical appliances, or to the increased facilities for transit and for the carriage of produce, it must be admitted that the farmer of the present day, as compared with his predecessors, has very marked advantages. And it is only reasonable to suppose, that these great changes should have a commensurate influence in modifying systems and practices which owe their origin, and their reason, to other times and to other circumstances. In conclusion: if those who farm "with a view to profit" can gather nothing else from the results of the Rothamsted experiments, they may at least learn with what certainty of result certain manurial substances may be employed for the increased production of some of the most important crops which they cultivate; and I am sure I may safely leave it to the intelligence and the judgment of those I am addressing, to decide, each for himself, how far his own particular soil, and other circumstances, will justify him in modifying his present practice in the direction I have indicated.

LAND TENURE.

At the annual meeting of the Nottinghamshire Chamber of Agriculture, in Nottingham, Mr. T. B. T. Hildyard, M.P., in the chair, the attendance of members was lamentably small, although this was fair day.

Mr. GEO. STORRE said there was a question which was very likely to come up, and that was the question of Tenant-Right. He thought it would be a very fair subject for discussion, for from what they saw and read in various quarters there was a great difference throughout the country on the way in which Tenant-Right was valued, injustice being done in some cases to the tenant and in others to the landlord, from the subject not being thoroughly understood, and from its varying so much in different places. The Lincolnshire plan appeared to be the one most generally approved, and under it the land in Lincolnshire increased in value to a great extent, and both the landlord and the tenant had been immensely benefited by it. The Lincolnshire plan appeared to be one of the most perfect, but at all events he thought it would be a very fair question for their consideration. He merely suggested these things, but there was nothing particular before them that day. He was sorry the meeting was not a larger one, for they had fixed it for the fair day in the hope that a large number of gentlemen might be able to be present.

The Rev. C. NEVILLE said a distinct class of subjects was those with which the Government had not or ought not to have much to do, and that was the relation between landlord and tenant, whether the farms should be held on leases or not, whether it should be Tenant-Right, and so forth. Many farmers had good landlords, and they felt a delicacy, which he certainly admired, in coming forward to discuss the question of leases and of the game laws, but he being a land owner need not feel any delicacy of the kind. He considered it would be a great advantage if they could have all these subjects connected with the holding of land freely and fairly discussed between landlord and tenant. He was sorry that the landlords, personally, did not take more interest in Chambers of Agriculture. He thought that by not doing so they stood in their own light, and he regretted very much that they as a class did not attend the meetings more. There were some landlords whom they could not reasonably expect to attend, but they had qualified agents who managed their estates, and it would be very easy for them to attend. If he was a large landlord, with estates all over the country, if he were unable to attend himself, he should desire his agent to be present at these meetings, to be able to speak

in his behalf, to admit what was right, to contradict what was unreasonable, and to join in a fair and free discussion of these subjects. At first sight it appeared to be the landlord's interest to let his land at 30s. per acre, and to the tenant's to get it at 25s., and their interests appeared rather opposed. At first sight, also, it appeared to be to the landlord's interest to keep a large quantity of game, and to send it up to Leamdenhall Market; and as it was injurious to the tenant to have so much game on the land, at first sight their interests again appeared opposed in that respect. He had, however, been a landowner for a number of years, and he was certain, on looking round, that their interests were really identical, or nearly so. A landlord who preserved a great deal of game, to the injury of his tenant, might go on for a time and not feel it, but in the long run he must suffer most severely, in two ways. It was impossible that any tenant would give the same rent for land that was over-run with game as he would for land on which the game was kept down in moderate proportion. Tenants were not now as they used to be a hundred years ago, when every tenant-farmer had a boy under him, and had scarcely anything to do but to grease his boots and take his hat off to his landlord. In these days, as everybody of common-sense knew, the tenant-farmers of the country were in a great measure educated men, and were as far superior to what the country squires were a hundred years ago as could possibly be. If a landlord had his farm over-run with game, he must lose that class of tenant, for there was not only the damage that the game did, but there was the effect which that damage had on a man's mind. No man could farm well unless he took a pleasure in it; and what man, therefore, could possibly farm when he saw a lot of hares and rabbits eating up his corn? If they gave him compensation, no one could well know how much to give, and even if they did this a man still did not take the same pleasure in his farm as he would do if he gathered in his crop and made the best he could of it. If the landlord persisted, therefore, in over-stocking his land with game he must, in the long run, drive the best tenants from his estates. The question of leases was also a very serious and a very complicated question, and it could be freely and fairly discussed with considerable advantage. The valuation was generally done by the agent, and his opinion about an agent was, that he ought to be a third man—an umpire. If an agent said "my employer has £20,000 a year, and he wants to get £25,000 more, I must get it for him," he was a

had man, and not fit for his position. He was a good agent who said, "It is true you want more money, but this farm is too poor to pay so much." Referring to the question of leases, if a landlord let his land at say 25s. per acre, and in the course of a short time, in consequence of some gold discoveries or something of that kind, the price of corn doubled, he could not expect the tenant to come to him and to say in consequence of the change the land is worth 50s. per acre; but, on the other hand, supposing the price of corn fell very considerably, or the rates rose very much, the landlord must either sit still until his tenant was ruined and then alter the rent, or else, when the tenant failed, he must try to get another and break him, and so on, which no landlord ought to do. A difficulty consequently arose because the lease seemed to bind one party and not another. Taking a farmer's view of the question, he found that men who were farming well, and who had a deal of capital invested in their farms, were, in some cases, liable to receive notice to quit next Lady-day. That was not a position in which a tenant-farmer of that character ought to be in. There ought to be some means of giving proper security to a tenant who was farming highly. One way of doing it was by means of leases about which there was a difficulty, and the other was by Tenant-Right. The best plan he considered, however, was for the landlord to do the whole of the requisite improvement, and he had told his tenants never to invest a shilling on a permanent part of their farms. They had better let him do the whole and pay him a reasonable interest, for he was convinced that it was a bad plan for tenants to be encouraged to sink their capital in draining and improving an estate. This was, of course, a question for discussion, but he could not but think that the more secure a tenant could be made in his holding as long as he farmed it well and paid his rent the better it would be for the landlord, and the more happy and comfortable and independent the position of the tenant the better for the estate. It had been said that a good landlord was the best security. There might be some weight in that argument, but they must remember that if they had a good landlord they did not know what the next might be, and as far as that went the security might terminate by the breaking of a railway spring. Liberality was a great thing in landlords, but it was no use if the landlord had not got a sixpence in his pocket. He held, therefore, that the best landlord that could possibly be was not sufficient security for the tenant. The plan that he suggested for Ireland was that every tenant on receiving notice to quit should have power to call in a court of Equity and to receive what was equitable and right. As there was nothing that he would propose for Ireland that he would not submit to himself, if at any time any tenant of his thought he was injured and pressed upon, or that he was turned out of his farm before he had had time to get back what he had put upon it, he should be willing to go to Lincoln market and to choose five respectable tenant farmers and leave it to them, and pay every shilling that they said was due. He thought that the subjects to which he had

referred would form good subjects for consideration, and advantage might arise if they were only freely and fairly discussed.

Mr. BEARDALL said that the prosperity of English farming, and the high state of culture in which the land was, was not in consequence of yearly tenancy, but in spite of it. If farm leases were generally adopted by the great bulk of land-owners in the country, land would be worth more than it was, and the remuneration which tenant-farmers would get would be considerably increased. In the lowlands of Scotland the great bulk of the farmers were men of capital, and the farms being let on leases, they could offer better rents, because it answered their purpose to farm in a more expensive way than yearly tenants dare farm.

Mr. WALKER thought that the less they disturbed the rights of private property the better, as it might lead to complications which would not suit the tenant-farmer as a floating capitalist, any more than it would the landlord as a fixed capitalist. He looked on the landlord as the natural farmer of the land, between whom and the consumer the tenant farmer came in, and he ought to be treated fairly and justly so that his floating capital should not be subject to loss. It would not, he thought, be subject to loss if he was always allowed to have so much notice and it was to be allowed to expire on the same system as that on which the land was farmed.

Mr. GILBERT, (Barnby) said he thought that, besides considering the subjects of the malt-tax and local taxation, they might discuss the working and administration of the present poor laws in agricultural districts. There were also several other subjects which could be taken up with advantage.

Mr. BEARDALL observed that they had discussed the question of local taxation until it was almost threadbare, and he deprecated the idea of the Chamber being tied down to one subject.

Mr. HUSKINSON, who had suggested the subject, said that being a new member of the Chamber, he was not aware of all that had been done.

At the dinner, which followed, the Rev. C. NEVILLE said the happiness and comfort of fifty tenants and their families was of more consequence than one landlord, and he thought, therefore, that the tenant ought to be considered. But tenant-farmers should also remember that the welfare of ten labourers was of more consequence than of one tenant-farmer. Politics made no difference to him in the treatment of his tenantry, and he once learnt a lesson in that respect from a Tory—the late Sir Tatton Sykes. The baronet was mentioning his dislike to one of his tenants who was "conceited and a Radical." A great Conservative agent who was present thought he had a fine field for action, and said Sir Tatton really ought not to have such a tenant. Sir Tatton, however, replied, "I cannot give him notice to quit, because he can grow better turnips than I can, and I can smell his guano a mile off. I don't like to meet him because I am afraid he will give me notice that he shall leave, because I'm a Tory."

FOOD FOR STOCK.

At the monthly meeting of the Swindon Chamber of Agriculture, at Swindon, Mr. JAMES BEAVEN, in the chair, said Mr. Pinniger was a man of large and varied experience. He was the owner of an extensive herd, not only in this district, but also in London, and having to provide for so many head of stock peculiarly qualified him to speak on the subject set down for discussion.

Mr. CHARLES PINNIGER said the unprecedented dry season of 1870, which has just passed away, will not I imagine be soon or easily forgotten amongst us. Even the youngest in our midst will be able to relate in after years what one did to get food for his cattle; what another did for water for the same; and how all so ardently longed month after month for rain, and still none came of consequence all the summer or autumn long. From the record of the amount of rain I hold in my hand, I find the fall of rain for the twelve months has only been 19 inches 99 parts, the average for the twelve years past being very near 28 inches for the same period. The months of April, May, and June were exceedingly dry, only 1

inch 89 parts of rain falling during those months, and those in which our hopes principally depend for our hay crop. The drought which set in as early as the middle of March, has continued with but little intermission up to the present time, and even on the 9th day of January, 1871, we find many of our ponds which were quite dry in the middle of summer, and were newly cleaned and dug out, nearly empty, and the ditches, which are usually at this season full to overflowing, are now comparatively dry. The natural consequence of such a very long term of drought has been to absorb all the farmer's profits and a very great deal of his care too. One friend informs me he is nine tons of cheese short of his usual make, which, reckoned at £70 per ton, amounts to £630. The pastures in these and adjacent valleys, usually so rich and fertile, were suddenly brought to a standstill, and vegetation at the time when the hope of the husbandman is on the alert for the return of summer was at once cut short by cold, cutting easterly winds, with a total suspension of any rainfall of importance for many months together, with the certain result of

the loss of our hay crop, as well as the equally calamitous prospect of starvation of our herds and our flocks. As I said before, these pastures, deemed so fertile and productive induced the yeoman to hope he might venture to lay stock on it thickly, with a view of profits to meet the heavy demands on it of rent tythes, rates, taxes, and labour, and experience of former years has generally borne him out in his expectations. This very exceptional year has doomed him to disappointment and dismay, and here we are at the present time with our usual number of cattle (for to sell out would be more disastrous), our stock of provender for them of the most meagre description, and our hay-stacks a thing of the past. I have myself five stackyards, where I usually put a hay rick, but which now have none at all in, and another or two would be nearly the same but for a little left of the previous year's growth. Our hopes, then, of getting through this severe winter without a very heavy outlay of money or ruin of our cattle are faint indeed, and may well induce a meeting such as this to consider what under the circumstances is best to be done, or, as our text says, "How best to economise and make the most of what we have." There is one consolation under it. It is generally, I believe, admitted our crop of straw is nearly, if not quite, an average one. More particularly is this the case of wheat-straw, the quality of which is first-rate; so much so we scarcely ever knew it so good, and here in a great measure must be our dependence for the saving of the lives of thousands of our cattle, and sheep too. Well, then, how best to consume so as to make the best of this very valuable material is the question each one appears to be asking the other, and on which each one is desirous of being better informed. That there is a mode of rendering straw really nutritious there is but little doubt; at all events, we can so supplement it with other matter that it can be made an exceedingly valuable adjunct to our usual resources. Indeed, I must say I have positive proof of it daily before my eyes. But as our esteemed friend, Joseph Reynolds, of Gloucester, on a similar discussion to this, once hinted to the Chamber, it is not by putting out your cows for 12 weeks on board wages in other persons' yards at 1s. 6d. per head that you will succeed. But the best method appears the most difficult one to arrive at. Some gentlemen informed me that the farmers in the neighbouring county, diluted or moistened their wheat straw cut into chaff for the cattle with cider, having had a very bountiful crop this season. Another informs me that in another county farmers cut up their wheat and other straw and mix with it a quantity of salt and lay it up in store for winter when it comes out a really fattening substance. This may, to a certain extent, be a palatable, but, I imagine, not very nutritious food. Another gentleman informs me he cuts his straw into chaff three quarters of an inch in length, and sweetens it with treacle and water at the rate of one pound of the former to each animal per day, and this with satisfactory results. I am very fearful in instances like this; the palate of the animal is better pleased than the system is fed, and the belly of the animal is made to grow big while the back grows very thin. Another gentleman assures me his cattle do exceedingly well on cut straw and 4lb. of palm-nut meal each per day, at £8 per ton, spread over the chaff, the straw cut the same lengths as in former cases. Now this must be a very cheap mode, and will well compare with any one I have met. I am not quite sure if he informed me whether his cattle were in-calf cows or barren stock. Much, however, is involved in this. With our dairy cows within four, six, or eight weeks of their calving time, the same dry husky food they did on three months ago they can barely subsist on now—that is if you wish to keep the back of the animal big, the twist full and plump, and the cow strong and vigorous to bring forth her young in due season and healthfulness. Now if this mode of 4lb. of nut-meal will effect all this, which, permit me to say, I very much doubt, it must be economical, because 4lb. of this preparation at £8 per ton will cost only 4d. per day or about 2s. 3d. per week, in addition to 2 cwt. of cut straw at 3s., which makes it up to 5s. 3d. each per head per week. Supposing that ten cows will eat 24 bushels of chaff or 1 cwt. of straw cut with a very little hay each, in addition to 4lb. of cake, this gentleman would get his cattle kept on palm-nut meal and cut straw at the price of 5s. 3d. each per week, which would be very cheap. Another gentleman, whom I consider a first-rate manager of dairy cows in winter, assures me he cannot in any season do it at less than 5s. per head; he says to do

your cow justice during the time of her rest eight or ten weeks she should have two cwt. of good useful sweet hay, which at the spending price, £2 10s. per ton, comes to the money. If you give half straw cut with it, you must make it up to her in cake, meal, or some other nutritious matter. Now, if instead of two cwt. of hay I give 1½ cwt. of straw at 3s., half cwt. of hay at 2s. 3d. (spending price £2 10s.) and a quarter of a cwt. of cake per week, I expend 8s. 4½d. per week. This looks a startling sum for 70 or 80 cows—it amounts for 80 cows to £34 per week, or very near it. But we now come to matters of fact. My friend, whom I will call A 1, informs me he has put off all his older cows to his arable farm at straw with one bushel of roots and 2 lbs. of cake per day, and this costs him, to receive anything for his straw, 6s. 6d. per head. Then he informs me he keeps his 45 grazer cows at home on cut straw and hay, half of each, moistened with porridge made of one bushel of linseed to 60 gallons of water, with the addition of 100 lbs. of pea and barley mixed and strained over the mass sufficient for two days or at the rate of a trifle more than 6 lbs. of meal per day to each cow. Now this, without hay and straw, costs 2s. 3d. per week or the cost of hay at 4s. 6d. spending price, and same of straw at 1s. 6d. comes to just 8s. 3d. each cow. These he says are just his youngest cows; for the older ones it would be scarcely enough. One thing must be borne in mind. For this mode of feeding he has capital premises and arrangements for doing it in this way. As he is a very methodical man, I get facts and figures from him correctly. One thing he says, he considers 2 lbs. of cake per day would be equal in nutriment to his gruel, &c., at a little more cost and a great deal less trouble, or very nearly 9s. per head each. I find our cows in the London dairy kept well on hay, grains, roots and cake, cost 12s. each per week. Another young friend on a farm of first-rate land, number of cattle much as usual, cows very poor, and looking half starved, dry ever since Michaelmas, and desirous of getting them up, is using his straw cut fine, mixed with linseed gruel, treacle, allowed to lay and get into a kind of porridge before being used. The cows eat it with the greatest avidity, and appear improving. He is pretty well off for old hay, yet he seems desirous of economising that, and his new too, by supplementing his straw, with cake, linseed, treacle, roots, and other matters. My method, though I may say I can scarcely strictly define one, has been to cut my straw and a very little hay by steam power into chaff, moistened with a little treacle, and served indiscriminately to all the stock. Two bushels of barley were boiled and thrown in with each day's mass for a time, but which we have now discontinued for other matters to make it up. In fact, I have, as I said, no definite scheme. I endeavour to watch my cattle, and by so changing and moving them about where necessary I endeavour to see all going on as well as under the circumstances we can, but we feed all indiscriminately on this chaff; the calving cows, young stock, and yearlings are indulged in extra cake, &c., as a make up with a few mangolds, and they appear to do exceedingly well. I do not see how one can classify them to different food, but I give to the classes most needing it an allowance of cake extra when required, the efficiency of which is most manifest in the way the cattle are doing compared with what they did other years when food was very abundant and no stint of it was given. I have made a few experiments in boiled linseed, treacle, &c., myself, and I am able fully to concur with the views of those of my friends I quoted before. The linseed, I believe, acts as an incentive, sweetened with treacle, to lead the animal to crave for it; though I do not see any beneficial results beyond that it helps (and this I consider a most essential thing) to assist in pushing these husky and clogging matters through the intricacies of the cow's stomach, which, to me, does not appear formed by nature to feed on the dry materials given to other of our domestic animals. I have also tried Messrs. Foster's compound, 6lb. of it against 4lb. of linseed and cotton cake mixed, on ten cows in calf. I must say I prefer the cake, though I do not notice any marked difference; they appear exceedingly fond of it. I have ordered a ton more. These and various other experiments have been tried, in all of which I have been anxiously watching for a more marked improvement than I have yet seen, prostrated as they are with this very rigorous season and the effects of the terrible infliction of the foot-and-mouth disease, from which we are barely recovered, and from which I do not expect to be fully rid of for a very long time to come. It is called by some one a ter-

rible scourge, and I fully endorse that opinion. I look upon it as one of the dairyman's greatest drawbacks, yet I do hope as we are now fully got into the swing of feeding our cattle, they look and do better than at any former time. For the last few months we seem to fully appreciate the worth of it, and have reconciled our minds to putting our hands into our pockets, to endeavour by so doing to make the most of what we have, and use to the best advantage what we have in the shape of fodder, whether for our sheep or cattle. Other friends of mine with a large stock of mangolds, pulp those and mix with their chaff or cut straw, but we all know this food wants the addition of a few pounds of cake or meal, or some other succulent food, a-day to do the animal justice, especially our cows forward in calf. Many will defend the system of giving wheat straw whole and not cut. With this I cannot possibly agree, when cattle have to get their entire sustenance from it. I am aware occasions may happen when it may be very beneficial, such, for instance, when we have a lot of old grass on the land. A little may then be eaten with it to help to fill up, and may prove of great good to cattle, as a person once said to me, "Straw may do very well if you can give them two meals of hay a-day beside." Of the different qualities of straw I am not prepared to speak very learnedly, though I think that barley or oat straw, of a light crop of say three quarters per acre, on stone brash or gravelly soils, is as good, if not better, than any other variety, either of which is no doubt very preferable to wheat straw. I think, however, from my own experience, there is a great deal of nutritive matter in bean or pea straw, or what we call "poulta," where the haulm of pea runs up the stalk of bean, which holding it off the ground avoids that dirt and filth peas in a wet season are liable to form, being so much on the ground. But all these are good, and much can be and is made of them, but they all require the addition of something of a more nutritious nature, if you intend doing justice to your cattle in the winter, or fitting your dairy cow to again resume her milk producing process with strengthened vigour. But I am inclined to think we, as a class, are apt to adopt a very parsimonious spirit to get all we can from poor Peggy, and leave her to take care of herself when her work is done, and she can do no more for eight or ten weeks in winter. The money once gone into our pocket is pulled out again with a very ill grace. I speak now for myself, and think it very hard we do not get fruitful seasons and abundant crops, and so avoid these heavy outlays for the sustenance of stock in winter, and why in the ease and jollity of our spirits we cannot every year say to our cattle, sheep, and horses, "Take your fill, eat, drink, and be merry." Yet, on the whole, I am inclined to believe these occasional dry seasons do us a vast deal of good. They tend to make us more careful of what we have, to point out to us the necessity of being more frugal in our management; to check speculation in our farms; and to observe greater economy in our products, not consuming all in an abundant season, but to lay by a store for a less productive one. The worst and most lamentable thing to me is it produces in us a sad murmur of discontent and dissatisfaction. All this I know too well myself, and I know, too, it is not our case alone. It is a national calamity. Every man who buys his pound of butter and has to pay 4d. extra for it has cause to lament it; or every man who has to pay 1½d. or 2d. extra for his piece of cheese, his beef, mutton, or bacon, may well see in it cause for discontent. Thanks, however, to our cousins in Ohio, Wisconsin, Illinois, and other States of the great Union across the water, who have sent us a good supply of cheese this season, they have much kept down the price of that article or it would have been much worse. As it is, however, the labourer, the mechanic, the artisan, or the private gentleman all feel the effects of this year of drought. Still, all would feel exceedingly thankful in contrasting our position with that of our less fortunate neighbours across the Channel, and will entertain a feeling of gratitude to the Great Disposer of all human affairs that matters are after all no worse than they are. One more word I wish to have with my young friends. It is this: Do not think too much of, or put too much dependence in, your stock of wheat straw. You have a few good-sized ricks in your stack-yard, and you fancy them almost inexhaustible. You have a great abundance there now, but nothing is more fleeting or deceptive. Why, one stack of hay of 30 tons will yield more fodder than the straw of 40 acres of wheat, and if you are very short of hay

I would advise you to purchase a little to cut up with your straw, and also spend a little on linseed, palm nut meal, barley, or peameal, so as to make the most of it, or you will find your wheat straw gone before you are aware, and then be obliged to go to the man of hay to buy, who will not forget to charge you for it when he sees you are obliged to come to him. It is a long tiresome time to wait with such scant provisions, and don't forget the old adage, "May come early or May come late will be sure to make the old cow quake." We remember the tale of the poor old Irish farmer, in a time of great distress—his hay and straw all gone, and nothing left for his poor old cow—who was lamenting it very sadly to his wife, when Biddy said, "Och John, don't ye fret John; shure I have some left for ye yet," and going into the sleeping apartment she flung out the children's chaff bed, saying, "Shure there is a store for ye yet, John; take that." Such extremities we hope not to see any of us driven to, though I am greatly mistaken if it will not be all got very close together before the usual season for grass comes round again, and the cuckoo's cheery notes usher in the commencement of returning plenty.

Mr. E. W. MOORE believed the result of the present state of things would be to lead farmers to make experiments with the view of discovering that they were not so dependent upon hay as they had hitherto thought they were. The fact was, they had all thought too much of that most expensive food for cattle—hay. They had thought too much about it, and had mown too much while they grazed too little. The present season, however, had compelled them to learn to do with less hay, and, in some cases, perhaps, to do without it altogether. What was more, he believed this lesson was being learned already, and he quoted, as a confirmation of his idea, the fact that hay was not increasing in price so much as they thought it would, and as much as it would have done had it been so generally used as formerly. This state of things was only to be attributed to practical men setting their wits to work, and by the use of artificials, as well as improved modes of preparing cattle food, relying less upon hay.

Mr. T. HEWER said he was one of those in the happy position of having a large herd to keep through the winter without having any hay, or at least only a very small quantity. He did not, however, despair, for he had plenty of wheat and bean straw, which, with a proper quantity of mangold, say half a bushel a day, also three or four pounds of palm-nut meal, and two or three pounds of cake, make up the keep of each animal per day. Very extravagant feeding it was too, as to cost, though it was not excessive in quantity. But the question was how to get on when the cows had calved, and there were no more hay ricks. In July, his pastures were very little better than a down, and he at this time gave his cows mangold leaves and straw cut up together. That food seemed to be very much liked by the stock, and did them good; and he was fortunate enough to make 3 cwt. of cheese per cow. He would venture to suggest that it would be an advantage if the Chamber could retain the services of a chemist to make analyses for the members at a reduced rate. Had there been such an arrangement he should have endeavoured to procure an analysis of mangold and mangold leaves, and thus learn the properties of each. Other members might also have other foods analysed.

Mr. J. HORTON said in the district where he lived the straw crop was not an average, the wheat being thin, and the kantar corn very deficient. He would, however, give to the meeting the result of the experience of himself and brother in endeavouring to ascertain the cheapest and best mode of keeping store cattle through the winter. They cut their straw into chaff, and then mix it with linseed gruel and meal. The quantity for each cow per day was 2lb. of linseed, ground and soaked in two gallons of water for 24 hours, then throw it over the chaff with 2lb. of meal, well mixed the day before using. The cost of each cow per week is 3s. 6d., estimating linseed at 8s. 6d. per bushel, and meal at 16s. per ten score. They gave the same to sheep, and kept them in a healthy state at 4d. per head per week. To horses for the night, after baiting, they gave more linseed and not any meal, and they very seldom heard of the horses having the gripes, which was very often the case when they ate dry provender. He could not see why farmers should pay to have the oil—which was so beneficial to the health of the stock—extracted from the lin-

seed, especially as manufacturers mixed such things as they often read were found in cake.

Mr. J. ARKELL said, while admitting the value of straw, he could not allow the merits of hay to be ignored; and, though perhaps straw had not been sufficiently valued, and might be used to greater advantage, there was nothing like a good bit of hay in the spring.

Mr. POOCK said he had spent a great deal in meal, Indian corn, linseed, &c.; he had used 20 sacks of linseed, and had to-day bought another 20 sacks and a quantity of cake. This he mixed together with rice meal. He used for each cow per day about half a peck of meal, 2lbs. of linseed, and 2lbs. of cake. He had the food prepared with care, and employed the best men he could to look after the cattle. There was just one point arising out of this state of affairs which ought not to be neglected. In spending all this money, tenants ought to feel they were doing so upon a satisfactory basis. Many farmers would be spending thousands this year in artificial food, which must improve the land; yet with some of them

this might be a complete loss as far as any future benefit was concerned, for they might get six months' notice to quit (prolonged applause). He might observe that he was a great advocate at one time for cutting chaff; he had, however, come to the conclusion that if a man had plenty of straw, it was cheaper to give the cattle four or five pounds of cake per day and let them pick the straw over, as they preferred this to eating a quantity of chaff.

Mr. T. ARKELL said he thought it better to use the straw whole, and let the cattle pick it out, spending the cost of cutting it into chaff in some useful artificial food. He further thought this was preferable to chaff, for the simple reason that animals which chewed the cud were not able to eat dry, short food like horses. There might be a little waste—that is to say some of the straw would be left by the cattle—but they would have manure, while the cattle would do better on whole straw than on so much chaff, and the labour of cutting it would be saved.

A vote of thanks was passed to Mr. Pinniger.

A DAY AT THE MELBOURNE CATTLE YARDS.

It is early morning—so very early indeed, that probably few persons wholly unconnected with live stock are moving; but at Newmarket, though the stars are still bright, though the masts of the ships in the bay barely pierce the mist in which their hulls are shrouded—all the population is energetic and alert as if three and four in the morning were the most ordinary of business hours. There are two yards or collections of yards, in the knoll, which has of late years become and been named Newmarket. In some defined relation to these “post and rail arrangements” stands every horse, dog, man, and boy—every cow, bullock, sheep, and lamb at present doing or suffering in their vicinity. These are the cattle-yards and sheep-yards respectively. All manner of lanes and by-roads from every point of the compass radiate towards Newmarket as a common centre. From these are debouching droves of cattle and flocks of sheep from every part of Victoria, and from many a plain and forest beyond the Murray. Thousands of fat sheep and lambs have come in by rail the night before, and are now moving in from paddocks where they have passed the night. The Newmarket Hotel is dispensing hot coffee, and occasional beverages of a “shorter” description, by the gallon. Weary men, with faces worn by hard weather and want of sleep, are “turning in” for a short doze, or “turning out” to begin the day's work. There is no other saleyard near Melbourne where sheep and cattle can be sold. This particular spot seems naturally adapted for the purpose to which it is devoted, and means have been taken to render it the most convenient, effective, and accessible stock mart in Australia. Nor is the landscape devoid of beauty. Eastward, at a distance of three miles, lie the spires and roofs of Melbourne. Beyond are forests, green-swarded, and, devoid of undergrowth, the blue ranges of Dandenong, and dimly distant, the snow peaks of the Australian Alps. Southward, the sun lights up the Bay of Williamstown, studded with masts and the sails of many nations. To the westward all is plain. From the spot on which we stand to where the southern surges break against the farms of Warramboul and Port Fairy, 200 miles in “a bee-line,” stretch the Western Plains, rarely broken by hill or forest. Northward, the eye, passing over many a league of park-like country, studded with farms, and wealthy in stacks and well-filled barns, rests on the bold outline of the far-known Mount Macedon. But while we are pouring out our soul in landscapes and such inutilities, see how the cattle mobs are moving on from every lane and by-way, and heading for the spacious receiving-yards. Yonder lot of splendid cattle have apparently come right through the city. Surely that cannot have been the case! It is even so. They are from Gipps Land, and since they left the rich meadows and forest parks of that favoured district have been undergoing a fortnight's purgatory (let us be mild) on the worst road for horse and man, cattle or coaches, in Victoria. They did pass through the city—through the most busy part of it, over Prince's Bridge, and straight up Elizabeth-street—after this wise: After leaving Dandenong, they prowl
